(i.) Payment to be net cash within 7 days of completion of delivery and moneys then unpaid thereafter to carry interest not exceeding the rate of £5 per centum per annum or bank rate, whichever shall be the higher.

(ii.) Delivery to be at the seller's expense to the buyer's nearest railway station or at the option of the seller to the buyer's premises.

(iii.) All cost of packing, packages and charges incidental thereto to be borne by the seller; except that the seller may make an additional charge for the cost of the packages in which the wild rabbits are packed; provided that such sum shall be repaid by the seller to the buyer on return of such packages in good condition to the seller's nearest railway station.

Where the contract is made on terms and conditions other than the above, a corresponding adjustment shall be made in the maximum price. In particular where any wild rabbits are sold carriage forward, the maximum price shall be decreased by a sum equal to the cost of such carriage.

4. (a) On the occasion of a sale by retail of any wild rabbits or part thereof the maximum price shall be the price applicable according to Part 3 of the Schedule.

(b) The maximum price shall include all cost of skinning, packing and packages and no charge may be made therefore or for giving credit.

(c) Where any wild rabbits are delivered at the request of the buyer otherwise than at the seller's premises, an additional charge may be made in respect of such delivery not exceeding a sum at the rate of $\frac{1}{2}$ d. per lb. or any larger sum properly and actually paid by the seller for carriage.

* * * * *

13. Nothing in this Order shall apply to :—

- (a) A sale of live rabbits ;
- (b) A sale of canned wild rabbits ; or
- (c) A sale of cooked wild rabbits by a caterer in the ordinary course of his catering business.

14. The Rabbits (Prices) Order, 1918,* is hereby revoked as at the 2nd September, 1918, without prejudice to any proceedings in respect of any contravention thereof.

The Schedule.

Maximum prices at the rate per lb. of :—

Part 1	6d.
" 2	8d.
" 3	9½d.

NOTE.—“ Wild Rabbits ” means all rabbits, whether imported or not, except rabbits proved to have been bred in captivity.

THE following Notice was issued by the Food Production Department of the Board towards the end of August :—

The restrictions placed upon the use of the
The Feeding of Lambs and Hurdle Sheep. limited supplies of feeding-stuffs available, and the exclusion of all classes of sheep from the list of animals for which oil-cakes, etc. can at present be obtained, are causing much concern to those who have been in the habit of feeding lambs and hurdle sheep. It may not be generally known that the use of oats, beans and peas is not restricted. Useful mixtures for the feeding of both lambs and older sheep may be made from these, and it will be found that such mixtures form valuable and effective substitutes for the feeding-stuffs commonly used for this purpose in the past. It is much to be hoped that every effort will be made to prevent any serious reduction in the number of sheep fed during the coming winter. The difficulty anticipated by sheep-feeders in fattening their stock next winter may be largely overcome by the skilful use of those home-grown foods upon which no restrictions have been placed.

AN Order (No. 936), dated 27th July, 1918, has been issued by the Food Controller, which takes effect from 29th July, restricting dealing in and the prices for certain varieties of

The Plums (Sales) Order, 1918.

plums. The fruits and growers' prices are as follows :—

Blaisdon	£40 per ton.
Bush plum or mogul	" "
Pershire or egg plum	£30 "
Gisbourne	" "

Dealers are allowed to add a commission of 30s. a ton, and provision is made as to packages and tolls on the lines laid down in the Soft Fruit Order.

An Order (No. 1054), dated 23rd August, 1918, has been made by the Food Controller to the effect that :—

The Damson (Sales) Order, 1918. On and after the 28th August, 1918, the provisions of the Plums (Sales) Order, 1918* (hereinafter called the Principal Order), shall apply to damsons in the same way as such Order applies to plums of the variety " Blaisdon " and so that the schedule price for damsons shall be £40 per ton, and in the application of Clauses 1, 2, 4, 6, 8, 10, 11 and 12 the date 28th August, 1918, shall be substituted for the date 29th July, 1918.

AN Order (No. 1,021), dated the 15th August, 1918, has been made by the Food Controller to the effect that :—

The Small Apple (Temporary Prices) Order, 1918.

1. For the purposes of this Order :—

The expression " small apples " shall mean all apples (other than apples of the varieties set out in the Schedule) which have been grown in the United Kingdom and which are capable of passing through a ring 2-inches in diameter.

The expression " licensed jam manufacturer " shall mean a person holding a licence from the Food Controller authorising him to purchase soft fruit for the manufacture of jam for sale.

The expression " recognised fruit salesman " shall mean a person who in the ordinary course of his trade buys fruit in wholesale quantities for re-sale, or sells on commission.

2. A person who grows any small apples shall not sell or deliver or offer to sell or deliver the same to any other person than :—

(a) A licensed jam manufacturer ; or

(b) A recognised fruit salesman who has given to the grower a dated and written undertaking signed by the salesman that he will re-sell such fruit only to a licensed jam manufacturer.

3. Where a recognised fruit salesman has bought from a grower any small apples, he shall not sell such apples except to a licensed jam manufacturer.

4. A licensed jam manufacturer shall not buy or take delivery of any small apples or use any small apples bought by or delivered to him for any purpose other than the purpose of manufacturing jam or pulp for sale.

5. Until further notice no small apples shall be sold by the grower thereof at a price exceeding £12 per ton f.o.r. ship, or barge, at the grower's station, port or wharf, together with the additional charges permitted by this Order. Such price shall include all charges for gathering and packing.

6. The additional charges permitted on a sale by the grower are :—

(a) Where the fruit is delivered by the grower to the buyer's premises or for sale in a market, the customary charges for such delivery not exceeding in any case an amount equal to the cost of transport from the grower's station, port, or wharf to the buyer's premises or the market in which the fruit is sold.

(b) Where packages are provided by the grower a charge not exceeding the rate of 40s. per ton of fruit for the use of pecks and strikes and half-sieves, and 25s. per ton of fruit for the use of other usual

packages (other than bags) and 10s. per ton for the use of bags. All pecks, strikes, half-sieves, bags or other packages to be returned to the grower carriage paid.

(c) All market tolls actually paid in respect of the fruit by the grower.

7. Until further notice no small apples shall be sold by any person other than the grower of the fruit sold at a price exceeding £12 12s. 6d. per ton, together with the additional charges permitted by this Order to be paid to the grower, to the extent to which the same are payable or have been paid, and together also with the following additions where applicable :—

(a) The amount of the transport charges, if any, paid or payable by such person in respect of the fruit and not included in the sum paid to the grower ;

(b) The amount of any market tolls actually paid by such person in respect of such fruit ; and

(c) A sum at the rates and on the terms set out in Clause 6 (b) hereof in respect of packages provided by such person.

8. Except in such cases as the Food Controller may otherwise determine, all contracts subsisting on the 19th August, 1918, for the sale of small apples grown or to be delivered in the United Kingdom shall be cancelled so far as the same relate to small apples not delivered before that date.

THE SCHEDULE.

Beauty of Bath, Benoni, Ben's Red, Cox's Orange Pippin, Devonshire Quarrendon, Duchess' Favourite (syn. Duchess of Gloucester), Duchess of Oldenburgh, Feltham Beauty, Gladstone, Hunt's Early, Irish Peach, James Grieve, Juneating (red and white), King of the Pippins (syn. Princess Pippin), Lady Sudeley, Langley Pippin, Miller's Seedling, Worcester Pearmain, Yellow Ingestrie.

AN Order (No. 1,053), dated 23rd August, 1918, has been made by the Food Controller to the effect that :—

The Blackberries 1. No blackberries or pulp made from blackberries shall be used for any purpose
Order. other than as an article of food or in the manufacture of an article of food.

2. A person who, for the purpose of sale, manufactures jam, or bottles, or otherwise in any form preserves blackberries (hereinafter called a jam manufacturer), shall not by himself or his agent buy or agree to buy for the purposes of such manufacture or preserving any blackberries at a price exceeding £42 per ton, or pay to the seller or his agent in respect of such fruit any charges other than those permitted under this Order. The maximum price under this Clause includes all charges for picking and packing.

3. The additional charges permitted on a purchase to which Clause 2 applies are :—

(a) Where fruit is delivered to the buyer's premises or for sale in a market the customary charges for such delivery, not exceeding in any case an amount equal to the cost of transport to the buyer's premises or the market in which the fruit is sold from a railway station, port or wharf, near the place where the fruit was grown ;

(b) Where packages are provided by some person other than the jam manufacturer,

(i.) A charge not exceeding the rate of 40s. per ton of fruit for the use of pecks, strikes and half-sieves, and 25s. per ton of fruit

for the use of baskets or other usual packages (other than chip baskets and punnets). All pecks, strikes, half-sieves, baskets, or other packages to be returned carriage paid.

- (ii.) A charge not exceeding 40s. per ton of fruit delivered in chip baskets or punnets, the chip baskets and punnets to be non-returnable.

4. (a) A person shall not sell by retail or offer or expose for retail sale or buy or offer to buy by retail any blackberries at a price exceeding 4d. per lb.

(b) No addition shall be made to the price fixed by this Clause in respect of picking, packages, giving credit or making delivery.

5. Where any blackberries to which this Order applies are bought by or on behalf of a jam manufacturer, such blackberries shall until the contrary be proved be deemed to be bought for the purposes of manufacturing jam or preserving blackberries for the purpose of sale.

6. A person shall not sell or buy, or offer to sell or buy, any blackberries at a price or make any payment in excess of the prices permitted by this Order, or in connection with the sale or disposal of any such fruit enter or offer to enter into any fictitious or artificial transaction.

THE Ministry of Food have made the following arrangements for the opening of the Game Season :—

The Supply of Game for Food.

Applications for permission to purchase shot-gun cartridges are to be made on Form S.C. 2, obtainable at the gun-makers. On £1 game licences, 300 cartridges are obtainable ; on £2 or £3 game licences, 500 cartridges are obtainable.

Applications for soft-nosed rifle cartridges should be made on D.R. Form 23 B., which is obtainable at the gun-makers, and must be sent by applicants personally, and forwarded for approval and registration in the case of cartridges required for use in England and Wales to the Secretary, Venison Committee, 100, Cromwell Road, London, S.W. 7, and in the case of cartridges required for use in Scotland to the Secretary, Board of Agriculture for Scotland, 29, St. Andrew's Square, Edinburgh.

Table of Coupon Rates for Game and Venison.—The following are the rations which have been fixed for self-suppliers, direct supplies, and customary gifts :—

Description of Animal.	Value of Meat when Consumed by Self-suppliers.	Value of Meat for Direct Supplies.
Rabbits and Hares.	Ration free.	Skinned rabbit up to 1½ lb., 1 coupon. Unskinned rabbit up to 2 lb., 1 coupon ; all other rabbits, 2 coupons. Parts of rabbits, 1 coupon per 1½ lb. Rabbits received as free gifts. Ration free. Blue hares or leverets, 2 coupons. Brown leverets, 3 coupons. Brown hares, 4 coupons.

Type of Game.	Value of Meat for Self-suppliers.	Value of Meat for Direct Supplies.
Venison	1 coupon per 2 lb. meat. Offal ration free.	1 coupon per 1 lb. of meat. Offal ration free.
Pheasants, wild duck, guinea fowl and capercaillie ..	1 coupon for every 2 birds.	1 coupon per bird.
Grouse, partridges, black game, wid- geon	1 coupon for every 4 birds.	1 coupon for every 2 birds.
Teal, Ptarmigan, woodcock	1 coupon for every 8 birds.	1 coupon for every 4 birds.
Plover	1 coupon for every 12 birds.	1 coupon for every 6 birds.
Quail and Snipe ..	1 coupon for every 16 birds.	1 coupon for every 8 birds.

Customary Gifts.—On the basis of direct suppliers in all instances, and the recipients will be responsible for detaching their coupons.

Price of Grouse and Black Game.—The following prices have been fixed for grouse and black game :—

Young birds hatched in the year 1918, and sold prior to 1st November, 1918, not exceeding for any one bird, 4s. 3d. to the retailer, 5s. 6d. to the consumer.

All other grouse and black game, not exceeding for any one bird, 2s. 6d. to the retailer, 3s. 3d. to the consumer.

Carriage of Game to Market.—The Ministry of Food are advised that the owner of a deer forest for shooting who disposes of his game or venison for public consumption is entitled to be regarded as carrying on a trade or business within the meaning of paragraph 3 A (2) of the Motor Spirit (Consolidation) and Gas Restriction Order, 1918, and that a privately owned car can therefore be used for the carriage of game or venison to market if the journey cannot otherwise be reasonably and conveniently accomplished. A privately owned car cannot, however, be used in the same way as a trade vehicle, as the latter may be used for any trade purpose whether or not the journey can be otherwise reasonably and conveniently accomplished. The Petrol Controller will be prepared to consider any application approved by the Ministry of Food for an increased allotment of petrol for the purpose of transporting dead game to the nearest available market or centre of distribution where other transport facilities are not available. Such applications should be made through the Divisional Food Commissioners for the area concerned.

Position of Persons taking Shootings.—The question has been raised in several quarters as to the positions of persons who propose to take shootings. In dealing with enquiries, Committees should make clear the point that *the person taking the shooting will be responsible for detaching coupons only in respect of game consumed in his household.* As regards game sent by him to friends, the head of the household in which the game is consumed will be responsible for detaching and keeping the coupons at the direct suppliers' rate. If the game is given to employees living outside the household, entitled to rank as self-suppliers, consumption is accounted for at self-suppliers' rates, and it is the employee who is responsible for detaching the coupons.

The date of the shooting season for grouse and black game commences on 6th August, 1918.

Self-Suppliers' and Direct Supplies.—The following important alterations should be noted in the existing regulations as to consumption of home-produced rationed foods :—

Self-Suppliers' Poultry.—Owners of 50 head or less of poultry will not be required to keep records of consumption. Persons owning fowls will be entitled to consume free of the ration one bird per week for every four people or less in the household.

Use of Coupons.—In accounting for the home consumption of rationed foodstuffs, the self-suppliers are not confined to the coupons numbered to correspond with the week in which the food has to be accounted for, but may use either previous or subsequent coupons in addition to the current ones. The head of the household will be responsible for detaching the correct number of coupons corresponding to the amount of meat consumed and for preserving them for production to the Food Control Committee when required.

Direct Supplies.—Direct supply permits and certificates to the producer to the effect that the consumer will refrain from purchasing rationed foodstuffs to the extent of his direct supplies are no longer required.

Table of Coupon Rates for Domestic Birds.

Description of Animal.	When Consumed by Self-suppliers.	When Consumed as Direct Supplies.
Fowls and Chickens	Consumption ration free : up to limit of one bird for a household of 4 persons (or less) per week ; 2 birds a week for a household of more than 4 and not more than 8 persons. etc. For consumption in excess of this rate, 1 coupon per bird.	1 coupon per bird up to 3 lb. 2 coupons per bird up to 5 lb. 3 coupons over 5 lb.
Domestic Ducks and Geese.	Ducks—1 coupon per bird Geese—3 coupons per bird	1 coupon per bird up to 4 lb. 2 coupons per bird up to 6 lb. 1 additional coupon for every 2 lb. up to 16 lb. 8 coupons per bird over 16 lb.
Turkeys ..	3 coupons per bird ..	3 coupons per bird up to 6 lb. 1 additional coupon for every 2 lb. up to 14 lb. 8 coupons per bird over 14 lb.
Domestic Pigeons	1 coupon for each 9 birds	1 coupon for each 6 birds.

The weights of poultry are to be taken without feathers, but with all offal.

Butter consumed by a self-supplier can be consumed at the rate of 8 oz. per head per week in place of 5 oz. (the usual rate).

Wood pigeons, rooks and other birds not included in the above tables and goats are ration free.

It has been officially decided that the concession made on 5th July, 1918, by which, in order to facilitate the sale of poultry arriving in public markets in a faulty condition, retailers were empowered (subject to limitations as to price) to sell such poultry free of the coupon, shall be extended to all poultry which is sold by the retailer at a price not exceeding 1s. 4d. per lb. This further concession came into force on 12th August, and will continue until further notice.

An Order (No. 976), dated 31st July, 1918, has been made by the Food Controller to the effect that :—

**The Butter Order,
1918.**

1. A person shall not sell or offer or expose for sale or buy or offer to buy any butter at prices exceeding the maximum prices applicable under this Order.
2. The maximum prices shall be such prices as the Food Controller may from time to time prescribe by notice under this Order and until further notice shall be the prices hereinafter provided.
3. (a) On the occasion of a sale (other than a sale by retail) of British-made butter by or on behalf of the maker or the blender thereof, the maximum price shall be as follows :—

- (i.) If the butter be sold in rolls, bricks, prints or pats of 1 lb. weight or less, at the rate of 2s. 1½d. per lb. ;
- (ii.) In any other case, at the rate of 2s. 1d. per lb.

Provided that, where the buyer declares in writing that he is buying such butter for re-sale to a retail dealer, the prices applicable under this Sub-clause shall be reduced by a sum at the rate of 1½d. per lb.

(b) The prices fixed by this Clause are prices ex creamery, factory, farm or blender's premises and include all charges for packages, packing and credit.

4. (a) On the occasion of a sale of British-made butter (not being a sale by retail or a sale to which Clause 3 applies) or on the occasion of a sale of Government butter (not being a sale by retail) the maximum price shall be as follows :—

- (i.) If the butter be sold in rolls, bricks, prints or pats of 1 lb. or less, at the rate of 2s. 1½d. per lb.
- (ii.) In any other case, at the rate of 2s. 1d. per lb.

(b) The maximum prices fixed by this Clause are fixed on the basis that the cost of packing and packages and the cost of delivery to the buyer's premises is included in the price.

5. (a) On the occasion of a sale to which Clause 4 applies, the terms of sale shall be at the seller's option either ;

- (i.) Payment before delivery, with discount at the rate of 5 per cent. per annum, for two months ;
- (ii.) Payment within 7 days of date of invoice, with discount at the rate of 5 per cent. per annum for two months ;
- (iii.) Payment after 7 days of date of invoice, with discount at the rate of 5 per cent. per annum for the unexpired portion of two months, and 3 days from the date of invoice.

(b) For the purposes of this Clause "date of invoice" shall mean the date of despatch of the goods to the buyer, or the date borne by the invoice, whichever shall be the later, excepting in cases where butter is detained pending buyer's instructions, in which case it shall mean the date when the goods were ready for despatch to the buyer.

6. (a) On the occasion of a sale by retail of any butter, the maximum price shall be at the rate of 2s. 4d. per lb. except that in calculating the maximum price chargeable on any sale any broken halfpenny included in the maximum price shall count as a halfpenny.

(b) No charge may be made for packing, packages or giving credit, but if the butter is delivered at the buyer's request, otherwise than at the seller's premises, an additional charge may be made for such delivery not exceeding a sum at the rate of $\frac{1}{2}$ d. per lb. or any larger sum actually and properly paid by the seller for carriage.

7. A Food Committee may from time to time by resolution vary the maximum price for butter sold by retail within their area or any part of such area ; but

(a) Every such resolution shall be reported to the Food Controller within 5 days and shall not take effect until three days after the same has been sanctioned by the Food Controller ; and

(b) Every such resolution of a Food Committee under this Clause shall be subject at any time to review by the Food Controller and shall be withdrawn or varied as he may direct.

8. On the occasion of a sale of any butter, the seller shall deliver to the buyer an invoice stating accurately the description of the butter as Government or British-made butter, as the case may be, the price charged and the quantity sold, and the invoice shall also state whether the butter sold in prints, pats, bricks, or rolls of 1 lb. or less or otherwise. Provided that no such invoice need be given upon the occasion of a retail sale unless the buyer demands the same.

9. A person shall not in connection with any sale or disposition or proposed sale or disposition of butter, enter or offer to enter into any artificial or fictitious transaction or make or demand any unreasonable charge.

10. Nothing in this Order shall apply to the sale of any butter by a caterer in the ordinary course of his business as part of a meal.

11. Infringements of this Order are summary offences against the Defence of the Realm Regulations.

12. For the purposes of this Order " Government Butter " means—

(a) All butter (whether made in the United Kingdom or imported) which is from time to time distributed for sale in Great Britain by the Food Controller under the Butter (Distribution) Order, 1917, or under any directions or regulations given or made or to be given thereunder ; and

(b) All butter made, blended or collected by any blender holding a licence as such issued by or under the authority of the Food Controller. " British made butter " means all butter other than Government Butter.

13. The Butter (Maximum Prices) Order, 1917,* as amended by the Butter (Maximum Prices) Amendment Order, 1917,† and the Directions, dated 22nd June, 1918, under the Butter (Distribution) Order, 1917, are hereby revoked as from the 7th August, 1918, but without prejudice to any proceedings in respect of any contravention thereof.

NOTE.—This Order came into force on 7th August, 1918, and does not apply to Ireland.

* Order No. 913, 1918, printed in this *Journal*, September, 1917, p. 678.

† Order No. 1,110, 1918, printed in this *Journal*, November, 1917, p. 906.

MR. J. R. CLYNES, M.P., the Food Controller, referring to a published statement with regard to the rationing of cheese, explains that the reason which has guided the Ministry in deciding not to enforce an individual ration is, in effect, that equality in the distribution is not desired. Broadly, the scheme for distribution which has now been settled and which is to be brought almost immediately into operation provides :—

Reasons for Control of Cheese.

- (1) That the larger proportion of cheese would go into mining and certain other areas where it is a staple article of food.
- (2) That special facilities should be arranged whereby agricultural labourers should receive supplies of cheese from their employers at first-hand prices.
- (3) That the Local Food Committees should obtain returns of the quantities of cheese going into their area, and if it is found there has been any appreciable increase in the population of that area these supplies should be proportionately increased.

The Ministry are hoping that the scheme framed on the above lines will meet the situation. Any scheme of rationing would involve supplying cheese to people who did not want it at the expense of those to whom it was almost a necessity.

AN Order (No. 4,071), dated 28th August, 1918, has been made by the Food Controller to the effect that :—

**The Rats Order,
1918.**

1. Where a local authority are of opinion that rats are causing preventable damage or destruction to foodstuffs within their district they may take such measures as they shall think proper for the destruction of such rats.

2. (a) Where a local authority are of opinion that the owner or occupier of any lands or buildings has neglected to take reasonable and proper precautions to prevent such lands or buildings becoming infested by rats, or has neglected to remove from such land or buildings any rubbish or other materials likely to attract rats, they may give to such owner or occupier directions requiring him to take such steps as in the opinion of the local authority are reasonable and proper for the purpose of preventing such lands or buildings being infested by rats or requiring him to remove or destroy such rubbish or other materials.

(b) It shall be the duty of such owner or occupier to comply with all such directions, and where in the opinion of a local authority the owner or occupier of any land or building has failed to comply with any such directions within 7 days of the same being given or such later period as may be specified by the local authority, they may enter on such land or buildings, and take such measures as are enjoined by such directions and may recover from such owner or occupier any expenses incurred by them so far as such expenses are directly attributable to the failure of such owner or occupier to carry out his obligations under those directions.

3. A local authority in the exercise of the powers conferred by this Order shall have regard to any recommendations which may be made to them in England and Wales by the Board of Agriculture and Fisheries or a War Agricultural Executive Committee in the area of the

local authority and in Scotland by the Board of Agriculture for Scotland or a District Agricultural Executive Committee acting in the area of the local authority.

4. A local authority in England or Wales and any person authorised by them are hereby authorised to prosecute any offence against the Defence of the Realm Regulations occasioned by a breach of this Order.

5. Failure to comply with this Order or any direction given thereunder is a summary offence against the Defence of the Realm Regulations.

6. For the purposes of this Order, the expression "foodstuffs" shall include growing crops, but this shall not be construed so as to limit the general interpretation of that expression.

The expression "local authority" shall mean, as regards England and Wales, a county council or the council of a county borough; and, as regards Scotland, a county council or a town council.

7. (a) This Order may be cited as the Rats Order, 1918.

(b) This Order shall not apply to Ireland.

THE following Notice was issued by the Food Production Department of the Board on 30th August :—

**Caterpillar
Plagues and their
Prevention.**

If all fruit growers would combine in a great preventive campaign against fruit tree pests we should be insured against a repetition of this year's plague of caterpillars, which caused such havoc in our gardens and orchards. It cannot be too often stated that the greater part of the ills that afflict our garden, market garden, and orchard crops can be obviated by preventive measures taken in due season. If we wish to be saved from a plague of caterpillars next spring and summer we must grease-band our standard and half-standard fruit trees now and take other precautions during the winter and spring.

As soon as possible, and at latest not later than the end of September, the grease-bands should be applied, for early in October the wingless females of the winter moth family begin to crawl up the trunks of the trees and to lay their eggs on spurs and twigs. In the spring these eggs will hatch into small caterpillars, and these caterpillars will soon strip the trees of their leaves, to the great detriment of the immediate fruit crop and the eventual health of the tree. The best method of preventing these lamentable results is to tie bands of stout grease-proof paper smeared with a sticky preparation sold for the purpose round the trunks of the trees. The moths attempting to climb the trunks become entangled in the "grease bands" and die. The grease should be smeared every four or five weeks when the outside surface has become dry from exposure.

For further information on this subject apply to the Food Production Department, 72, Victoria Street, S.W. 1, or write to the Board of Agriculture, 3, St. James's Square, S.W. 1, for copies of F.P. Leaflet No. 12 (*Grease Banding of Fruit Trees*), and Leaflet No. 4 (*Winter Moths*).

Readers will be well advised to purchase the necessary materials at once.

ACCORDING to a Preliminary Statement issued by the Board of Agriculture and Fisheries on 27th August, the returns of acreage and live stock collected on the 4th June last show that the total arable area in England and Wales this year is 12,398,730 acres, representing an increase of 1,152,620 acres or 10 per cent. over the arable area of 1917. This is the largest area returned for the past twenty years. The area under permanent grass is 14,588,900 acres, a decrease of 1,246,470 acres on the year. The total area under crops and grass thus amounts to 26,987,630 acres, as compared with 27,081,480 acres in 1917.

The greater part of the grass-land ploughed up has been placed under wheat and oats. The increase in the area under Wheat is 638,260 acres, or 33 per cent., and the total now under this crop amounts to 2,556,740 acres, which is the largest since 1884. Oats this year cover 2,778,980 acres, the largest on record, and 520,070 acres (23 per cent.) more than last year. The other corn and pulse crops also show increases; Barley by 42,000 acres, Rye by 45,000 acres, Beans by 40,000 acres, and Peas by 19,000 acres. To these cereal areas there have to be added 141,580 acres under Mixed Corn now for the first time separately distinguished, the returns of such crops having previously been divided between the various corn crops, according to the kinds grown.

The total area under Corn and Pulse (wheat, barley, oats, rye, beans, peas and mixed corn) this year thus amounts to 7,481,000 acres as compared with 6,035,000 acres in 1917; an increase of 1,446,000 acres or 24 per cent., and the largest area under corn since 1879.

Potatoes have been increased by 125,850 acres, or 25 per cent., and the total area (633,840 acres) is much the largest on record. Most other crops naturally show a decline, especially Turnips and Swedes, which are reduced by 6 per cent., and are the lowest on record; but the Mangold area is slightly greater, and Flax this year covers 18,400 acres—more than 7 times the area of last year, and the largest but two (in 1869 and 1870) for the past 50 years.

The area under Clovers, Sainfoin, and Rotation Grasses has been reduced by 400,000 acres (16 per cent.), and the total (2,095,000 acres) is the smallest on record. Of this 1,446,500 acres were reserved for hay; this also being the smallest ever returned, and representing a decline of 235,000 acres on the year. Of the permanent grass 4,300,000 acres (nearly half a million less than last year) were reserved for hay. The total Hay area thus amounts to not quite 5,750,000 acres, or 730,000 less than in 1917, and the smallest since 1885.

Horses on agricultural holdings are practically unchanged, being just 3,000 more than last year. There is an increase of over 3 per cent. in the number used for agricultural purposes, but a decline in the younger unbroken classes. The total of Cows and heifers, in milk or in calf, is 2,578,000, is 113,000 more than last year, and the largest on record, being nearly 100,000 more than the previous highest (1914). The increase occurs in all categories of the dairy herd, but chiefly among the cows in calf but not in milk. Beef cattle, however, show a decline, particularly the older groups, and the total of all Cattle 6,200,000, is some 27,000 less than the record total of last year. Sheep show a considerable reduction, in spite of a small increase in lambs; the total, 16,475,000, is 4 per cent. less than last year, and (like the ewes) repre-

sents the smallest number ever kept, so far as the records show, while the number of lambs is the lowest since 1883. Pigs show a decline of 220,000 (over 11 per cent.); and the total of 1,697,000 is the lowest on record. The decline is, however, entirely among "other pigs" as breeding sows show a material increase of 35,000 or 14 per cent.

PRELIMINARY STATEMENT for 1918, compiled from the Returns collected on the 4th June; and comparison with 1917.

THE Agricultural Wages Board have commenced, as from the 15th August, 1918, the issue of a bi-monthly publication entitled the *Wages Board Gazette*, to appear on the 1st and 15th

The "Wages Board Gazette." of each month. The object of this publication is to enable farmers, agricultural workers and others interested to keep informed of the

Orders and Proceedings of the Agricultural Wages Board. The Gazette will contain particulars of the work of the Board and of the District Wages Committees, summaries of the current statutory notices of proposals to fix minimum rates of wages and also of the rates actually in force in different parts of the country, as well as explanations of the meaning and effect of the Board's Orders and Proposals, and other general information in connection with the Board's work.

The Gazette may be obtained at the office of the Agricultural Wages Board at the price of 1d. per copy (or 1½d. post free). Subscription rates will be 9d. per quarter and 3s. per annum (post free).

THE Board have recently added the following to their series of miscellaneous publications. Copies of these publications may be

**Miscellaneous
Publications of the
Board.**

obtained on application to the Secretary,
Board of Agriculture and Fisheries, 3, St.
James's Square, London, S.W. 1, at the prices
stated (which include postage) :—

No. 20.—*Poverty Bottom: An Experiment in Increased Food Production* (16 pages).—This is a reprint (illustrated) of an article which appeared in this *Journal* for February last, and is an account of an experiment over seven years made by Professor Somerville with a view to increasing the productivity of poor Sussex down land by the application of scientific principles and by business management. Price 2d.

No. 21.—*Report on the Occurrence of Insect and Fungus Pests on Plants in England and Wales in the Year 1917* (32 pages).—This is a summary of information as to the prevalence of insect and fungus pests in England and Wales during 1917, and is intended for the use of experts and those who are studying the subject. Price 2d.

No. 22.—*Rats: How to Exterminate Them: and the Taking of Wild Rabbits* (48 pages).—This is a reprint (well illustrated) of four articles by Mr. R. Sharpe which have appeared in recent issues of this *Journal*. Price 6d.

THE Board desire to correct an error which appeared under the heading "Women's Work on the Land," on page 332 of the *Journal* for June last. The words "East Sussex" mentioned therein should read "West Sussex."

**Women's Work on
the Land:
A Correction.**

Dingwall.—For failing to take reasonable precautions against rats, mice, rooks and jackdaws, whereby twelve stacks of oats and barley were partially rendered unfit for human food, a Black Isle farmer was fined £20.

**Prosecutions of
Farmers, etc., under
Statutory Rules
and Orders.**

Penryn.—John Brooks, of Penwerris Farm, near Falmouth, £20. for feeding wheaten flour to pigs. (*National Food Journal*, 14th August, 1918.)

Shap.—Robert Waiting, farmer, Melkinthorpe, who did not appear, and who had said to a police officer, "I am going to fill in no more forms; I put the thing on the fire," was fined £20 and costs, with the option of two months' imprisonment, for neglecting to make a return of live stock. (*National Food Journal*, 24th July, 1918.)

Barrow.—Seventeen farmers, on sales of milk to dealers, £12 to £16; a total of £218.

Chichester.—For feeding carriage horses with a mixture that contained oats Mr. A. H. Tennant, Adsdean House, was fined £20.

Doncaster.—For failing to register a flour mill and for grinding wheat unregistered, Willis Helliwell, farmer, Harlington, was fined 18 guineas, including costs.

Glasgow.—Robert Kerr, Spital Farm, Rutherglen, on wholesale sales of milk at 1s. 8d. per gal., £20.

Newmarket.—A fine of £75 was inflicted on Frank Halls, farmer, Cheveley, for selling adulterated milk. Analysis of three samples showed respectively, 11, 36 and 47 per cent. of added water. (*National Food Journal*, 28th August, 1918.)

MISCELLANEOUS NOTES.

THE *International Crop Report and Agricultural Statistics* for August, 1918, published by the International Institute of Agriculture, gives particulars concerning the production of the

Notes on Crop Prospects and Live Stock Abroad.

cereal crops of 1918 in certain countries in the Northern Hemisphere. *Wheat*—The production in Canada, United States, British India, and Tunis is estimated at 190,571,000 qr. in 1918, against 158,803,000 qr. in 1917, or an increase of 20.0 per cent. *Rye*—The estimated production in Canada and the United States is placed at 9,363,000 qr. this year, or an increase of 25.4 per cent compared with last year, when it amounted to 7,465,000 qr. *Barley*—The production in Canada, United States, and Tunis is estimated to amount to 39,247,000 qr. in 1918, against 32,666,000 qr. in 1917, or an increase of 20.1 per cent. *Oats*—It is estimated that the total yield in Canada, United States, and Tunis will amount to 194,115,000 qr. in 1918, against 207,068,000 qr. in 1917, or a decrease of 6.3 per cent. *Maize*—The production in the United States is estimated at 348,616,000 qr. this year, against 368,501,000 qr. last year, or a decrease of 5.4 per cent.

Canada.—The High Commissioner for Canada has received a report issued by the Dominion Bureau of Statistics, based upon returns made at the end of July, estimating the total yield of wheat for 1918 at nearly 232,000,000 bush. as compared with 233,742,850 bush. in 1917, and the yield of oats at about 416,000,000 bush. as against 403,000,000 bush. last year. (*Broomhall's Corn Trade News*, 24th August, 1918.)

United States.—According to the report issued by the Bureau of Statistics of the Department of Agriculture, the following are the estimated yields of cereals for the present year as indicated by the condition of the various crops on 1st September. (The final official returns for last year are given in brackets):—Winter wheat, 556,000,000 (418,070,000) bush., being an average yield of 15.3 (15.2) bush. per acre; spring wheat, 343,000,000 (232,758,000) bush., or 15.2 (12.6) bush. per acre; all wheat, 899,000,000 (650,828,000) bush., or 15.3 (14.2) bush. per acre; barley, 236,000,000 (208,975,000) bush., or 25.9 (23.7) bush. per acre; oats, 1,477,000,000 (1,587,286,000) bush., or 33.2 (36.4) bush. per acre; maize, 2,672,000,000 (3,159,494,000) bush., or 23.5 (26.4) bush. per acre; rye, 77,000,000 (60,145,000) bush., or 14.1 (14.7) bush. per acre; linseed, 16,000,000 (8,473,000) bush., or 8.1 (4.7) bush. per acre. The condition of crops on 1st September was as follows (the average of the previous ten years in brackets):—Spring wheat, 82.1 (72.0); barley, 81.5 (77.6); oats, 84.4 (77.6); maize, 67.4 (74.7); linseed, 72.6 (74.4). (*The London Grain, Seed and Oil Reporter*, 9th September, 1918.)

Brazil.—According to a report by the American Vice-Consul, dated 1st July, the Minister of Agriculture estimates this year's crop of beans at 350,000 tons. Before the war Brazil imported large quantities of beans, but domestic production now meets the demands of the country and leaves an exportable surplus. (*The London Grain, Seed and Oil Reporter*, 3rd September, 1918.)

India.—According to the final revised official estimate the area sown to wheat in India is given as 35,497,000 acres, and the yield as 47,478,000 qr. The special official forecast received in June gave the area as

35,342,000 acres and the yield as 47,525,000 qr. Last year's yield was 47,425,000 qr. (*The London Grain, Seed and Oil Reporter*, 23rd August, 1918.)

Japan.—According to the official forecast of the Department of Agriculture and Commerce yields of crops are estimated as follows, last year's figures being given in brackets:—Wheat, 3,708,000 qr. (4,209,000 qr.); barley, 4,838,000 qr. (5,687,000 qr.); rye, 4,747,000 qr. (5,084,000 qr.). (*The London Grain, Seed and Oil Reporter*, 6th September, 1918.)

South Africa.—According to the final official estimate issued from Pretoria on 15th July, the yield of maize for this season is given as 3,900,000 qr. as against 3,800,000 qr. last year. The acreage is 5 per cent. greater than last year, but owing to adverse weather conditions the yield is below normal. (*The London Grain, Seed and Oil Reporter*, 5th September, 1918.)

Live Stock in Denmark.—The numbers of live stock on the 5th February, 1918, are as follows (the numbers on the 20th February, 1917, being shown in brackets):—Horses, 510,615 (538,395); cattle, 2,141,684 (2,452,853); sheep, 247,213 (267,979); pigs, 513,012 (1,650,623). (*International Crop Report and Agricultural Statistics*, August, 1918.)

Live Stock in Sweden.—The numbers of live stock on the 1st June, 1917, are as follows (the numbers on the 1st June, 1916, being shown in brackets):—Horses, 715,101 (701,099); cattle, 3,020,381 (2,913,159); sheep, 1,344,202 (1,198,469); pigs, 1,029,967 (1,065,396). (*International Crop Report and Agricultural Statistics*, August, 1918.)

THE Crop Reporters of the Board, in reporting on agricultural conditions in England and Wales on the 1st September, state that the fine weather which prevailed through most of August was everywhere very favourable to harvest operations, and a great deal of corn has been got in under excellent conditions. The rain which occurred, mostly towards the end of the month, caused little delay or damage. In the north, the harvest is naturally not so far advanced, and there are more reports of the corn having been laid.

**Agricultural
Conditions in England
and Wales
on 1st September.**

Wheat has proved to be the best crop of the year throughout the country; the ears are reported to be well filled, and straw of a good length. With an area under this cereal of 2,556,000 acres and a yield now estimated at 6 per cent. above average, a production in England and Wales may be anticipated of 10,500,000 qr., or fully 3,300,000 qr. more than last year. Barley is about an average in the north, but rather below in most other districts: the area this year is about 1,500,000 acres, and the total production should be nearly 6,000,000 qr. Oats, like barley, are more favourably reported on than a month ago, and the yield now appears to be but little below the normal. The acreage has been largely increased; and it is hoped that the 2,779,000 acres returned under this crop in England and Wales will yield 13,500,000 qr., or 2,600,000 qr. more than last year. Peas and beans are also satisfactory, and nearly average crops, though the latter, owing to aphid, are not quite so good as a month ago.

Potatoes are still most satisfactory, and remain unusually free from disease upon the whole. The area of 634,000 acres should yield some 4,100,000 tons of potatoes, or 750,000 tons more than last year.

Turnips and swedes, though some improvement is generally noted from most parts of the country, have not recovered from the dry weather of the early summer; and fields are often very patchy. Prospects indicate accordingly a poor yield everywhere. Mangolds, although also considered to have made a little improvement, cannot be marked any higher than a month ago.

Owing to frequent and persistent washings the hop plants are now much cleaner and in better condition, and an improvement in prospects is to be noted. The quality is expected to be good, but not more than about three-quarters of a normal yield is anticipated.

All orchard fruit is, as stated last month, extremely scarce.

The rains towards the end of the month have improved the pastures, which were often getting bare, but have now in most places a sufficiency of grass. Live stock are healthy; in many districts they did not thrive particularly well during the first part of the month, but their condition is now generally satisfactory.

Labour, both skilled and temporary, is still scarce, but with the help of women, boys, soldiers, and prisoners of war, the work has generally been satisfactorily performed, though root-fields in many districts are becoming foul. In many areas much of the corn has been cut by the use of tractors instead of horse-power, and this has been of material assistance in harvesting operations.

Summarising the returns, and expressing an average crop by 100, the appearance of the crops on 1st September indicated probable yields which may be expressed by the following percentages:—Wheat, 106; barley, 99; oats, 99; beans, 99; peas, 99; potatoes, 103; turnips and swedes, 89; mangolds, 95; hops, 74.

The following local summaries give further details regarding agricultural labour in the different districts of England and Wales:—

Northumberland, Durham, Cumberland, and Westmorland.—The situation remains much the same. Temporary labour is sufficient for the need. In some cases more use is being made of motor tractors in place

Agricultural Labour in England and Wales during August.

of horses for harvesting.

Lancashire and Cheshire.—The supply of labour, both skilled and temporary, is deficient, and the shortage is being more felt owing to the unsettled weather. Help is being given by women, soldiers and German prisoners.

Yorkshire.—Skilled labour is scarce, and wages high, but generally speaking the immediate need has been met by the special arrangements made.

Shropshire and Stafford.—Skilled Labour is scarce, but temporary workers have filled the gap. Some farmers have used tractors very successfully with the binders.

Derby, Nottingham, Leicester, and Rutland.—The supply of skilled labour is very deficient, but with soldiers, women and German prisoners helping, the necessary work is being got through.

Lincoln and Norfolk.—Soldiers, women, schoolboys, and prisoners of war have met the need, and the harvest has not suffered.

Suffolk, Cambridge, and Huntingdon.—Labour is generally deficient; the fine weather during the greater part of the month considerably relieved the situation.

Bedford, Northampton, and Warwick.—The supply of labour, though occasionally short, is generally sufficient. Soldiers, women, and volunteer workers have rendered great assistance in getting in the harvest.

Buckingham, Oxford, and Berkshire.—Temporary labour has been sufficient, and harvest work has not suffered.

Worcester, Hereford, and Gloucester.—Labour is generally short but the fine weather has rendered the shortage less acute, and with the help of women, soldiers and prisoners of war, farmers have been able to get in the harvest.

Cornwall, Devon, and Somerset.—The supply of labour is short, but the good harvest weather has eased the situation. Help is being rendered by women, soldiers, and German prisoners.

Dorset, Wiltshire, and Hampshire.—The supply of labour is generally short, especially skilled hands, but the work has been performed with the aid of women, soldiers, boys and German prisoners. Hoeing of turnips and mangolds is in arrears.

Surrey, Kent, and Sussex.—Labour is short, but the fine weather has to a certain extent compensated for this, and with the help of women, soldiers, and prisoners of war, farmers have been able to get in the harvest. Skilled labour is required for thatching, and considerable areas of roots have been left unhoed for want of labour.

Essex, Hertford, and Middlesex.—There has been no serious difficulty, though the shortage still exists. In some places Government tractors have been a great help.

North Wales.—Though the supply of labour is scarce, work appears to have been kept well in hand, good assistance having been rendered by soldiers and German prisoners.

Mid. Wales.—Skilled labour is scarce, but temporary help has met the immediate need. Wages still tend to increase.

South Wales.—Skilled labour is lacking and temporary help is not always efficient, but good use has been made in some cases of mechanical help, and the fine weather has made everything easier.

THE following statement shows that according to the information in the possession of the Board on 1st September, 1918, certain diseases of animals existed in the countries specified:—

Prevalence of Animal Diseases on the Continent.	<i>Austria (on 31st July).</i> —Foot and-Mouth Disease, Glanders and Farcy, Sheep-pox, Swine Erysipelas, Swine Fever.
	<i>Denmark (month of June).</i> —Anthrax, Swine Erysipelas.
	<i>France (for the period 21st July—3rd August).</i> —Anthrax, Black-leg, Foot-and-Mouth Disease, Glanders, Rabies, Sheep-scab, Sheep-pox, Swine Erysipelas, Swine Fever.

Holland (month of July).—Anthrax, Foot-and-Mouth Disease, Foot rot, Swine Erysipelas.

Italy (for the period 29th July—4th August).—Anthrax, Black-leg, Foot-and-Mouth Disease, Glanders, Rabies, Sheep-scab, Swine Fever.

Norway (month of June).—Anthrax

Spain (month of May).—Anthrax, Black-leg, Dourine, Glanders and Farcy, Pleuro-pneumonia, Rabies, Sheep-pox, Sheep-scab, Swine Erysipelas, Swine Fever, Tuberculosis.

Sweden (month of June).—Anthrax, Swine Fever, Swine Erysipelas.

Switzerland for the period 22nd—28th July).—Anthrax, Black-leg, Foot-and-Mouth Disease, Rabies, Swine Fever.

No further returns have been received in respect of the following countries: Belgium, Bulgaria, Germany, Hungary, Montenegro, Rumania, Russia, Serbia.

THE JOURNAL OF THE BOARD OF AGRICULTURE

Vol. XXV. No. 7.

OCTOBER, 1918.

EDITORIAL NOTES.

THE series of articles on women's work on the land published in this number of the *Journal* constitutes a new departure, in that it represents the first of occasional issues which it is proposed shall deal with a given subject from various points of view by different writers. It was felt that such a departure would serve a useful purpose, since it would not only set forth the views of various authorities but would involve fairly full accounts of the subjects under discussion. The great work which is being done by women in connection with food production is deserving of the widest recognition, and the workers certainly deserve the first consideration in the publication of such a series of issues as that contemplated. Women have entered the field—in the literal sense of the word—in all branches of farm work, from motor-ploughing to thistle-cutting, and from stock-rearing to thatching and hedging.

In spite of difficulties due to a number of causes—lack of physical strength, lack of training, initial want of organisation, feminine idiosyncrasies—it may be said that on the whole the work of the women on the land has proved a conspicuous success. We commonly hear of farmers, who at first refused the aid of women to replace their men who had joined the Forces, being finally induced to give women a trial—with the result that they no longer wish to be without their women helpers. Articles in this issue show how women are helping on the land, how they are being trained, and the difficulties that are being overcome, whilst one article gives an account of successful farming by women in Devonshire, and another by Sir A. D. Hall discusses the position of women in agriculture

and the possibility of co-partnership farming. As so many farmers will now largely depend on woman labour to carry on the work of their farms, they are likely to find this series of articles of the highest interest.

* * * * *

WHEN addressing a representative meeting of farmers a few weeks ago, the Rt. Hon. R. E. Prothero, M.V.O., M.P., President

**Increased Food
Production.**

of the Board of Agriculture and Fisheries, stated that in the National Agricultural Programme for next year the first item must be the maintenance and, if that was humanly possible, the increase of our area under bread-corn, whilst the second item was the increased supply of animal food. The need for an increased home production of bread-stuffs is not the less because the harvests both in Western Europe and the United States have been good. Though the bread-stuffs are in existence, the need for diverting all available tonnage to war purposes is greater than ever. The Allies will need to draw heavily for corn on North America, and every ton that has to be brought to Europe by so much reduces the strength of the American Army in Europe. Above and beyond that, however, it will be essential for this country after the War to concentrate more than before on the home production of the necessary foods, and particularly bread-corn. In his address to farmers, referred to above, Mr. Prothero remarked that the nation, if only as an assurance against blockade, would demand from the land at home a greater production of bread-stuffs. "We cannot forecast with accuracy what the required area will be," he said, "but it will anyhow greatly exceed the arable acreage of 1918. These two national needs—one the need of utilising to the full the soil which is our greatest reserve of raw material, the other the need of ensuring against outside pressure by the home production of more bread-stuffs—are, as it seems to me, a guarantee to the farmer that he will not find his arable land a burden."

At the present time, the most important foodstuffs required are bread-corn, potatoes, milk, bacon, beef and mutton, and in preparing next year's programme farmers should bear these items continually in mind. *The policy of food production should be regarded as essentially an insurance policy*—a policy which will guard against calamity and overcome all possibility of shortage of any of the essentials. In regard to the ploughing policy, farmers, as Mr. Prothero has said, will only be asked

to plough land which is capable of growing good crops and roots, and they will only be asked to plough even this if, in the opinion of the County Executive Committee, they have sufficient labour to cultivate as well as to plough.

* * * * *

WITH regard to the increased supply of animal food the essential point to be remembered by the farmer is that he

Feeding Stuff.* himself must grow more of the feeding stuffs for his stock. It can hardly be supposed that in the near future we can rely on even the bare necessities for our stock, other than milking cows, being imported from America. In the view of Mr. Prothero, "The summer and autumn are not the difficulty, but, if imported supplies of cake and grain are cut off, what can the dairy farmer or feeder do when his grass has failed to provide meat and milk throughout the winter and spring? I believe there is no other answer to that question except this: He must do as his fathers did in the days when no imported feeding stuffs reached these shores. He must grow more of the food himself, not only roots and green fodders, but oats and beans. If the outside world cannot send him food for his stock in the winter, he must feed them himself from the produce of his arable land." What has been said points to the utmost possible use of the existing arable land and to the improved management of the grass land unsuitable for ploughing—the urgent need is to maintain or extend the area of corn and to increase the production of home-grown feeding stuffs for stock. In the words of the President, "Without more animal food we shall go badly short of meat in the late winter and early spring months of 1920. It is only by an increase of arable land that these two needs can be met."

* * * * *

IN order to make the best use of our arable land and to improve our grass the greatest possible attention should be

Manures. given to the conservation of farmyard manure and its effective employment. As indicated in the Notes on Manures at p. 860, artificial fertilisers are not obtainable in unlimited quantities, so that farmers will need to consider very carefully how they may best employ them. It cannot be too strongly emphasised that they should be ordered early, that is, *without delay*, even though they may not be required for use until spring. Farmers should there-

* See also pp. 864, 888-94 and 915.

fore estimate as nearly as possible what their requirements of fertilisers will be, *order them at once*, and on receipt take the very greatest care to ensure proper storage. Close attention should be given to the importance of lime.

* * * * *

ATTENTION is specially directed to the Circular Letter published at p. 875, dealing with the object of the Small Holding Colonies (Amendment) Act, 1918. It is

**Settlement of
Ex-Service Men on
the Land.**

generally agreed that it is highly desirable to provide facilities for the settlement of soldiers and sailors on the land at the time of demobilisation, and the hope may be expressed that the County Councils will do all in their power to this end. The letter shows what steps may be taken in order to ensure the provision of land, and points out that the Soldiers and Sailors (Gifts for Land Settlement) Act, 1916, empowers the Board, or a County Council, to accept and administer gifts for the settlement of ex-soldiers and sailors on the land. Private individuals, therefore, who are in a position to make gifts, may wish to take advantage of the Act and afford valuable aid in increasing a settled rural population.

* * * * *

THE Editor will at any time welcome from farmers and others short practical notes dealing with agriculture, horticulture and the allied industries, with a view to publication in the *Journal*. Such

**Short Notes from
Farmers.**

notes might describe processes not commonly known, methods of meeting emergencies due to the War, implements found useful locally but not widely distributed, successful cases of co-operation, good results due to exceptional farm or garden practice, high crop yields, the improvement of arable or grass-land, the reclamation of waste or derelict land, and so forth. Illustrations may prove of interest and value. While it cannot be guaranteed that all such notes will be published, they will all be carefully considered, and certain of them will be included in the *Journal*, as at present, with or without the name of the writer, as desired.

THE POSITION OF WOMEN IN AGRICULTURE.

SIR A. D. HALL, K.C.B., F.R.S.,

Permanent Secretary, Board of Agriculture and Fisheries.

Before the War.—The difficulties attending the entry of women into the business of agriculture were already very manifest before the War: the large numbers of women who have come to the assistance of the country by taking up work upon the land have, of late, only made the problem more apparent. In those earlier years at the various agricultural colleges open to women, and at the many private venture institutions, many of which were of a somewhat unsatisfactory character, increasing numbers of women were obtaining a training in agriculture, fruit growing, dairy work, and poultry-keeping. But at the end of their education they were rarely able to obtain satisfactory openings whereby to put their knowledge into practice. In far too many cases they were induced to take a small holding, a poultry-keeping business, or some still more hypothetical enterprise, and embark the little patrimony they possessed before they had any real experience of the commercial side of farming. Many of the businesses thus purchased were economically impossible; not infrequently they were plainly fraudulent—intended to exploit the sanguine expectations of women without experience, and in the vast majority of cases they of necessity ended in failure and the loss of the small capital upon which the women depended. Of course, numerous instances of success in these small businesses may be quoted, where the intelligence of the woman seized upon an opening that was not perceptible to the ordinary routine cultivator, but the failures were all too frequent.

Putting aside the few examples of women possessed of considerable capital and rural connections who embarked upon the ordinary business of farming with the same measure of success as would have attended men entering under the same conditions, in the majority of cases women were not able to attempt ordinary agriculture but took up some of the minor businesses dependent upon the land, and, as a rule, they attained their success by raising produce of the luxury type and by catering for a clientele of amateurs.

New Situation Due to the War.—The War has created a new situation. Large numbers of women have gone to work upon the regular business of cultivating the land, and have taken their share in the management of horses and stock, and in the operations of a normal farm. Though for the moment they

are only replacing the agricultural labourer and are earning nothing more than the labourer's wages, they have thereby obtained a working acquaintance with practical farming and an insight into its difficulties and necessities that they could not have reached before. Many of these women are now determined to remain upon the land and take up farming as a career. The problem is how to provide them with that career in view of the fact that the majority of them possess little or no capital, and that farming, like every other business, cannot be entered upon without the expenditure of a certain amount of capital.

The Small Holding.—The most obvious solution would seem to be a small holding that will reduce the initial outlay of capital at risk and yet will give the woman a foundation upon which she may hope to build up an adequate business. At all times, however, and in all circumstances, small holdings represent a difficult economic proposition, and one, moreover, that involves special disadvantages to women. Though the initial outlay of capital may not be large, still capital is required, and the risk of the total loss of that capital is probably greater than would be the case with a larger farming business run upon more routine lines. The chief economic disadvantage from which women suffer lies, however, in the fact that on a small holding the actual labour of the occupier contributes the larger fraction of the income, and the hours of labour required are such as tax the endurance of a man in full vigour. The occupier of a small holding has to make up by longer hours and more intense industry for the necessary physical disadvantages attached to the size of his holding. He has, for example, to do with a spade work which on a larger farm would be done with a plough, and though the result may be better, the gain is not in proportion to the outlay of personal labour. Over and above the actual labour of cultivation, the small holder has the labour of marketing which, by reason of the smallness of the lots of produce, calls for a considerable expenditure of skill, energy, and physical exertion. It is, of course, always said that co-operation will minimise the difficulties of marketing and reduce the call upon the occupier's personal exertions, but it must be remembered that the co-operative marketing of small holders' produce is, in this country, more of an ideal than a fact. The organisation is still very imperfect, it exists in but a few centres, and the majority of small holders have to depend upon their own skill and their personal exertions in order to find a satisfactory market.

Large Farms.—In considering the entry of a new class of women or, for the matter of that, of men, into agriculture, we must begin with the cardinal principle that within limits the larger the farm the sounder is the economic enterprise it presents. Whatever the style of farming adopted, whether large-scale cultivation for arable crops, stock-keeping, or intensive cultivation for fruit and flowers, there is only a certain profit per acre to be derived. Comparing like with like, the output per acre is no greater from a small holding than from a large one. It is true that if pasture is turned into spade-cultivated market gardens the production is enormously multiplied, but this intensification depends not upon the small holding, but upon the change of system. The produce per acre from a market garden of 100 or even 1,000 acres can be just as great as that from one of 5 acres. The rate of output depends, in fact, upon the system of farming adopted, and not upon the size of the holding. On the other hand, the expenses of cultivation diminish with the size of the holding. Labour-saving machinery can be introduced, organisation of effort comes into play, and many operations, such as spraying and dealing with disease, which are expensive and wasteful of time and materials when they are applied to a small area of the crop in question, can be efficiently organised when a larger area has to be dealt with.

It is often contended that the small occupier can give greater personal attention to details and so deal more successfully with crops like fruit and vegetables. This, however, is not necessarily the case, nor does it generally maintain. The organising abilities of the large cultivator generally ensure that, in practice, his fruit trees are better trained and pruned, more effectively protected from disease, and again, that his dairy stock are better cared for than is the case with the small holder engaged on a similar business. Again, on a large holding, the management expenses are reduced because they are spread over a wider area. The capital outlay on a small holding is, further, increased out of all proportion. Fencing and roads alone form a considerable charge per acre on the output of the small holding. Since the profit of farming depends fundamentally upon the gross output per acre, and on the large farm the necessary expenditure on capital, cultivation and management is less than on the small holding, the divisible surplus which may be made available for the workers must be greater.

Co-partnership Farming.—The question is whether a means can be organised whereby that surplus can be passed on to the worker, and not wholly absorbed by capital and management ;

if so, a share in a large farm worked as a single enterprise ought to produce more to the worker than would obtain from his portion of the land if he has to work it as an independent unit. So fundamental is this principle that it may be illustrated by a concrete example, taking pre-war costs and prices.

Let us consider a large farm cultivated intensively for fruit and vegetables. For each 100 acres about £2,000 capital would be required. The expenses of management may be set at £1 an acre = £100 in all. Payments to labour will amount to about £1,000, *i.e.*, a labourer per 5 acres, and the gross profit would also amount to about £1,000. Out of this gross profit £100 has to go to management and another £100 to interest on capital, leaving £800 as the net profit. If this £800 were divided amongst the labourers it would give them a further 15s. a week and raise their remuneration from 20s., their ordinary wages, to 35s. a week.

Now let us suppose the same 100 acres to be divided into holdings of 5 acres each for the 20 labourers employed upon it on the large farm. Each small holder would require about £150 capital. Then, if he or she obtained the same gross proceeds per acre, £20, the income of the small holder would only be £100—practically the same, if interest on capital is considered, as the labourers on the large farm obtained.

In order, however, to obtain the same gross proceeds per acre, the small holder would have to make up by extra labour for the advantages obtained on the large farm by the use of labour-saving machinery and by the organisation possible in large scale working, and also for the economies derived from buying and selling on a large scale. The physical strain upon the worker is consequently far greater, the risks are greater because the small holder has no reserve wherewith to meet one or two bad seasons, and the small holder's capital as well as labour is at stake in the operation.

One factor in favour of the small holder is that if he or she has a fortunate season or two and possesses special aptitudes for the work, there is a possibility of making the business grow and gradually transforming it into an undertaking large enough to pay for labour and leave the occupier to management only. It should be observed that this ambition explicitly postulates the conception that a large farm is better than a small one and is the ultimate aim of the occupier. It is clear that only a minority can progress in this fashion. For the great majority the question is whether it is preferable to earn the return that

can be obtained from the unit area of land as a labourer working under direction or as an independent farmer. If, for the considerations advised above, the average income is likely to be at least as great in one case as in the other, then a preference may be given to the large holding farmed in partnership, if only because of the diminution of the risk to the individual that is thereby involved, for it must never be forgotten that starting a small holding has a very considerable element of speculation attached to it, and that a large proportion of failures occur even amongst men picked from a community well accustomed to living upon small holdings.

Co-partnership Farming Scheme for Women.—Granted these preliminary considerations, we may proceed to consider the sort of scheme which would give the method of partnership in farming a fair trial amongst women.

In the first place, there are many reasons to suggest that the trial farm should be one mainly occupied with fruit-growing and market gardening. Not only does this type of business involve a smaller initial outlay of capital in proportion to the turnover and profits, but the manual work to be performed is on the average less physically exacting, calling for concentration of effort, endurance and skill rather than the extension of considerable physical strength at any moment. If, further, it be assumed that the scheme will first be tried amongst comparatively educated women, fruit and vegetable growing offer greater opportunities for intelligence and skill than does the work of an ordinary mixed farm.

The Land.—The scheme would propose to take an area of about 500 acres of good land suitable for intensive cultivation, preferably in an undeveloped state in order that the colony might be built up gradually and populated by degrees as more and more of the land was brought under intensive cultivation. The land must be good—it would be ruinous to handicap the scheme with unsuitable soil—and considerations of transport and proximity to markets would require just as much consideration as would be given to them by an individual capitalist embarking upon a commercial enterprise.

Management.—Given the land, the next step is the engagement of a good manager, not only skilled in cultivation, but accustomed to marketing and with a thorough knowledge of such farming from the business side. It should be a matter of indifference at the outset whether this manager should be a man or a woman. The success of the enterprise depends upon obtaining real capacity at the head.

Labour.—One may assume that there would be a certain amount of labour upon the land at the start, which labour need not be hastily dispensed with, because for some time a regularly increasing stock of labour will be required, as the intensively farmed area extends.

The women who offer themselves for work in the colony would be engaged at first only in such numbers as the year's programme of cultivation determined. The women would be taken on as labourers at a weekly wage, and for the first year, until they had proved their quality, they would be probationers with no claims to a share in the undertaking. After the first year, if they were found suitable they would be accepted as members of the colony and would thenceforward be entitled to their share in the profits. As the planting extended and the call for labour increased, further women would be taken on. In so far as they were unskilled, each of them would be put to work during their probationary year, alongside one of the more experienced women, and they would, in their turn, become "partners" in the enterprise. In the course of five or six years the place would be developed up to its maximum capacity of employment of labour and would settle down into regular running as a partnership farm.

Reserve Fund.—When the accounts were made out at the end of each year, as a first charge a proportion of the profits would have to be put aside for a reserve fund intended to provide the dividend or addition to wages in years when the profit was small or none. It must always be recognised that farming is a business in which the returns fluctuate considerably with the seasons. Hence it is necessary at the outset to build up an equalisation fund of this description.

Division of Profits.—After this provision the remainder of the profits would be divided *pro rata* between capital, management, and labour. If the capital has only been put in at ordinary rates of interest it is clearly entitled to some share in the profits in consideration that the enterprise is more speculative than an ordinary investment. The most equitable method of assessing the share which should accrue to capital would seem to be to allow the fixed interest on the capital to rank for dividend *pari passu* with the payments to management and to labour. It is, in fact, one of the necessary outgoings of the business like the payments to labour and management, and that is equally entitled to its share in the profits.

Working the System.—The working of the proposed system will be more apparent by an approximate estimate of the

finance. For convenience it will be necessary to calculate in terms of money and wages at pre-war rates. A farm of 500 acres will be required, of which we may assume that about 300 would be suited to market gardening and fruit growing, the remaining 200 being only useful for grazing or less intensive cultivation. The purchase price of such a farm may be set at £15,000, which capital would not be in any way at risk, and which would be covered by an annual rent or mortgage charge of, say, £700 a year. This charge would, of course, have to be met before the gross profits were estimated. As working capital about £8,000 would be required, reckoning that 300 of the acres would cost £20 an acre, and 200 £10 an acre, to stock. This being liquid capital employed in the business must be regarded as subject to risk of loss, and should receive interest at the rate of 6 per cent. apart from its share in further profits.

The expense of management may be set down as one manager at £300 a year and an assistant manager at £150 a year, each, of course, having a *pro rata* share in the profits.

On such a farm in full working order about 70 partners could be employed, and the wage bill at a minimum of 25s. a week would amount to about £4,500 a year.

The gross profit that might be expected from such a farm when in full working order, after paying rent, management, interest on capital, labour and all expenses, would be about £4,000 a year. Putting 20 per cent. or £800 to the reserve fund, there would remain £3,200 available for dividends. The outgoings eligible for dividends consist of

Interest on working capital (£8,000 at 6 per cent.)	£ 480
Management	450
Labour	4,500
	<hr/>
Total	<u>£5,430</u>

As £3,200 is available for distribution the profit would amount to a dividend of a little less than 60 per cent., equivalent to a rise in the manager's salary from £300 to £475 a year and in the weekly wage from 25s. to 40s.

The reserve fund would be allowed to accumulate until it was equal to one year's ordinary wage bill, after which it would not be necessary to raise it any further. It should always be invested in some security outside the business, and the interest accruing on it should be paid into the profit fund available for dividend.

In order to give the women admitted into partnership still further interest in the undertaking they should be able and,

indeed, encouraged to invest a portion of their annual dividends in the enterprise, so as gradually to pay out the capital. On the sums so invested interest as stated above at the rate of 6 per cent. would be paid, together with what further dividend accrued from the capital's share in the profits. The partners should at any time be able to withdraw this capital, which should be repurchased by the undertaking, and when any of the partners cease to work upon the farm they should, as a matter of necessity, be paid out. A partner leaving the farm, however, would have no title to share in the reserve fund even though in the early years of the working of the enterprise she had contributed by her labour to build up this reserve fund.

In the early stages of the enterprise it would be inadvisable to give the partners any voice in the management, because success or failure depends so entirely upon the direction and business capacity of the manager. Any woman joining the farm would have to come on the understanding that she was liable to dismissal if her work proved unsatisfactory. The probationary year would, however, provide a testing time for both employers and employed. As the scheme got finally established, and as the partners began to accumulate capital and have a substantial interest in the concern, it would be desirable to give them seats or even a majority upon the Board of Management. Indeed, the ultimate idea is that the partners should own the whole of the capital and be collectively responsible for the management, however much they may delegate the direction to an individual.

Mode of Life : Community System.—The next point requiring consideration is how the women working upon the farm will live. Clearly, if they are to be self-supporting upon the exiguous incomes derived as labourers (and our prime postulate is that the majority of the women possess no other source of income and must be self-supporting), some system must be devised by which their expenses will be reduced to the lowest possible extent. This can only be attained by building up some form of community which will admit of low rents and possess a common kitchen and messing arrangements in order to minimise the cost of feeding. It will be necessary in the first place, therefore, to have a community house containing a common kitchen and dining rooms, common rooms for society and recreation, and a certain number of bedrooms which can be let at rates within the means of women engaged upon the farm. In addition to the community house, cottages should be erected which should either be taken singly or jointly by the women.

A certain amount of variation should exist both in the living room and the cottage accommodation so that the residents could adjust their mode of living to their income. The woman, therefore, who possesses a small income of her own would be able to run either a house of her own or otherwise to use her independent income to secure a better style of living. Again, there will be variations in the incomes which the different women derive from the farm itself, as some of them are promoted to act as forewomen or assistant managers, and the object should be to enable this difference of income to be applicable to the mode of living of the individual, while those who are on the lowest scale of wages may still be able to be self-supporting. The purpose of the community house would thus be, not to secure a uniform institutional mode of existence, but to leave as much freedom and diversity as possible on a fundamentally economical basis.

The finance and management of the community house and the cottage arrangements must be treated as an entirely separate undertaking from the farm. It should be managed by a paid manager acting under a committee of the residents. Assuming that the farm will possess a good house which would serve as a nucleus of the community, and that about 20 further cottages will require to be erected as well as the additions to the central house, the capital required for the housing arrangements will amount to about £10,000. This capital would be only at risk to the extent of about one-quarter, since one may safely consider that the cottages would always be required by the developed farm, and that their cost could be realised if the experiment failed and the undertaking came to an end.

Married Women.—One point requires consideration—the position of married women in such a community, or of women who marry when they are workers upon the farm. In the first place I think it must be assumed that in the experimental colony men must be excluded as partners in the enterprise. The prime object of the experiment is to test to what extent women can make themselves self-supporting in agriculture, and the experiment would be jeopardised if it is so conducted as not to throw the whole of the work of every kind upon women, or if any adjustment has to be made to represent the relative working powers and earning capacities of men and women. At the same time there is nothing in the conception to prevent the employment of married women, and it should be open to any of the women partners to marry and to reside

in one of the cottages on the estate, though the husband would need to find his employment elsewhere. Adjustments of the working hours of these married women would also be possible with a corresponding adjustment of the wages they receive.

The Appeal to Women.—In discussions of the scheme considerable diversity of opinion has been manifest as to whether the idea of such a community life will appeal to women. On the one hand many people think it will, and they point out the experience of women's colleges and settlements as showing that such a society as would be afforded by the community house is congenial to the habits and wishes of a large majority of women. While they would all be earning comparatively narrow incomes they still would be able to live upon them, and would, it is expected, have sufficient leisure to be able to build up a society with reasonable amenities of its own. In this respect one of the greatest objections to the attempts of educated women to work upon the land and to live upon small holdings would be overcome. Such women find themselves extremely isolated and cut off from all society of their own kind in the country. They occupy an anomalous position and are rarely able to associate either with their fellow small holders or with the residents of the district in which they are working. In such a community as is under consideration they would be working with a number of women in the same circumstances as themselves, and the narrowness of their income would not act in the way it usually does in cutting them off from all society of their own kind.

On the other hand many people hold the idea that such a community existence would be repugnant to women. They, it is said, in the first place want an establishment of their own, and their desires would be very much better met by an independent small holding, however small, which would at least give the feeling of a personal existence capable of expansion and growth. To this one must answer with the hard fact that a small holding requires some capital, results in failure in a comparatively large proportion of cases, and is only successful at the expense of a life of drudgery. The outlook of a labourer upon such a community farm may not seem to be very tempting—an average income of, say, £2 a week—but that does represent the maximum which a single-handed worker can earn out of the soil with all the advantages of organisation and with all the profits of farming diverted to the worker. No schemes of co-operation, of assisted purchase of a holding, of loans of capital, or any other extraneous system, can increase the gross

earnings from the land, and the whole point of the enterprise is to secure that the worker gets the maximum of the earnings that can be won from the land without having to risk her own capital, existing or borrowable. Of course the return is low, but it must be insisted that it represents the best the land is capable of earning.

Doubtless, women can earn better incomes upon the land by teaching, by organising, and in certain cases by managing for other people, but these are professional occupations demanding a considerable preliminary expenditure of capital in procuring a technical training, and they do not bear upon the question of how the woman is to live by the actual business of farming if she possesses no capital of her own whereupon to start in the position of a manageress and not of a labourer. At the same time the conception that many women will have the ability to make a successful start as small or large farmers with any capital they may possess is by no means excluded. They would be very much more likely to make a success of such an enterprise after they had spent some time upon such a community farm, and it may be expected that a considerable colony of independent holders will eventually grow up round the community farm, these holders having, after getting their experience upon the farm, taken up land on their own account. Naturally a system of co-operation for purchase and marketing between the small holders and the colony could readily be organised and would tend to make the small holders' position more lucrative and more stable.

To sum up the proposed scheme. What is required is, in the first place, a farm suitable for development under intensive cultivation and preferably of about 500 acres in extent. Because of the period the experiment would require for its realisation and the development that would have to be put into the land, it is practically necessary that this farm should be purchased. For this purpose about £20,000 would be required, but as the capital value of the land would considerably appreciate and not be at risk it should not be difficult to raise this prime sum, considering the importance of the experiment from the point of view of the future position of women with regard to agriculture. A further sum of approximately £10,000 would be required for stocking and carrying on the business of the farm. This would be ordinary trading capital, and its ultimate recovery must be regarded as dependent upon the success of the enterprise. This capital is, therefore, at risk and would have to be raised from private sources, though, perhaps, a contribution

might be obtained from public funds towards expenses in the initial stages of the enterprise when the farm was getting into a self-supporting state. As, however, the capital would be put into the business, which would be conducted upon normal lines as regards management, the risk of loss of the whole or the greater part of this capital would not be great. A further £12,000 would be required for housing purposes, of which about £3,000 would be liable to loss because it would be sunk in adapting the central farm house to community purposes. The cottages on which the rest would be spent would always form a realisable asset, though all building, even of cottages, within the next few years must involve a certain ultimate loss of capital. On the whole this capital for housing purposes would have to be provided from private sources, though a State contribution may be expected towards the cost of building cottages as part of the State housing schemes which will prevail all over the country.

WOMEN IN AGRICULTURE DURING WAR-TIME.

MISS MERIEL L. TALBOT, C.B.E.,

Director, Women's Branch, Food Production Department.

EARLY in the War, when men were offering themselves in large numbers for military service, it was obvious that action must be taken to fill the gaps in the labour market at home—agriculture and other vital industries had to be maintained and a new supply of labour called in. From whence could this labour be obtained? In the shops and factories, on the trams and railways, and in the dockyards women were already beginning to do men's work, adapting themselves to the new conditions and responding to the call of the country.

The Origin of the Official Women's Organisations.—Lord Selborne, who was Minister for Agriculture in 1915, decided that for farm work also the help of women must be secured. He turned to the existing machinery of the Labour Exchanges, and invited the help of the Board of Trade to co-operate with the War Agricultural Committees already established in every county, and to set up Women Farm Labour Committees. In Berkshire, where the need had been foreseen, a Women's Committee was already established, and others quickly followed upon a similar plan. In some counties they were appointed as Sub-Committees of the War Agricultural Committees, in others on more independent lines.

Early in 1916, the writer was appointed as the first Woman Inspector of the Board, to work in close co-operation with the women inspectors of the Board of Trade; while later in the same year the Ministers concerned agreed to the transference of the Women's organisation from the Board of Trade to the Board of Agriculture.

The foundations had already been securely laid by Miss Durham and her colleagues, to whose zeal and ability in those early days lasting gratitude is due. From voluntary associations also the Department received much valuable help—women of the educated class were being enrolled as members of the Women's National Land Service Corps, a war offshoot of the Women's Farm and Garden Union, and it is those women who may be called the pioneers in the whole movement.

By careful organisation and by commonsense methods in training the women for the work for which they were best fitted, the Corps was able to offer efficient labour to the farmer, and to gain the confidence of the public. It has since been appointed as the Agent of the Board for the supply of seasonal workers, and has this year enrolled 3,000 women from the Universities and elsewhere to work in the flax-pulling camps.

The next step in the organisation of women farm labour was taken by Mr. Prothero, shortly after his appointment as President, when in January, 1917, he decided to form a Women's Branch of his Department. He appointed the first Woman Inspector as Director, and Mrs. Alfred Lyttelton as Deputy Director, and entrusted to them the somewhat novel task of organising a woman-staffed division within a Government Department. The times, however, were unusual, and the need for fresh effort was urgent—there was the continued drain upon the man-power of the country for the needs of the Army abroad, and with the heavy shipping losses there was the ever-present need for increasing the home-grown food supplies. Every effort had to be made by men and women alike to meet the situation.

When Mr. Prothero formed the Food Production Department of the Board, the Women's Branch became a part of the new Department. Its main task was greatly to increase the supply of woman farm labour, and to secure its efficiency and employment. It was only through the voluntary organisations set up in every county that this difficult task could in any way be accomplished.

As British people, we have for generations been used to seeing much of the public work of the country done by private people,

local residents, without any question of payment, but solely for the public good. Such voluntary service is one of the proudest of British traditions.

Since the War, this public spirit of men and women has shown itself in countless directions—but surely nowhere more strikingly than by the members of the voluntary Agricultural Committees now established in every county of England and Wales. The success of the Board's schemes for increasing the country's food and maintaining an adequate supply of labour and machinery depends upon the work of these Committees. They, and only they, know the local agricultural conditions, so infinitely various in our island country, and can make effective the general policy of the Government.

On the women's side of the organisation the generosity and zeal of the voluntary workers have been equally conspicuous. The members of the Women's County Committees have at much cost to themselves, both of time and money, given constant oversight to the work with all its many details and difficulties. In several counties to-day the Women's Committee has realised the importance of getting a corporate feeling among all the workers, from the Village Registrars to the County President, and has adopted a regular system of election by ballot. The county is divided into districts resembling Rural Districts. Each District Committee is elected by the Village Registrars of the area. The District Committee elects representatives for the Central Executive Committee. Thus the County Executive is not merely a body nominated by a few individuals, but it is appointed by the wish of all those concerned in the work throughout the county. It is representative in fact as well as in name.

Since the War, women have been called not only to do men's work in field and factory, but also in many unexpected places in the public service. Experience has already proved that their shortcomings—which women are the first to recognise—are the result of want of training rather than of zeal or capacity. On the War Agricultural Committees women, while giving so generously of their time and interest, are realising the responsibilities of public service, and gaining generally from the experience.

Women's Pre-War Prejudices.—The task entrusted to this body of voluntary and official workers was certainly no easy one. It must be remembered that before the War women did very little regular labour on the farms, except in Northumberland and in some of the neighbouring counties, although they

were employed in large numbers in such seasonal jobs as fruit- and hop-picking and in the potato fields. Taking the country as a whole, however, it may be said that regular farm work for women had gone out of fashion, and that in so far as any of it was still done by them it was by women of the least educated and least respected class in the village. This was largely due to the low scale of wages offered for the hard work demanded of them. Thus the idea that the work was degrading to the women themselves had first to be eradicated. This has been achieved largely by the example and hard work of many hundreds of educated women who have taken up farm work out of patriotism, and have joined either the Land Army or the Land Service Corps—or given a lead in their own village. Not only has this example induced many young women of a similar class to offer themselves, but it has brought a new spirit into the villages, where work on the land has assumed a new dignity, and is no longer regarded as unfashionable. Nothing is more valuable to the farmer than local labour of a regular and efficient kind, and the greatly increased number of village women now at work is one of the most encouraging results of our efforts.

Farmers' Objections.—Another formidable difficulty has been the prejudice of the farmer, stiffened in many cases by the opposition of his women folk. Many farmers contended that women had neither the will nor the stamina necessary for the work, and others were influenced by the very natural feeling that "the ladies" should not be asked to do the rougher work, and that they would not be of much practical use unless they did do it! Then the farmers were fearful that by employing women they would be bereft of their few remaining men. The Tribunals did their best to remove this misunderstanding, but even when not genuinely believed it served a useful purpose in stiffening the farmers' opposition to woman labour. For the women who enrolled in the newly-formed Land Army—a body to secure a mobile supply of whole-time workers—there has been a greater uncertainty of employment and less favourable conditions than in other war services. Women for the munition factories and for such corps as the W.A.A.C. and the W.R.N.S. were recruited to meet an immediate and known demand, whereas the fate of the farmers' men was to a large extent still hanging in the balance. The liberation of soldiers for agricultural work and the fact that this form of labour was liable to be withdrawn at very short notice, made the demand fluctuating and uncertain.

The women therefore came into the agricultural world under conditions about as discouraging as could be conceived. Full acknowledgment, then, should be given to the fact that their measure of success is due to their own demonstration of practical usefulness.

Organising the Women's Land Army.—While these various difficulties had to be faced, the organisation of the newly-formed Women's Land Army had to be carried through with the utmost speed. The County Committees set up their selection boards, formed training and hostel committees, finance committees, and appointed store superintendents for the distribution of the outfits. The co-operation of the Ministry of Labour and the Ministry of National Service was sought and generously given, as well as that of the Army Clothing Department—and when the arrangements were in order for the selection, allocation, training and equipping of the women, the first recruits were enrolled, in March, 1917. Since that time the Land Army has, under many difficulties, proved a steadily growing and improving source of labour, and has supplied some 16,000 women for farm and field work, irrespective of those passed directly for the Timber Supply and Forage Departments.

Training.—The training of the women has been a difficult problem. There was no time to be lost; women with some sort of skill were wanted as quickly as possible—would a four- or six-weeks' training be of any value? It is quite obvious that to be skilful at farm work and to understand the different operations, experience is necessary both for a longer time and through the succeeding seasons—but under war conditions this has not been possible. All that could be done, except in a few special cases, was to give the woman a good start—to harden her muscles, test her character and strength, and teach her something of the right use of farm implements and of the care of young stock. This the short course has done; it had perforce to be left to the farmers to do the rest. The material upon which they and we have had to work has been raw and untried. The women knew it themselves, but they came forward eager to do their best. They were full of grit and determination, and with all the limitations of technical equipment, we felt that we had much that was very promising to work upon. We were dealing with youth and with the elasticity of youth.

All those candidates who had not come up to standard in the matter of health and character were being rejected or released

as unsuitable. Those accepted had the great advantage of the twentieth-century education; they had been taught to learn and to think for themselves. In many cases, of course, bad surroundings or mechanical work had warped the powers of body and mind and a sense of responsibility, but we found that the training was usually sufficient to counteract the mischief if the material was sound at the bottom. There was a freshness and an alertness about the women which has been acknowledged by the farmers as having proved no small asset in the labour market. The farm labourer, especially in those counties where wages were low and conditions bad, had got into a groove. He had lost the sense of initiative and individual judgment. He had, as a farmer said the other day, "got lumpy." This same farmer remarked with approval that the girl he employs is "light on her feet and light with her hands and thinks for herself." "I'd a deal rather have her with cows," he said, "and she is first rate with a horse—doesn't treat him like a machine." This girl had, as I knew, been a typist in a small city office and was barely twenty years of age.

Having admitted then that we had had perforce to send out material which required a good deal of moulding by the farmers themselves before it could be called anything like the finished article, and admitting, moreover, that the new labour was apt to be somewhat lacking in stability even when it had proved its technical value, we claim (and we foresaw this) that the newly-trained woman of the summer of 1918 has a greater practical value than the woman of the summer of 1917. She has had the ground prepared for her in countless ways, and we ourselves have learnt how to equip her to more immediate practical advantage. She is, moreover, less diffident and more sure of a welcome. We claim that women's labour has proved itself a worthy substitute for male labour in a time of emergency, not only by what women have attempted, but by their actual achievements. We claim more than this; we say that in spite of the fact that a woman's working methods are different temperamentally from those of a man, she has proved (and it has come as a welcome surprise to the farmers) that she is capable in many kinds of farm work of achieving the same ends. We venture to think also that she has been a factor in widening the sympathies and the judgment of those who watched her first efforts with some scepticism and who accepted her labour with so little willingness. By "sympathies" I mean very practical consideration in the matter of a decent living wage, of the necessity for good housing,

and for some personal consideration as to health, bad weather and hours of work. The farmer will be none the worse for this loss of some of his conservatism. Here, however, I should like to say that to those far-seeing and enterprising men who have been our fellow pioneers in the venture the country owes a lasting debt. It has been a great privilege also to have had the willing help of some of the farmers in the matter of billeting and arranging of hours, and it is this awakening interest in the welfare of his employees which we feel may develop into a wider interest in agricultural conditions generally.

Successful Work of Women in Agriculture.—If we are asked to say in what branches of agricultural work women have so effectively proved their efficiency that it will never be questioned again, we should mention more particularly milking and dairy work, the care of young stock, certain kinds of field work, and the lighter branches of forestry. The work of women in such occupations as threshing, thatching, and driving motor tractors has also been remarkably successful, and the whole survey tends to prove that it is rather in the heavier and more monotonous kinds of work (which her predecessor probably accomplished with ease) in which the present-day landswoman fails. Manual work of that kind, without variety or change, tends to weary her physically and mentally and is apt to produce a reaction which has, I believe, been responsible for more misdemeanours than any other cause. It will be rather those kinds of work, therefore, which require knack, deftness of hands and personal interest and care which will make the success of the women in the future, whilst the more scientific branches will appeal to the woman of good education.

It is, of course, a matter of conjecture as to whether there will ultimately be a place for the woman farm labourer, or whether those women only will be employed who are equal to managerial capacity or of specialising in one of the scientific branches of farm work. I asked a south-country farmer the other day what he personally would do if his man came home to-morrow unwounded and asking for his old job. He considered deeply for a few moments, and then gave a very decided answer. "I should keep the girl," he said, "and, perhaps, two girls. I should set them to milking and dairying, and I should keep more cows. I would get them to work with the horses and see to the stock, and there would be plenty left for my man to do." He added, "I should feel that I had lost a rare good thing if I let the girls go, and there's many a farmer I know who will say the same thing when the time comes."

The Effect of Land Work on the Women.—There remains, then, the position from the point of view of the landswoman herself. Her success and her good service to the farmers in a time of crisis are proving themselves, but the benefit which she herself gains showed itself from the beginning of our work and will continue to show itself to the end—and, as we hope, after the War is over.

To begin with, we have dealt with thousands of young women and girls from the manufacturing towns of England and from the London slums; we have called them out of unwholesome surroundings and from occupations that were failing to develop either body or mind; we have called them from a life which demanded nothing more of the faculties than a ceaseless drain on their wits and their nerves, and have pointed them to a standard both of mental and physical efficiency. We have asked them to accomplish something more than the mere drudgery of earning their daily bread, and have given them a definite interest and purpose in life. Can the benefit or the wholesome pleasure in the new work be doubted by those who have any knowledge either of slum life or of existence in those towns, where a dead level of wage-earning respectability spells monotony and the entire absence of ideal? To those who have known the town girl of this class as she was and who watch her as she is now, the altered conditions cannot fail to be a matter of pure joy and satisfaction.

We have dealt also with the girl of country traditions who was possessed of latent inherited powers (on which the farmers set great store) and who only needed to have those powers developed, and she has proved a very valuable factor for encouragement to the raw town recruit, over and above her own efficiency. I believe that the mixing of the town and the country elements will not be the least satisfactory result of our work.

It may be that all who have not attained to more than an ordinary standard of efficiency will, in the end, go back whence they came, but it cannot be otherwise than that they will take back with them a freshness of outlook and a standard of living which will bring a very wholesome leaven into their old surroundings, though the prevailing conditions may be too strong, and, unaided, this freshness may fade away. It is not too much, therefore, to hope that some care and some measures will be taken by those who will again be responsible for them, to build upon the foundations which have been laid in the time of national stress and abnormal needs.

There is no doubt that many of the landswomen will refuse to go back to the old life, and will be made keener for

success in land work by the sound condition of competition which will return when the War is over. To those women who have proved their mettle we can promise that there will not be lacking organisation which will afford them all possible help for future enterprise.

It has been remarked by some of the critics of the scheme that the very fact that so much organisation, discipline and welfare work have been found to be a growing necessity as a background to accomplishment, is proof enough that the young women of the uneducated class are not the right material for the responsible work of agriculture. To this it may be replied that it will be those women (and, of course, there have been many such in an emergency enterprise) who have only been kept up to the mark by ceaseless supervision and discipline who will in the natural course of events be the first to drop out of the agricultural market. This must be so, when the emergency demand for women's labour ceases, and we only hope, as has been said before, that the efforts which have been spent upon them may by some means be continued. It must be, however, that for a year or so, at any rate, after the War, female labour of a quite ordinary standard will be urgently required. Demobilisation is likely to be a somewhat lengthy business, labour conditions can only adjust themselves by degrees, and the production, on a large scale, of home-grown food will still be a vital necessity to the nation.

It would be absurd to suppose that organisation with supervision and welfare efforts could be relaxed for those of the women who, for the time being, remain. It must never be forgotten that we are dealing with women who, on account of that very youth which gives them the zest and energy required for the work, need much in the way of assistance, restraint and advice. We hope that in time, when this power that shall be behind the new workers has put those of them who have benefited by it well on their way, has further trained and equipped them, and has either sent them to new ventures overseas or given them ownership or posts of responsibility in their own country, the women will be found able to organise themselves and will become an intelligent and effective power in the world of labour. The organisation already set in motion should adapt itself to the new needs, and by facilities for training, scientific or practical, carry on all that is possible of its present work.

NOTE.—**The Land Army Organisation.**—The Women's War Agricultural Committees were asked to set up Selection Com-

mittees to select the recruits for the Land Army, and Instruction and Depot Committees to organise the training and placing of the girls. Each county was requested to provide a depot to which the workers could be sent between terms of employment. A voluntary Outfit Secretary was suggested who would also superintend the sale of boots to village workers. A Welfare Committee was recommended to look after the well-being of the workers. The already existing Village Registrars and District Representatives were charged with the duties, not only of registering local labour, but of inspecting farms and billets for the Land Army.

The general method of organisation and the complexity of the work are best illustrated by an account of the necessary steps which a recruit has to take.

1. A recruit who has signed one of the forms of enrolment, which can be obtained at every Employment Exchange, receives a summons from the nearest Employment Exchange in her district to appear before a Joint Committee of the Employment Exchange and the District Selection and Allocation Committee of the W.W.A.C. at a particular hour on a certain day. Her railway ticket to the place mentioned is sent to her.

2. She is interviewed by the District Selection and Allocation Committee who decide :—

- (a) That she is sufficiently skilled to go straight to a farm as a paid worker.
- (b) That she requires six weeks' training at a centre.
- (c) That she is quite unfitted for agricultural work.

3. The Ministry of Labour arranges for a medical examination. When finally accepted, the recruit fills in a measurement form for her equipment, and is sent, if she has no previous experience, to a training centre.

4. When the recruit has had six weeks' training the County Secretary and the County Committee place her, and send her a railway voucher for her journey. The L.A.A.S. worker is told to apply to the Village Registrar or to the County Secretary if she is in any difficulty.

5. Welfare officers have recently been appointed to watch over the welfare of the L.A.A.S., inspect their billets, arrange for their recreation, etc. A handbook has just been issued, conveying useful information on many practical matters.

6. A Good Service ribbon is awarded after six months if the L.A.A.S. has given entire satisfaction, and a Distinguished Service bar for any special act of devotion connected with her work.

THE WOMEN'S LAND ARMY.

THE HON. MRS. ALFRED LYTTELTON, D.B.E.,

Deputy-Director, Women's Branch, Food Production Department.

THE Land Army appeared in the world of agriculture suddenly, and with glowing hopes of the important position which it was to fill, only to find that it was destined to fight for a place. That the worker had started out with high ideals was in accordance with our own desires, and in that spirit we had enrolled her. We knew that she would have to go through much before she even approached the position she had hoped for, but we also knew that she would prove the more successful for this very enthusiasm.

She went through her period of disillusionment. She watched her friends and neighbours of the munitions factories, and had every opportunity of comparing their wages with her own. She also saw that they filled an instant and recognised need. Then for a time the bitter cry went up: "What is the use of enrolling if the farmers do not want us?"—and some of her kind fell from the ranks in despair. The rest held on doggedly, and at last came the turn for the better.

It had been no easy matter for the farmers themselves to know what their needs would be. Soldier labour was uncertain, and the attitude of the Local Tribunals with regard to their men was perforce subject to the condition of affairs at the Front. As the summer of 1917 wore on, however, the labour shortage began to increase, and in some parts of the country the Tribunals became less lenient. By June and July there was a rapidly rising demand for skilled women, such as milkers and stock-women. The spirits of the women themselves went up with the growing demand, and enrolments increased. And so by her own grit and determination, by the power of organisation behind her, and with the kindly helping hands of many of her employers, the girl in the Land Army scrambled "over the top" and began her work in good earnest, with an enthusiasm which went far in itself to convince the farmers of her good faith.

The Land Army, however, had its troubles, even then. The new work and the new conditions were an easier matter for the women of country traditions, whose minds were accustomed to work in a groove, but for the town girl there was indeed much to which she had to adapt herself. She had been dependent for her mental nourishment upon the changing scenes of street life and on ceaseless companionship. She had

now to accustom her brain to the continued concentration of skilled work, and to school herself to complete her tasks without questioning weather or inclination. She was at first much disposed to leave uncongenial tasks as soon as she had had enough of them, but the very quickness and versatility of her brain stood her in good stead.

There were also minor troubles in the matter of billeting ; the failure at times to make the weekly wage go as far as it should ; the physical fatigue of newly-awakened muscles ; the bewildering discovery to the novice that the employers' methods were not always those of the training centre ; and then sometimes the new clothes which had been donned with so much joy of heart did not fit or wore out before their time !

Perhaps it is because she is so curious a mixture of quick perception and irresponsibility, a creature of moods and sudden unaccountable impulses, that there were at first more of these troubles than there need have been. The girl of the less educated class is quick to see what is wrong, but she is strangely reluctant to go the direct way of setting the trouble straight. Nine times out of ten she will follow the dictates of temperament instead of those of common sense, and both the farmers and ourselves have frequently had to wade through labyrinths of complications resulting from one small mishap. This state of things is disconcerting to an employer, but applies as a rule to the class of girl who is only suitable for unskilled or gang work. The better educated class of woman is reasonable enough, and frequently gives great help in the way of controlling her less steady companion.

The very ordinary and feminine troubles which seem to the novice so hard to bear probably go far towards winning the kindly chivalry and interest of those who have to grapple with her inexperience. When all is said and done the girl on the land is a creature full of grit and spirit and goodwill. Her uncertainties and her moods may all be directed into the right channel, provided that the foundation is sound. As was natural enough after generations of experience of the stolid farm labourer, the farmers were inclined at first to take their new workers too seriously. After many surprises and some trepidation they have learned, as we have learned, that with the majority of girls these troubles are only storms in the domestic teacup, and that a little humouring or firmness soon restores the working equilibrium.

It is interesting to notice that the better educated and more thoughtful amongst the farmers gain the best results

from their women workers. They know how to handle them and to make use of their very freshness, and above all to give them that interest in their work which is the first and last appeal to women. They seem to have learned as time went on that there are more ways than one of accomplishing a job. The new labour was apt to exhibit what may be termed temperamental surprises, but it did not follow that it lacked technical ability or the willingness to work.

Speaking of his training experiences the other day a farmer said that he reckoned his successes in the matter of training women as 50 per cent., and of the rest he would put less than a quarter down as direct failures. "But you have to watch your girls," he said, "the same as you would a new sheep dog. They all have their different methods of getting at things. You may get a girl who does not shape well at first, does not want to milk, pretends she's frightened of cows, and does not do much in a field, but if you are going to put that girl down as a failure then and there you are likely more wrong than she is. You may bide a bit and then try her with a horse, and maybe a plough, and you may find her the best girl ever you had." This is admirable, but we realise that the ideal training makes large demands on the time and patience of a busy man.

With all her faults and failings one cannot but have the liveliest admiration for the girl in the Land Army. Her keenness and grit, the very carelessness of life which has so often brought her into trouble, have kept her buoyant through many a task that was somewhat beyond her normal powers of accomplishment. The pride which she takes in her newly-found health and strength is a delightful thing.

We are often asked what percentage of women fail through ill health or the lack of sufficient strength for agricultural work. It is difficult to make an exact estimate, as failure frequently results from more than one cause. The latest returns to the Employment Exchange show, however, that approximately 16.1 per cent. of the women passed for agriculture fail on medical grounds. Considering the fact that a large number of our women have come from the towns, this percentage may be considered surprisingly low.

There is, indeed, no more satisfactory side to our work than the daily evidence of improved health, physique, and mental vitality of the women with whom we have to deal. The girl of country upbringing has gained a new and much-needed sense of responsibility, and of the privileges which are hers by right. The old restlessness which sent her and her kind flocking to

the towns in search of excitement may give place to a sound interest which will enable her to make life in the rural districts of England her own.

With regard to the town girl, it is impossible for anyone who has not known intimately the existence of the poorer type of the labouring classes in the towns, to realise the vivifying power of natural surroundings on stagnant minds and enervated bodies. The same good result could not have been gained, of course, without the power of organisation behind. The workers of the rougher type are literally hedged in by organisation, and by ceaseless thought for their physical and moral welfare. Apart from the question of health, it must be admitted (and this applies to nearly all classes of the women employed) that some thousands of inexperienced or semi-experienced women sent into the labour market, irresponsible to a certain point, and entirely incapable of looking after their own collective interests, would have been just so much material wasted. With the best will in the world the Labour Exchanges could not have found time to deal with the daily problems which have to be faced, and the need for welfare organisation increases with every year of the work.

The fate of the poorer class of town girl after the War gives rise to anxiety. It is impossible not to feel apprehensive on her account. The unwholesome conditions of her home life and the pitiless nerve-wracking restlessness of the streets make her shiftless and irresponsible; the dulling stagnant work and the long hours in the factory bring no interest and no development to mind or body. Even during this long war of suffering she has known better things than these, and it is for us who are responsible now, and for those who will be responsible in the future, to ensure that she does not lose her new hold on life and its possibilities of happiness. If, during the last two years, she has known small wages, she has eaten good and wholesome food. If she has known loneliness, it has been for her to see the rolling spaces and the great growing forces of Nature, which by their own virtue have brought life and health to her cramped spirit. The girl in the Land Army has deserved well of us, for she has given her services bravely and with little actual reward; she has been content at times with rough living; and, except in a few instances, she has not been among the strikers for higher wages. Undoubtedly the appeal to her patriotism has not only caused her to enlist in the Land Army, but has helped her to face and endure hard work under hard conditions. "It's not so bad as what our

boys have to put up with " is by far the most common answer made by the Land Army girl to any sympathetic inquirer ; and another comment is heard even more often—" It's lovely work—I never want to go back."

Before very long this desire of the women who love the work, to stay on the land, will have to be recognised. Careful schemes of emigration must be framed and carried through ; already a register is being kept of those now in the Land Army who have the ambition to become settlers. We, believe, too that there will be a place in England for skilled landswomen after the War. The new aim of making our country as nearly as possible self-supporting in the matter of food means, even with the great increase of mechanical help, a large demand for labour. If we can train up every year a band of young women who will become the true partners and helpmates of country men, we shall have made a great step forward in the reconstruction of rural England.

THE TRAINING OF WOMEN ON THE LAND.

MISS M. M. MACQUEEN, M.B.E.,

*Chief Educational Adviser, Women's Branch, Food Production
Department.*

Pre-War Conditions.—Education in any form of work has almost invariably the effect of raising the status of the worker as well as of improving the standard of the work. In no form of labour is this more apparent than in agriculture. A century ago woman labour in agriculture was very usual, but, as scholastic education became more general, the more intelligent workers sought other fields of employment, and the work on farms (which included dairying, poultry-keeping, etc.) drifted, by degrees, into the hands of the less well-educated women. In certain districts the woman land worker was considered as socially inferior to the domestic servant.

The first serious attempt to give any training or education to women in agricultural subjects in England or Wales was made about the year 1895, when the county councils were given the administration of the " Whisky " money for the purpose of technical instruction. Some county councils were much more favourably disposed to agriculture than others, and the opportunities in the different counties varied to a very considerable extent. For women, the principal instruction given was in dairying. The result of this, as years went by,

was most marked; the produce of the country gradually attained a higher standard, a more intelligent class of worker was attracted to the industry, and the status of the worker was very much raised. The subject has been dealt with in a comprehensive Report on Agricultural Education for Women issued by the Board of Agriculture, in 1915.*

War Conditions.—Soon after the outbreak of war, labour conditions on the land began to change, and people with foresight realised that it would be necessary for women to take their share in agriculture as well as in other industries. The chief difficulty at that stage was the fact that there were very few women indeed who had any practical experience of actual farm work, though a large number had knowledge of dairying and poultry-keeping. The first move was made by a few patriotic women, chiefly of the educated class, who realised that a need for them would arise. Their initial difficulty was to obtain such training or experience as would enable them to be of some use on the land. A certain number made arrangements to become students for short terms at such of the Agricultural Colleges and Schools as were able to accommodate them. Others arranged with individual farmers to get practice on the farms. In nearly all cases these women paid for their own training, or worked for a definite length of time without wages until competent. Others turned their attention to horticulture with the idea of releasing gardeners for the Army, and the system they adopted for training was somewhat similar to that employed by their sisters in agriculture. When trained, these women had to find work. It is interesting to note that at first employers were much more inclined to look with favour on the woman gardener than on the woman farm labourer. These pioneers deserve great credit, for they had an exceedingly difficult "furrow to plough."

The first organised attempt to train substitutes for male labour was made by the Board of Agriculture and Fisheries in 1915. An arrangement was entered into with the various Agricultural Colleges and Farm Institutes to train milkers and farm workers. The Labour Exchange Department of the Board of Trade undertook the work of finding the women and placing them in employment, the Board of Agriculture providing scholarships for the training. In the first experiment only 2 weeks' training was given, but this was soon found to be totally inadequate, and the period was extended to 4 weeks.

* See this *Journal*, December, 1915, p. 859.

This experiment served to prove that after a short period of training women could become of definite use on the land.

In the autumn of 1916 the Board of Agriculture extended the facilities for the training of women land workers by offering to Local Education Authorities grants which would cover two-thirds of any expenditure they incurred in that particular direction. In addition to these grants a number of £4 scholarships were awarded providing for a 4-weeks' course of instruction at certain recognised institutions. This provision is still available, and has been of the utmost value. It is granted under the condition that the applicant is passed by the Women's War Agricultural Committee and that she guarantees to give a stated period of service on the land after training. It has been taken advantage of by several of the voluntary organisations which have secured land workers, and by individual persons who have desired training in order to be of more use. It has, however, more directly benefited women of the farming community who, suddenly called upon to undertake unaccustomed work, owing to the withdrawal of the men, have been very glad to avail themselves of the privilege. In certain districts the influence of these scholarships has been most marked; the scholarships have demonstrated the value of some form of training, and have aroused the desire for more knowledge, which should have a very beneficial effect in the near future.

During 1915 an experiment in the same direction was made by the Women's Farm and Garden Union. A farm in Essex was lent to the Union by Lord Rayleigh, and a training centre established upon it. A woman superintendent, who had had experience of all farm processes, was appointed and made responsible for the training of the women. The period of training was fixed at 12 weeks, and the students had to take, in turn, instruction in all forms of farm work. The cost of the instruction was undertaken by the Union, but the students, in most cases, paid for their maintenance. The whole of these women found employment immediately upon completion of their training, and after a period of nearly three years are, almost without exception, still employed upon the land, usually occupying responsible positions as instructresses, forewomen, etc.

The outcome of the experiment was the formation of the Women's National Land Service Corps in 1916 under the able direction of Mrs. Roland Wilkins. The women recruited are of the educated type; the majority are trained under the auspices of the Women's Farm and Garden Union at the various

farms which have been lent to the Union by different members. When the numbers have been at any time too great for these farms to deal with, various Agricultural Colleges and Farm Institutes have offered facilities. The training has always been for a period of 6 weeks, and has definitely been given in such a way that the women become either cow-women or horse-women. The majority of the members pay for their maintenance whilst training, but a certain number of free trainings are given, the expense of such being met by subscriptions to the Corps. A report of the work of the Corps is published annually. The effects of the work of the Corps have been far-reaching, as the Women's Land Army has been enabled to obtain from amongst its members a large number of women who are employed as instructresses, group leaders, and forewomen in the Land Army.

In 1917 the Women's Land Army was formed, and the methods of training adopted are briefly as follows :—

1. Training under the bursary system.
2. Training at a practice farm.
3. Training at an organised centre.

Under the bursary system the farmer is allowed to have a recruit for three weeks without paying any wages, the Land Army in the meantime making an allowance for the maintenance of this recruit. The farmer agrees to train the woman in the work for which he requires her and afterwards to give her employment. The chief drawback to this system is that in many cases the farmer only trains for one particular process ; when the season for that work is over the woman is no longer required, and it then becomes necessary for her to have other training before she is of much use to another employer.

Under the practice farm system the farmer undertakes to train one, two or more women for a period of from 4 to 6 weeks. In return for training he has the labour of the trainees, the Land Army, meanwhile, giving maintenance to the recruits.

At the end of the training period the farmer does not employ his own trainees, who are then transferred to paid employment on other farms, but he may be supplied with fresh recruits.

The results which have been obtained from this method have been varied. The success depends upon—

- (a) Whether the farmer is able to gauge fairly correctly the amount of work which may be given to a " raw " recruit.
- (b) Whether the farmer has method and skill in imparting instruction.

- (c) Whether the farmer has sufficient time to supervise the work of his trainees.

The last point is of great importance, for in certain work (e.g., milking) it is very necessary that close supervision should be given until the trainee has reached a fair degree of efficiency.

In the third method, namely, the training centre, arrangements are made for the recruits to reside together in one central hostel, which is under the supervision of an instructress and a housekeeper. The hostels are usually established on farms where there are adequate facilities for training a large number of recruits, or in the centre of a district where there are several farms suitable for training. There are several very obvious advantages in this system. The instructress is able to give her whole attention to the work of training. Being experienced herself in farmwork, she is able to gauge the strength and suitability of the recruit for the various kinds of labour. She is able gradually to increase the amount of work given to the recruit, and can stop at once any recruit who is over-eager at the outset and attempts work in excess of her powers of endurance.

The recruits, who are chiefly town women, often find rural life very strange at the start, and settle much more happily if placed, at first, with companions of their own age. The fact also of having these women together renders it possible for "esprit de corps" to be established, and for steady determination to be encouraged as the first enthusiasm cools.

During the first six months after the formation of the Land Army the period of training was restricted to four weeks, but it became very obvious that the woman who was to be of use to the farmer must receive as much training as it was economically possible to give, and the period was, therefore, extended to six weeks. At the same time "efficiency tests" were instituted, with the objects of encouraging the recruits to make every endeavour to become competent, and of giving the organising secretaries some idea of the skill of the candidate, so that women could be suitably placed.

The extension of the period of training has had most marked results. It has been found that the last two weeks of training usually greatly improve the efficiency of the recruit as compared with the end of the first month. It gives her more confidence and she becomes much more used to country conditions.

The whole policy adopted in training is to make the recruit suitable for the class of work required, and in the majority of cases the training is definitely given in stock or horse work,

FIG. 13.—Welsh Women at Work.

FIG. 14.—Welsh Women at Work Stooking.

though there are exceptions to this rule, as in some counties the general farm labourer is most in request and a little of both types of work is included.

In addition to the foregoing it has been found necessary to supplement the training with certain special subjects, such as thatching, hedging, etc. For such training special classes are usually held in connection with the training centre, or, where the training is being given to women already in employment, at some central place where the women can meet after their working hours.

Special centres have also been arranged for the instruction of women tractor drivers. These are run on very similar lines to the ordinary training centres, the instruction being given specially in the management of the tractors, of the various implements attached to them, and in the general work of cultivation. As the demand for women drivers is increasing, it has now been decided that the tractor representative for the county shall be supplied with a certain number of recruits to be placed for work and training under skilled operators. The period of training in this section is similar to that of the ordinary Land Army, namely 4 to 6 weeks.

Another branch of work which received attention during the winter of 1917-1918 was the planting of forest trees. Short courses of instruction were given in the Forest of Dean by the Office of Woods, with the object of securing a number of forewomen capable of dealing with the gangs of women labour working at afforestation.

In addition to the training mentioned above, various local educational authorities and voluntary societies have helped in the movement, and it is interesting to note that the general conclusion arrived at is that a period of 6 weeks is the minimum length of time in which a totally inexperienced woman can hope to harden her muscles, accustom herself to climatic changes, and become sufficiently skilled to be of real use in this work.

Local Labour.—One of the greatest benefits arising from the establishment of the Land Army has undoubtedly been the encouragement of local labour, both skilled and unskilled. An ideal has been created, and there are clear indications that many of the women who comprise the present rural population are much more anxious now to have training than they were two years ago, and are availing themselves of any opportunities that arise. At the moment the subjects in which they appear most desirous of receiving training are milking, hedging, and thatching.

Horticulture. — From statistics it is possible to get an approximate idea of the increased numbers of women who are engaged in farm work, but in the case of gardening this is not so easy. It is more than probable that at present the numbers of women who are engaged in some form of gardening or other food production work is far in excess of those who are doing farm work, and that the increase in this direction during the War has been far greater. In the Land Army a certain proportion of the recruits receive a short training in gardening, and are afterwards employed by market gardeners, but are not allowed to work for private employers. The total, however, is not great, as so much of the work is seasonal, and many of the market gardeners prefer local labour which can find other occupation at slack times. The increase in the number of private women gardeners, however, is very considerable. Some of these women have had trainings, of varying periods, at one of the Horticultural Colleges or at private schools; others have started as garden labourers and gained experience through their work. Still larger numbers are either partially or wholly working their own gardens, often combining with this either goat- or rabbit-keeping, and, until food became scarce, poultry-keeping. The efforts made to obtain instruction and the success attained by many of these women, are most interesting. Gardening periodicals, text books, and leaflets have been most closely studied, lectures have been attended when available, and advice has been obtained from local gardeners.

Allotments, too, have been the means whereby many women have helped in the production of food. During the War the acreage and numbers have more than doubled, the notable increase being in parish allotments, and in many instances they are, if not entirely, at least in part worked by the woman members of the family.

The result (usually sufficient vegetables for home use, and often surplus for sale or for distribution to local hospitals) has been to stimulate the desire for more knowledge. Instruction has been eagerly sought, and, as experience has proved that there is both pecuniary and physical benefit, many of the women are determined that on no account shall the allotment be given up after the War if it can be retained.

Of all forms of land work horticulture is by far the most popular with the majority of women, and it appears to be work for which they are particularly suited. Many of them already possess a considerable knowledge of the work and are am-

bitious to have their own holdings. The two difficulties which the greater number have to face are—

- (1) Lack of sufficient capital to start on a big enough scale to make the venture profitable; and
- (2) Want of experience in commercial methods.

Up to the present, unless a woman was fortunate enough to get a position in a good market garden there has been little opportunity for her to gain experience in commercial methods except by bitter experience.

This autumn the Governors of the Swanley Horticultural College have inaugurated a course in Commercial Horticulture, the results of which will be followed with close interest.

Although in the past Education Authorities were most anxious to get into direct touch with all classes of rural workers, it was often extraordinarily difficult to reach many of those who required and desired such instruction as would help them to make the best of their resources. The formation of Women's Institutes* ought to be of the greatest advantage to rural life. With the existence of an organised body it should be possible to arrange for such instruction as may be required, and no woman in the future should feel that she does not know where to go for information on any subject in which she requires direct instruction, or assistance.

THE WOMEN OF WALES AND AGRICULTURE.

MRS. M. SILYN ROBERTS,

*Administrative Inspector, Women's Branch, Food
Production Department.*

AT the outbreak of War, it is likely that on an average there were as many, if not more, women doing agricultural work in Wales as in any part of the Kingdom. The reason for this is that Wales is a land of small holdings, which are mostly pastoral and which are run as family concerns.

Owing to the fact that there is but little co-operation in buying and selling, the farmer has to spend a considerable time away from his farm attending markets and fairs. This he can do without much loss to his farm, the women folk taking entire charge of milking and dairy work, and of the feeding of young stock.

Before the War, except in a few districts, the women rarely took part in field work as distinguished from stock work. The

* See article at p. 827.

trend of public opinion was against it. Such forms of horse-work as ploughing are in many western districts considered highly improper, if not physically impossible, for women. In the 'fifties, 'sixties, and even 'seventies of last century, it was usual for women to work out in the fields, but as the cultivated land was laid down to grass or left to revert to rough pasture, the women field workers gradually dwindled in numbers, until, when War broke out, there were very few skilled ones left to teach and help the newly-recruited village gangs, and of the few who had been out working years ago it was not everyone who had the courage to admit that she was an expert from days gone by.

The gradual rebuilding of the supply of local casual labour has been interesting. In many places the enthusiasm for "war work" brought out many women, who at once found that the size of the gang had to be limited to the number that could be taught and supervised by the few "old hands"—the experts of long ago. In one village a group volunteered to go out with scythes to cut thistles, but they discovered that at the outset they would all have to go together, for there was only one amongst them who could sharpen a scythe. And so with every change of season, the new workers have had to be taught afresh. The number of willing workers has been splendid, but the skilled supervisors have been few in number, and often very shy and timid in the presence of their own pupils.

It is noticeable that in Wales many of the smaller hill farms are run entirely by the women, for even in peace time the men folk have other work, such as quarrying and mining. During the last two years the number of women entirely responsible for carrying on their holdings has greatly increased, owing to the men having joined the Forces, or having left home to work in coal mines, on railways, docks, etc. In one small valley in Carnarvonshire there are 47 such women farmers. In Cardigan-shire, where there are many sea-faring folk, the number of women responsible for running their own small farms amounts to something like 500 for the county. In fact, around our coasts and in the hill quarrying districts, the number of small farms is remarkable. It may be that the precarious nature of mining and quarrying tends to make the women seek for something to help them carry on in time of need.

Since the outbreak of War, these little farms have proved reservoirs of labour, the members of the family being ready to help on the larger farms in the district. Many of our best Land Army recruits in North Wales have been of this type.

In several cases they have joined the Land Army not from their homes, but from the towns to which they had drifted, and where they were engaged in some other form of employment.

The farm maidservant is a very valuable class of worker who does a great deal on the farm, and the happiness of the farmhouse community, both in and out, depends very much on her. She is a skilled milker, and is entrusted with the care of pigs, poultry, and often calves.

A letter received from a Merionethshire woman, herself a skilled farm worker, tells its own tale, and shows how the War is gradually changing public opinion, even in the uplands and the isolated mountain districts of the western counties. This worker writes: "In my district no farmers keep maidservants—house-work is a secondary matter with them—dairy work and stock work take precedence. The wives and daughters are the milkers and stockmen; it is seldom you find a man milking, or feeding calves or attending to pigs.

"One great effect of the War upon our women farmers is that while before the War they were not willing, especially the young girls who had had the privilege of attending intermediate schools, to admit or to talk of their actual work, such as cleaning out the byres, etc., now they take a pride in all that they do. I was in a farm a short time ago where two Land Army girls were employed, and the son said to me 'Why should such a fuss be made of Land Army girls? My sister has always done the work they do, but she didn't like to say that she did it.' Once we get our young women to be publicly proud of their work on the land, it will be easier to persuade them to take up new methods of work.

"A girl of 20 years of age told me that she and her sister took charge of 9 milch cows, 19 calves from 10 to 15 months old, and 14 bullocks, made all their feed, etc.,—this was undertaken after the War broke out. The prejudice against women workers has been very great, but it has been overcome by the pluck, perseverance, endurance and good temper of our Land Army girls. I have known young men and women cycle miles in order to see for themselves Land Army girls at work."

A splendid lead was given in Monmouthshire by several of the large landowners. At a time when prejudice was strong they not only employed women themselves but undertook to train women for the county. Their action, undertaken when they themselves had to bear the expenditure, has borne good fruit. The number of L.A.A.S. women in Monmouthshire is higher than in any county in Wales.

The experiment tried by Lord Treowen is particularly interesting. He undertook to staff Pwllrhwyaid Farm with women, working under the direction of a man. Here the women were taught branches of farm work hitherto considered impossible for women. Ploughing, carting, every variety of field work, hedging and forestry—all this was done by girls drawn from town life and town occupations. The farmhouse, splendidly adapted for the purpose, with a bathroom added, served to teach the girls the true relations of hygiene to farm work.

In addition to this experiment, Monmouthshire owes four very successful training farms to Mrs. Williams of Llanrumney Hall, Lord Tredegar, Mr. Frederick Mills, and Colonel Curre respectively.

Undoubtedly the prejudice against women doing any useful work they can is dying down. The employment of women on tractors has largely contributed to this. Four have been employed in Breconshire, in spite of the hilly nature of the land ; four have been employed continuously in Denbighshire since April ; and seven tractor women are employed in Flintshire, and are doing very good work, having broken the record in the spring of this year.

In many parts of Montgomeryshire, Cardiganshire, Pembrokeshire and Monmouthshire numbers of farmers' daughters and others, who in peace time had a natural liking for horses, have taken up agricultural work with the farm horses, and are doing the loading, carting, harrowing, rolling, and, in some cases, ploughing, in real earnest. There are instances where women have shown a special aptitude for dealing with horses. In one South Wales county, (Breconshire) the War Agricultural Committee employ a woman as Assistant Horse Officer, and speak highly of her trustworthiness. They have now placed her in charge of the depot, which entails responsibility for the harness of 65 horses, and for the checking and giving out of stores, implements and fodder. This girl also keeps the record of the movements of the 65 horses belonging to the Committee working throughout the county. There are usually about 10 horses in the stables at the depot, and in addition to her other work, much of which is clerical, the girl, as Assistant Horse Officer, is responsible for the management of these horses. The soldiers and women whom the Committee employ at the depot take orders from her.

Townsfolk realised much earlier than the farming community the real danger of possible famine ; the result was that there

were more recruits ready to help the farmers than farmers ready to accept the eager, but rather unskilled labour proffered. This energy was largely switched on to allotment work, and the holiday resorts of Wales, no less than the mining valleys and industrial towns, became busy horticultural centres. In one or two places it was the women who were the first to ask for allotments and to make the demand that all gardens should be fully cultivated. Here, again, teaching was needed, and demonstrations were organised in many different ways. The lecturers from the University Colleges at Aberystwyth and Bangor, and from the Farm School at Madryn and similar institutions, gave lectures and demonstrations. Women's Institutes had been already started in some places, and they did much to stimulate local food production in other places where allotment work had begun. The need of some means of co-operation became evident, and this led to the formation of additional institutes and other societies. Later, as the produce began to fill the gardens, the need of some means of distribution arose, and women's markets were formed, such as those at Criccieth,* Llanfairfechan, Welshpool and Llangollen—all differing slightly in details of management to meet local needs. Llangollen, one of the more recent ventures in marketing small produce, has developed a line of its own, inasmuch as it cooks its surplus and so finds a ready sale for the remainder of its goods in the form of supper and luncheon dishes, etc.

Out of these small beginnings of new corporate rural life already some few industries are developing. Several places have begun basket-making on a small scale, some making the more decorative baskets for home use, others the less beautiful but equally useful wisket for general farm and garden use.

From the outset, and especially during the first years of War, when it was beginning to be realised that women would be asked to lend a hand in agriculture as in many other branches of national work, the County Agricultural Organisers and others, who in pre-war days had struggled to make our nation realise the importance of agriculture before it was too late, came to the rescue with ready advice to the women as to how they could best help.

In many instances, before even the Land Army was inaugurated, some of the lecturers at the colleges had encouraged women who were eager to assist the farmers, and had given them instruction in the minor processes of field work. From the very

* See p. 841.

start a spirit of broad sympathy prevailed, and women quite unaccustomed to farm work were not afraid to appeal to the colleges for information.

There has been a general increase in the demand for instruction on many subjects connected with agriculture, chiefly at first from those who were new to agricultural work ; but the demand comes also from the younger women who have always been connected with farm work.

In the autumn of 1917, advantage was taken of the fact that for the moment the Farm School at Madryn was not needed for men students, and a short course was arranged for farmers' wives and daughters. This course was as follows :—

Agricultural Course for Daughters of Small Holders and Tenant Farmers.

The course consisted of lectures and practical work. The lectures dealt with the following subjects :—

1. Use and economy of manures.
2. Care and use of implements and machinery, together with practical work.
3. Construction of building, with special reference to ventilation and drainage. Its effect on labour. Its effect on health and welfare of stock.
4. (a) Dairy work. Milk and its products, and their market values.
(b) Care, feeding and management of stock, with special reference to foodstuffs, rations, signs of health and disease. Common diseases. First aid to ailing animals.
5. Poultry, bee-keeping, gardening, with special reference to value of better strains and better seeds.
6. Labour-saving devices in the home.

Eight women attended the first course, and an immediate demand arose for a second course, which was attended by 12 women. Others wished to join, but there was no room for more, as by that time men students were in residence and structural limitations made it impossible to arrange for subsequent courses at Madryn.

Recently numbers of Merionethshire women have shown an eagerness to obtain training in general agriculture so that they may be able to meet the changes in agricultural work following on war conditions. Applications have been received, especially from the students of the courses outlined above, for information on the home making of cheeses and on other subjects. The agricultural education that Merioneth can give is negligible, in spite of the fact that its chief industry is agriculture, and more women are employed in agriculture than in any other work. Being a mountainous and sparsely-populated

pastoral county, its funds are all needed for its intermediate schools, and the amount available for agriculture is quite inadequate.

The University of Wales has always offered to women students exactly the same facilities as to men students, and in agriculture and forestry the principle holds good. A woman student of the University College, Bangor, has completed her degree in forestry, and has been engaged in important forestry work since war broke out, but unfortunately for our present needs, no woman has yet taken her degree in agriculture, though three women (also at Bangor University College) have pursued the diploma course in agriculture.

There is also a short course of 11 weeks in general agriculture held every autumn, but so far no woman has taken advantage of this, possibly through ignorance of the value of these facilities.

The dairy courses are better known—the course for students qualifying for the National Diploma in Dairying, and the short courses held at Llewenni and in the different counties. The Agricultural Instruction Committee are prepared to arrange extension lectures in agriculture and horticulture.

The University College of North Wales has a scheme of horticultural instruction which, since the outbreak of war, has been the means of turning out a most valuable batch of women gardeners. The scheme was made possible owing to the Marquis of Anglesey and Colonel The Hon. R. Stapleton-Cotton having placed their gardeners and gardens at the disposal of the College. The gardens are conducted on commercial market-garden lines, and the produce is sold. The training extends over a period of about 2 years, and includes a season's practical work in the gardens, followed by a 12-weeks' course at the University College and another season of practical work in the gardens, together with occasional lectures and demonstrations by the College and the Anglesey County staff. Pupils work under the direction of the head gardener, his foreman and assistants, and receive in return lodging and a weekly sum sufficient to cover the cost of living. Several of the students in training in the spring of this year carried off prizes at the competitive test in gardening at Rhuddlan. It is some indication of the business-like way they carried out their allotted tasks of double-digging, and pruning, that a head gardener who hitherto had stoutly refused to admit that women were any good, made application next day for two women, with the stipulation that he would like to have two of those he had seen at work.

In Monmouthshire, also, it is interesting to see the complete fusion of interests between all bodies concerned with agricultural training. The Agricultural Institute at Usk is, so to speak, the pivot around which revolves all training work. The Institute allows its expert staff to test every trained girl and every skilled girl who expresses a desire to enter for a certificate.

No greater tribute can be paid to the work accomplished by the land girls in Monmouthshire than the giving over of a derelict farm by the Men's War Agricultural Committee to the Women's Committee to be worked by the Land Army.

The Nantyerry Training Centre for women market gardeners have prepared a special 4-weeks' course to meet the immediate needs of Monmouthshire war workers in the Land Army. The Monmouthshire Agricultural Education Committee give six annual scholarships towards the cost of 44-weeks' tuition at the centre.

Last year, when the Women's War Agricultural Committees were developing the allotment side of food production, courses of lectures and demonstrations were given at several villages. The Horticultural Lecturer from the University College, Bangor, demonstrated once a fortnight on one allotment in a district, and taught the women what should be done during the following fortnight. At the next visit he would inspect the fortnight's work, and show how to go on during the next fortnight. It was impossible for the hard-pressed staff to meet all the demands, but, fortunately, in many places head gardeners and other skilled gardeners gave invaluable assistance in a similar way.

Great help also was given where one person undertook to provide early plants and cultivate early seedlings under glass for her district.

Women have been employed in most sections of forestry work, in weeding, clearing ground for planting, and in nursery work. In the early part of the War several employers in Wales took on a number of women, and it has been interesting to notice the very diverse expectations of the different employers—from the man who wishes to make it as easy as possible for a woman war-worker to put in an energetic day's work and prove that she can undertake a man's job if the Nation needs it, to the man who has his unbending rules of labour discipline and maintains that if women are "any good" they must do the full 9½ hours work at high pressure, with only one break at mid-day.

Much of this work could very well have been done in Wales by means of local labour, but for the first year or two local people looked somewhat askance at such work.

In 1915 and 1916 there were many places where labour for seed beds and nursery plots had to be imported. More or less educated women took up the work, and were joined after a while by a few local people, the numbers of the latter gradually increasing, so that there are now several instances in which the local labour is sufficient to meet the need, where originally labour had to be imported.

There is little need now to doubt the possibility of utilising woman labour successfully in most processes of forestry work. One large employer in North Wales writes :—

“ Women can do every kind of forestry work, except that I would not put them to tree-felling or heavy digging. They stand winter work quite as well as the average man. I have spoken to many young women engaged in planting during severe weather, and the general testimony has been ‘ I never felt better in my life.’ On this point of enduring winter weather it should be remembered that war-workers in forestry have not been to any extent drawn from a class exposed to out-door labour. They have been shop-attendants, dressmakers, teachers, or domestic servants from towns. If the evidence is satisfactory in their case, how much more conclusive it would be with country-bred girls brought up in farm service. There will be plenty of chances for promotion for workers who attain proficiency and make a study of sylviculture.”

This employer considers it advisable to have a female supervisor over every gang of 10 or 12, who should be sympathetic, and herself a competent worker. He was asked what he would consider good conditions for securing the best efforts of women workers, and he replied that he considered a week of 44-45 hours long enough, and that he thought,

1. Occasional breaks for rests were required.
2. Shelter places in case of heavy rain should be provided.
3. Warm clothing and water-tight boots were essential.
4. Payment by piece-work, with a minimum wage, advisable.

Employers often find it difficult to know what to do with women working in very exposed positions when the weather is unusually bad. Basket work, introduced by Colonel Sandbach, may be of interest to many. A group of Land Army girls was taught basket-making, and made a kind of wisket useful for farm work. These baskets were shown at the exhibitions held recently in North Wales, and dozens would have been sold, had there been a supply for sale.

It is interesting to compare the returns of women land workers other than Land Army women, in May last, though the figures can only be used for rough comparison. The number of women willing to work, but unplaced, indicates that, as far as Wales is concerned, the women workers have very largely been absorbed. In Wales only 122 full-time workers are notified as unplaced, as compared with 2,987 in England. As regards unemployed part-time workers, Wales has notified 577, as compared with 13,998 for England.

It is a curious coincidence that the three counties with the highest number of women workers are the three counties farthest west—Cornwall, Pembrokeshire and Carnarvonshire.

Since the War, the developments in women's agricultural work in Wales have taken the form of increased activities on the part of the native rural community, though the Land Army has been an invaluable incentive in many ways. The very existence of the Land Army—with its enthusiastic view of the national importance of land work—is a continual reminder that farm work is "war work," and, therefore, all connected with it must give of their best.

The Land Army girl, too, has undertaken to do whatever job is given her to do—no matter what the dictates of custom or fashion. She has, therefore, been the means of speeding up the process by which local women workers take up jobs hitherto done only by men.

In the sudden rush of harvest work, the Land Army has been invaluable in isolated districts and in places where the organisation of local workers has not been developed fast enough to meet the sudden increase of harvest work which this season has produced. The fact remains, however, that Wales possesses on its small farms a reservoir of labour, both for the larger farms and for the busy seasons of afforestation work.

The War has shown not only that women can take their share of this out-door work, but that they themselves are happier and healthier in consequence.

WOMEN'S INSTITUTES.

MISS GRACE HADOW,

Vice-Chairman, National Federation of Women's Institutes.

VILLAGE meetings for social intercourse and the interchange of ideas upon subjects such as poultry-keeping or jam-making would seem at first sight to be as little related to warfare as anything well could be. The connection between mending a kettle-lid with a button or turning stocking-tops into children's vests and the upheaval of a world catastrophe is not obvious, and yet to those who appreciate the full meaning and possibilities of women's institutes there is something peculiarly appropriate in the fact that they made their first appearance in England during the War. The institute movement stands for something far deeper and finer than the mere amenities of life—though these are by no means to be despised—for something of greater extent than even war economies, though these have served, and are serving, many useful purposes apart from the conservation of the food supply or the reduction of imports. It is a product of the age, a product whose roots strike far below the superficial needs of the moment, and the best guarantee of its permanency lies in its close kinship to other movements, in the fact that it moves with the great flood tide of public opinion.

All this seems grandiose when applied to so simple a matter, and would be worse than untrue, would be ridiculous, if women's institutes were, as has been sometimes unkindly suggested, no more than glorified mothers' meetings. Mothers' meetings are admirable institutions where some kindly lady gathers together her poorer neighbours and gives them good advice tempered by tea. Without doubt they often afford an opportunity for sorely needed relaxation and foster a spirit of friendliness; without doubt the advice given is often really wise and useful—but the whole thing is done for the mothers: it is an entertainment provided by one class for another. The essence of women's institutes is their apostolic democracy. Old barriers have fallen, new friendships have been born of the opportunity for common work and common understanding, and this new and noble democracy of service and of mutual help finds expression in the very homeliness of the institute ideal.

The women's institute is for all alike: rich and poor, gentle and simple, learned and unlearned—all pay the same subscription, have the same privileges and the same responsibilities.

Each member in turn acts as hostess to her fellow-members ; each puts her own experience and her own practical knowledge at the service of the rest. " I've come to every institute meeting this last year," a member was heard to remark, " and I ain't felt I've been patronised yet." That is one side of the institute movement, and to anyone at all intimately acquainted with English village life it will not seem a slight or an unimportant one. In the days that are to come, in the difficult time of reconstruction, it will be much if throughout rural England women have learned to trust each other and to work together.

There is, however, another no less far-reaching power in the movement. Country women, scattered, remote, hard-worked, up long before dawn to get breakfast for a man who must go perhaps eight or ten miles to his work, with children to get to school, and often poultry and pigs to tend in addition to housework, have little time to read the papers, and little chance of coming into contact with the world outside. City-dwellers have a thousand opportunities of picking up scraps of information—however erroneous—but the country woman knows none of these ; she is spared the jostling of the crowd, but she loses also the chance hearing of this and of that. Institute meetings provide just the opportunity and the stimulus she requires. There is nothing terrifying about them. She comes to meet a number of her neighbours once a month, or it may be oftener. They discuss the present difficulties of housekeeping : she tells them how she makes her sugar last, and someone else tells how to save fuel : there is a simple lecture on the best way to feed chickens in present circumstances, and then Miss X. plays and Mr. Y. sings, and the hostesses for the day provide a cup of tea and a bun all round, and the members go home feeling friendly and cheered, and that they have learned some practical method of war economy, or of making something useful for the children or the husband. Bit by bit other topics are introduced. Controversial subjects, religious or political, are taboo, but interest in their own homes leads naturally and inevitably to interest in questions of housing, sanitation, infant welfare, and kindred topics. The members learn to realise their responsibility towards the community in which they live, and, from an interest in their own village and their own county, come to see the connection between their affairs and those of the nation at large. It would be difficult to plan a better training for the exercise of the vote—a training entirely divorced from all party or

sectarian politics, based on the actual experience of home life and home needs, and working outwards through a sense of responsibility educated not to take but to give. Without the War it might have been difficult to induce women of all classes to meet together to give each other their most cherished household "tips," but war has made this seem natural and simple—as indeed it is—and the spirit which it implies goes far beyond the mere details of cooking and mending: it is the basis of true citizenship.

A spirit of true democracy and a sense of corporate responsibility are no small things to foster, but the women's institute movement not only encourages these more general and abstract qualities, but it has a practical value with regard to certain very definite needs of the moment and of the immediate future.

1. The Women's Institute Adds to the Attractiveness of Village Life.—Before the War low wages, long hours, isolated lives, and little amusement, were rapidly emptying the countryside of young people: boys and girls were drifting off to the cities; cottages were falling into ruin. "Back to the land" has long been a familiar cry, but it is no use telling people to go back to a place where they know by experience they will be bored: if country life is to attract it must be made attractive. The Y.M.C.A. is making much of the need of our men for village institutes after the War: the need of our women is no less, and it is useless to provide for one sex and ignore the other. If village women are given opportunities for social enjoyment, and are encouraged to take an intelligent interest in bettering the conditions in which they live, one great step will have been taken towards the revival of village life.

2. The Women's Institute Stimulates Village Industries, thus at once affording increased opportunities for earning, supplying certain definite needs, and establishing industries which may prove of great benefit to crippled men after the War.

The Northamptonshire institutes are taking up toy-making and basket-making, both of great importance at the moment. At Bingham eight members are earning 22s. a week by making "half-sieves," and the waste ends are used as fuel. In Sussex fourteen, and in Hampshire eight institutes are making soft toys, and as the result of exhibits shown at the British Industries Fair the East Sussex Toy Industry received orders to the value of over £300. So widely has this industry spread that a special Toy Industry Sub-Committee was formed in the spring of 1918, and a trading society under the Industrial and Provident Societies Act is in process of formation.

At Criccieth Women's Institute co-operative production and marketing have been established with such success that between March, 1917, and February, 1918, there was a turnover of over £2,000. In Worcestershire the institutes are co-operating with the County Market Scheme, which, within five weeks, increased its weekly turnover from £150 to £1,000. At Chelmsford a most successful co-operative Women's Institute market stall is held, while at Chobham a similar venture provides local requirements with local produce, whereas formerly most of the imported vegetables were obtained from Covent Garden.

At Haywards Heath a weekly market is held by five local institutes, which contribute fruit, honey, flowers, cheese, live chickens and rabbits, bottled fruit, jam, toys, vegetables, and needlework, and the women are very pleased with the prices they get for their produce.

Other institutes have started rabbit-breeding, goat-keeping, and pig-keeping, the co-operative purchase of feeding stuffs in these cases making for both economy and good quality.

3. The Women's Institute Encourages War Economy.—Cobbling, rug-making, and starch-making from diseased potatoes, are among some of the industries which will probably be temporary, but which are being successfully carried on now. In one district where there was a number of small fruit growers the president lent her kitchen and pans, the institute bought fruit at current prices from all who cared to bring it, a concession as to sugar was obtained from the Ministry of Food, jars were begged from the neighbourhood, and by August this year 2,700 lb. of jam had been made and sold first to institute members (who were entitled to 6 lb. a head) and then to the general public. The fruit would not have been worth collecting and sending to a distant jam factory, and but for the institute would either have been wasted or consumed raw instead of being preserved.

Another institute has an upholstery class; others have started co-operative village laundries and communal kitchens; while still others have started or revived cheese-making.

These are only some of the activities which have been fostered by the movement. The fact that it meets a genuine need is best proved by the history of its development.

Origin of Women's Institutes in the United Kingdom.—In 1913 Mrs. Alfred Watt, M.A., Secretary of the Women's Institutes Advisory Committee to the British Columbia Department of Agriculture, came to England. She spoke on Canadian Women's Institutes at different gatherings, and shortly after war broke

FIG. 15.—A Tinkering Class at a Women's Institute.

FIG. 16.—A Cobbling Class at a Women's Institute.

out issued a leaflet showing how the establishment of women's institutes in villages would help towards an increased food supply. In 1915 Mrs. Watt, who had for many years been connected with the women's institutes of British Columbia, discussed the matter with Mr. Nugent Harris, then General Secretary of the Agricultural Organisation Society, and after further investigation and reports the A.O.S., at its annual meeting on 23rd June, 1915, passed the following resolution :—

“ That this meeting is of the opinion that the Women's Institutes movement, which is filling so important a part in the rural life of Canada, could be adapted and made equally suitable to English rural conditions, and that the body to organise it in this country is the Agricultural Organisation Society, and that it be a recommendation from this meeting to the Governors of the Society that they should be responsible for the work.”

This resolution was approved by the Governors, who appointed a small sub-committee to carry out the work.

The first districts visited by Mrs. Watt were North Wales, where the first institute was formed at Llanfairpwll in September, 1915, and East Dorset, where the first English institute was formed at Wallisdown in November of the same year.

By December, 1916, 50 institutes were in existence, and the number increased steadily. By October, 1917, there were 137 institutes in England and Wales, and the importance of the work they were doing with respect to increasing and preserving the food supply had become so evident that the Board of Agriculture, with the approval of the A.O.S., offered to assist in their formation by creating a special Women's Institute Section under the Women's Branch of the Food Production Department to undertake propaganda in close co-operation with the Women's County War Agricultural Committees. Representatives of all existing institutes were summoned to a general meeting in London, and they (a) decided to accept the offer of the Board, and to transfer to them all work in connection with the formation of new institutes; and (b) elected an Executive Committee to continue and develop the work hitherto carried on by the A.O.S., of assisting and strengthening existing institutes. The Executive consisted of the Lady Denman, Assistant Director of the Women's Branch of the Food Production Department of the Board of Agriculture; representative members of various institutes; four members nominated by the A.O.S.; two members nominated by the Board of Agriculture (Women's

Branch), two by the Board of Education, and one by the National Union of Women Workers—Mrs. Watt as Chief Outside Organiser, and Mrs. Harris as Head of the W.I. Section attending *ex officio*.

So rapid was the growth of the institutes and so vigorous was the desire to co-operate and to break new ground, that it soon became advisable to strengthen the organisation by forming federations to link together the institutes in each county and to assist in the establishment of co-operative industries. At the present time (October, 1918) there are 700 Institutes in England and Wales, and 18 County Federations—including the North Wales Union.

Nor has the movement been confined to England and Wales. In the spring of 1916 Mrs. Blair of Hoprigg Mains, Gladsmuir, and Mrs. Gooch of Torcastle, Banavie (who had seen something of the working of institutes in England) independently approached the Scottish Board of Agriculture to ask whether they would give favourable consideration to the formation of women's institutes. Moreover, in April, 1917 (at the suggestion of Mrs. Blair), the Scottish Council of Agriculture passed a resolution that women's institutes on the lines of those in England should be established.

A deputation to the Secretary for Scotland was favourably received, and Mrs. Watt was invited to address public meetings organised in the north of Scotland by Mrs. Gooch, and in the south by Mrs. Blair. An Advisory Committee to the Board of Agriculture for Scotland was set up, and they appointed Miss A. Campbell as Organiser for the period of two years. By August, 1918, 35 institutes had been formed, with a membership of 1,391.

In Ireland, the work done by the United Irishwomen on similar lines is bearing excellent fruit. The aim of this association, which was started in 1910, "is to raise the standard of health and living, and to press into the service of their country all classes and all sects among women whose homes and interests lie outside the township areas. Such women have often felt that their talents are somewhat wasted and their opportunities of assisting in public work have been too few to be worth considering. The 'United Irishwomen' offers all women an opportunity to assist in the regeneration of their country at a time when the assistance of every man and woman is required as it has never been wanted before." The aim of the Women's Institutes movement is precisely the same, and the two are in close touch with each other.

When it is considered that women's institutes have come into existence at a time when everybody was already more than fully occupied with other affairs, when difficulties of transit placed almost insuperable obstacles in the way of holding meetings, and difficulties of food made a somewhat dismal solemnity of social functions, when money was so easily—and rightly—raised for war charities that it was almost impossible to raise it for anything else, and when most of the women who would naturally have been the leaders or organisers of such a movement were absent from home nursing in hospitals or driving motor ambulances in France, the rapidity of its growth and the fact of its becoming so widespread speak much both for its vitality and for its suitability. In war-time we cannot do with superfluous calls upon our energy; time becomes a thing to use, not to pass, and that a large and ever-increasing number of shrewd country-women choose to use it in this way shows that they find the institutes of practical value. Nor have they a value for women only: one sex cannot benefit without its reacting on the other, and the whole of rural life must necessarily be affected by such a movement. In the words of Sir Daniel Hall, Permanent Secretary to the Board of Agriculture and Fisheries, in a circular, dated May, 1918, addressed to the Local Education Authorities in England and Wales:—

“Of the many new enterprises in rural development which the War has stimulated, there are few, in Mr. Prothero's opinion, which are so full of promise for the future as the active association of women with agriculture and the prominent share which they have taken in the food production campaign. Women's Institutes, where established, should provide a means of preserving the new spirit, as well as of extending it in fresh directions; but it is as a potential stimulus to the education of the men and boys engaged in agriculture, as well as of the women and girls, that Mr. Prothero thinks they particularly deserve the support and sympathy of Education Authorities.”

The new spirit to which he refers is one which bids fair to set agriculture in its proper place as the true aristocrat of industry: “We may talk what we please of Lilies and Lions Rampant, and Spread Eagles in Fields d'Or or d'Argent; but if Heraldry were guided by Reason, a Plough in a Field Arable would be the most Noble and Antient Armes,” and these arms the promoters of the movement look to see borne in triumph by the land army of the future.

A WOMAN'S FARM IN DEVON.

MISS SYLVIA CALMADY HAMLYN,

Hon. County Organising Secretary for Devonshire, Women's Branch, Food Production Department.

The Farm Itself.—Forty years ago Great Bidlake Farm was well known throughout the district as a wheat-growing farm. When it no longer paid to grow wheat the Great Bidlake land, together with much more in western Devon, fell out of cultivation into pasture varying considerably in value.

For the farmers living in these upland farms that fringe the northern slopes of Dartmoor stock rearing became the end in view, and extra accommodation for store cattle was eagerly sought after right up to the time of the Corn Production Act.

Once the house of the manor farm of the Bidlakes, an old Cavalier family now extinct, was for a time used as a farmhouse. Later it became separated from the land, which was let annually as grass accommodation land. This system of grass sales so popular in Devon, and more particularly in western Devon, where the smallness of the holdings makes it imperative for the successful stock rearer and fattener to find a larger range for his stock for the summer months, usually resulted in the exhausting of pastures by as many animals as possible being grazed on them annually from May to December, with little or no return in the shape of manures.

This system has been pursued at Great Bidlake for many years, and the grass sale was always a popular fixture, and the history and possibilities of each field as pasture were thoroughly well known to every neighbouring farmer.

It was a common saying at each successive grass sale that "time was when Bidlake was a proper wheat farm," much as it might have been suggested that once wooden ploughs were used there, so much had corn growing ceased to be considered practical politics in the district.

The farm lies high in a high country—about 700 ft. above sea level, facing on its southern side the northern heights of Dartmoor and on its northern side the 30 odd miles of wind-swept country that lie between it and the Atlantic. Very high and very exposed, in a tract of country which is open to all the incoming wind from the sea, a wind which is caught by the Moor and flung back upon its track, the farm bears its full share of the Dartmoor storms. Away to the west is the range of the Cornish hills, Brown Willy and Rough Tor, and the china clay

heaps of Roche can be seen gleaming in the sunshine. The view is a wide and fine one, and the road from Land's End to London cuts the bottom of the farm land.

When the Devon Women's War Agricultural Committee, encouraged by the Women's Branch of the Board of Agriculture, approached the Devon Men's Executive (Food Production Department) with a view to obtaining an experimental farm for women's labour, one or two alternatives were suggested. It was felt, however, that Great Bidlake had several advantages, notably the compactness of the holding and the reputation for its possibilities of arable cultivation.

On 28th October, 1917, 144 acres were taken over under the Defence of the Realm Act and the whole handed over to the Devon Women's War Agricultural Committee for cultivation by woman labour.

At that time there were no buildings available, nor any tool or implement of any description upon the farm. By arrangement with the occupier of the Manor House the necessary farm and outbuildings were obtained and taken over by the Men's Executive. These comprised a good 4-stall stable and harness room, a cowshed, large for the district, with standing for at least 12 cows, a root house, two calving boxes, a big loft overhead, and a rickyard. In addition there are two rough implement sheds, "linhays," in an adjoining yard.

Water is laid on in each field, and the River "Lew" runs through the bottom marshes. The farm may be divided into approximately about 30 acres of really good pasture, 30 acres of marshland bottoms by the river, and the remainder arable land of good, bad, and indifferent quality.

Work on the Farm.—The banks were overgrown, and riddled with rabbit holes, and thistles had a firm hold in almost all the fields. The quota laid on the farm by the Western Food Production Department Executive was 45 acres, and, since time was short, a soldier ploughman was sent down on 1st November to start the ploughing of the wheatland. He proved quite unsuccessful, and in his place two local teams were engaged to plough 20 acres for wheat. This was done, and done well, with the local Huxtable one-way plough. An unskilled soldier, aged 18, helped until 30th December with the heaviest ploughing, and thereafter no male labour has been employed on the farm.

On 4th November the four girls sanctioned as the staff arrived, chosen from the Land Army girls available in Devon.

The first work undertaken was the cutting of the hedge wood most liable to interfere with the arable cultivation, no light task where the hard wood was frequently 20 ft. in height. Both axe and cross-cut saw were used, and the banks made up and layered. For the first week an axe and some hooks were the sole implements upon the farm.

It became clear that the girls would not be able to get through all the ploughing with the hand plough, and it was decided to try, despite every opposition, an American Sulky plough. The Syracuse Company's agent brought one on trial to the farm and quickly proved its suitability for woman labour. From that day the ploughing presented no difficulty, and much of the stiffest land has been ploughed to a depth of 7 in. by a public schoolgirl of 19.

Four horses were allowed for the farm—a team, an old mare, and a half-cart cob. The team would and did plough $1\frac{1}{2}$ acres a day at their best in the Syracuse riding plough. The discovery of this plough made it possible, instead of attaining with difficulty the required 45 acres of the quota, to plough 82 acres for wheat, oats, mangolds, and potatoes.

It must be borne in mind that all the land was ploughed down from grass, and was in a sour, tough condition, and particularly difficult to deal with. Three of the fields were very steep, and in fact the field put into potatoes was thought by many who saw it to be out of the question for ploughing with the Syracuse Sulky plough. This field was very sour indeed, and was full of stones and small boulders, with a furze brake in one corner: of late years it had only realised from 5s. to 10s. an acre, let from May to December. It was found necessary to follow the riding plough and not ride it in the steepest part of this field.

Crops Grown.—Two fields were put into Red Standard wheat (locally grown seed) early in November, and one into Red Joss seed sent by the Food Production Department, all without manuring. Throughout the cultivation a great deal of trouble was taken with the tilth, the fields being dragged and rolled again and again by the girls.

The rolling was first of all done by the granite roller typical of the district, weighing half a ton, and very hard to turn without disturbing the rolled surface. This was about as heavy and unwieldy an implement as could have been given to girls to use. Later the Department sent a cylinder roller and a Cambridge roller, both of which were much appreciated, and helped to change local opinion as to their worth. When

they arrived at Bridestowe Station many criticisms were made as to the wrong-headedness of a Department which could send such things into the district. Before long, however, these criticisms were retracted, and there were many who would gladly have been in possession of the rollers that proved better in working than the old "granites." At one time it seemed probable that the wheat would be a minus crop, but a dressing of sulphate of ammonia saved the situation, and a steady growth was made, resulting in a crop strong in straw and good for the district, harvested in September.

Some 32 acres were put into oats, the seed used being Black Tartarian from the corn-growing district near Yeoford, Devon, and an unnamed black oat, the seed of which was imported from New Zealand, and grown once on the high cliff-land near Wadebridge, North Cornwall. This was particularly fine seed, and made a remarkably good growth, very stiff in the straw, with a heavy grain. All the corn crops stood well, in spite of very heavy rains.

Mangolds were tilled in a steep 8-acre field, rather shallow in soil and stony, and proved to be the best crop in the district. The varieties sown were Yellow Globe and Yellow and Red Intermediate, and a compound chemical manure sold by the Western Counties Association was used.

Nine acres of potatoes were put in, in the worst and steepest field, and were twice sprayed by the girls with knapsack sprayers, since the horse sprayer sent by the Department would not work on the gradient. This very heavy job the girls performed with the greatest willingness. The potato crop was not a heavy one, but was an average for the district, being about 8 tons to the acre. The best of the pastures were dressed with basic slag in the bottoms, and superphosphate on the higher land to the amount allowed by the Men's Executive, and 20 acres were saved for hay. There was, of course, a complete absence of any farmyard manure for dressing purposes.

Care of Stock.—A special point was made of the care of the horses, since it is often argued that girls cannot well be successful in the handling of heavy cart teams.

The horses purchased were bought with a view to hard and constant work rather than for their suitability for woman labour, and were a complete success. The team consisted of a 17.1 hands gelding, 7 off, which came with the reputation of being too hot for his former master, but a fine worker, and of a typical cobby Devon cart gelding 6 off, about 15.3 hands, a slow, steady

worker, perfectly good-tempered, but not over eager. These horses have been responsible for the greater share of all the farm work. The third, an aged cart mare for the slow carting work, and the fourth, a half cart cob, 4 off, to run in the milk float and do extra horse in the binder or elsewhere, completed the quota of horses.

Since it was decided to use the farm as a training centre, an aged Food Production Department mare has been added for the pupils to practise on.

Twelve dairy cows were purchased, Shorthorns, Devons, and three Guernseys, and the milk has been sent daily to Plymouth.

Staff.—The staff of four girls sanctioned for the work consisted of a forewoman, a horsemwoman, and two for milking and general work.

The first forewoman was an educated woman who had lived in Devon at her own home previous to the War. The first horsemwoman was a public school girl of 19 who had a natural aptitude for horses, and who was responsible for the greater part of the ploughing.

These two left when it was decided to train Land Army girls on the farm, and were replaced by the original third hand as forewoman and by a girl of 18 fresh from school. This girl, the daughter of a well-known North Devon cattle dealer, had some practical experience, and quickly proved her skill with horses, both in conditioning and working them. Later she cut all the corn with an Albion self-binder without any difficulty, though both she and her horses were new to the job. The fourth member of the staff is a girl of 17½ who has done 1½ year's forestry on the Duke of Bedford's estate, and who possesses unusual physique and power of work. Both the third and fourth staff girls are of the industrial class. The present forewoman, a solicitor's daughter, had never been out of a town previous to volunteering for the Land Army for the duration of the War.

Since June ten Land Army girls have been taken for the usual six weeks' training arranged by the Women's Branch, and have been useful as extra hands for weeding and in the harvest, though probably most practical farmers would not care for a constant succession of new and quite unskilled hands, however willing.

General.—In reviewing the work from a practical standpoint it may be granted that it is a matter of no little surprise that so much work of the hardest kind could be accomplished by

unskilled girls, and it is strong proof that the will to work, and a fine standard of selfless devotion to the work as such, can go far to help food production.

The aim throughout has been to carry on the work on ordinary practical lines, and although it is too early a date to make an accurate statement, there seems no reason why the balance sheet should not prove to be quite satisfactory.

It is noteworthy that on all the newly-broken land the crops have been perfectly healthy, and free from the many pests that it was prophesied would destroy them.

The present condition of the farm has the approval of all the neighbouring farmers and of many farmer visitors, who are delightfully generous in their praise, and it seems strange now to look back upon the days, not so very far behind, when it was said that "they women would do more harm than all the weeds in the parish." Agriculturists would realise that more has been accomplished than the mere ploughing of the additional acreage if they heard farmers at the local markets telling each other that "they women have done well."

If Great Bidlake Farm should prove another milestone on the road that leads away from prejudice to a wider vision, the women who have worked bravely through storm and sunshine will not have worked in vain.

Farmer's Tribute—The best evidence possible that the Women's Land Army is proving enormously useful is offered by two facts—

**Women's Work on
the Land.**

(1) that the demand for their labour at present greatly exceeds the supply, and (2) that the farmers employing women are practically unanimous in their praise.

So large is the present demand for women for potato lifting and similar work that it has been necessary to withdraw a number of women temporarily from the training centres and to arrange for them to finish their training later on. Big gangs of women are wanted for potato lifting in all the three divisions of Lincolnshire, in Shropshire, and Cheshire. Harvesting gangs of women have been asked for in the East Riding of Yorkshire and a women's threshing scheme has been arranged for the West Riding.

Among recent testimonials to the land women may be quoted the following tributes by farmers in Kent and Buckinghamshire respectively:—

"These girls have worked excellently, have proved themselves worthy of the name of Britons, and have done credit to the Women's Land Army. I trust you will express my feelings and thanks to the girls and also make it known to their fellow workers at the earliest possible chance when there is a body met together. To make this public will give me the greatest satisfaction."

"Can you put into the right channel my sincere thanks for the great help we have received from two of your tractor army women. I thoroughly appreciate the help they gave us in cutting our corn this season and enabling us to get the same in record time and in fine condition. I am afraid some of our Bucks farmers do not realise the great sacrifices some of these girls are making in helping us . . . I am pleased to say these two girls are coming this week to plough and cultivate some 60 acres."

A Devonshire farmer also writes saying that he regrets that he did not apply earlier for women and, in future, will be pleased to recommend the Land Army girls to his fellow farmers.

A Woman Milk Inspector.—A member of the Women's Land Army has been appointed milk-weighing inspector in Wiltshire by the Farmers' Association. Her duty includes touring the farms and inspecting the weight register to see that it is kept up-to-date.

Women Thistle Cutters.—Useful work in thistle-cutting has been done this season by women. Two of them in Denbighshire have cut 254 acres, of which 51 acres were cut in 8 days.

Women Hedgers.—According to the Women's Branch of the Food Production Department demands are beginning to come in for women to undertake hedging work during the winter months, and trainings in this work for women are being arranged in various parts of the country.

Women Threshers.—The scheme for the employment of women threshers has been fairly started, and gangs of women are now employed in Kent, Essex, Warwick, Stafford, Yorkshire, Glamorgan, and other counties. The girls appear to be keen on their new job. They are housed in permanent billets and go out to their work every day. The gangs consist as a rule of four Land Army women and a forewoman; and wages average 23s. per week.

The experiment of employing women for this work was tried for the first time in the autumn of last year, when gangs were sent out to Lancashire, Leicester and Nottinghamshire, where they did good work.

That the work is of an arduous nature, and trying in many ways, is not to be denied, and only the strongest women are chosen for it. Moreover, the most careful supervision is given to the women employed on threshing. Some of the women have improvised masks of muslin or light canvas and say that they find these entirely successful as a protection from dust and smoke.

A Women's Pig Club.—Madron Women's Institute has a pig club which is a great success, although conducted under difficulties. About 60 shares have been allotted. The sty is a disused dog kennel in a plantation, and two members take it in turns to feed the pigs (one week each). They have five shares apiece, and the offal of the pigs in return for their services. Girl guides and other children collect the food without reward. They have a barrel on wheels with shafts for its conveyance. The carpenter who made this for them refused payment. The pigs are to be killed by the husband of one of the members and sold by another member's husband.

A Useful Women's Institute.—Doddington Women's Institute holds a weekly meeting for the cleaning of sphagnum moss, which is collected by members and school children. Sacks of moss and dressings are sent to the hospitals. Bottled fruit is also given to hospitals. A market-garden produce show was held lately and the exhibits sent

to the Navy. Northumberland Prisoner of War Fund has also been helped. Waste paper and wool are collected by the Institute, which has a library of 127 volumes.

Co-operative Tomato Growing.—Church Oakley Women's Institute bought tomato, celery and leek seeds and seedlings co-operatively. The vice-president, who made herself responsible for the seedlings, traced 160 fruiting plants to one sixpenny packet of tomato seeds. Three pounds of ripe tomatoes were taken in one day from a plant, and the Institute has bottled 60 lb. of tomatoes and made 4 quarts of tomato sauce.

Two Women's Markets.—Ipsdon Women's Institute opened a market stall in January. Since then £24 5s. 10d. has been taken, a creditable amount when the size of the village is considered. All sorts of garden produce, garments both old and new, and odds and ends of all descriptions find ready purchasers. Some of the members contribute the money taken for their goods to the Sisterhood Guild, which gives a kindly helping hand to women in need. Fifty-four garments had, up to recently, been made and distributed. This Institute has a live-stock club.

The Criccieth Women's Institute market, which was registered on 24th March, 1917, reports a turnover since then of upwards of £2,000. Vegetables, fruit, poultry, rabbits, and eggs are sold in the market. The local women are responsible for the whole of the management of this interesting development at the Prime Minister's village.

THE FOOD PRODUCTION PROGRAMME FOR 1919.

THE following is a Memorandum of a speech recently made by the Director-General of Food Production to Chairmen of Agricultural Executive Committees:—

I propose to devote some remarks to the more detailed policy of breaking up and improving cultivation, and to make some practical suggestions which the County Chairmen may like to have circulated to your Central and District Committees and to the Executive Officers.

The details may be of especial use to those who will make the actual surveys:—

The Surveyor should *not refrain* from scheduling land as suitable for tillage on the ground that the scheduling may involve some *risk of loss* to the occupier. The law provides for compensation being paid to the farmer who can prove that the needs of the nation have involved him in material personal loss.

During the continuance of War the most important agricultural products are—

(1) Bread corn; (2) potatoes; (3) milk.

Next in order come—

(4) Bacon; (5) beef; (6) mutton.

Because of the fine harvests both in Western Europe and in the United States the immediate outlook for the bread supply is not actually in a precarious condition, but the Allies generally will need to draw very heavily on North America, and every ton that has to be brought to England, France, and Italy, reduces the effective strength of the American Army in Europe.

The large United States maize harvest of 1917 has resulted in a production of pig meat in the United States which will supply this country with *all the bacon and ham* required for *some months* to come. On the other hand it is likely that supplies of *beef and mutton* will be *deficient* in the *spring* months. But the policy of Officers of Executive Committees must not be guided by the outlook of the moment; they are preparing for the harvests of 1919 and 1920, and, before these harvests have been gathered, the food position may have undergone important changes.

The *policy* of the Food Production Department is essentially an *insurance policy*. The task is to guard against calamity, not to provide for minor shortages which may be disagreeable but do not seriously lower the vitality of the nation. We have now got to consider seriously the harvest of 1919.

Breadstuffs.—The position for the cereal year 1918-19 is better than it was in 1917-18, as far as our own production is concerned, but it cannot be too clearly realised that the comparatively satisfactory position of the present year is due to a *combination* of great effort and *good weather* in many allied countries. *Given a bad harvest in North America* the cereal position might *become critical*.

The whole success of our present system of food supply would be endangered if there were such a shortage of breadstuffs as would make bread rationing necessary.

The prime object of the Food Production Executives must be to produce as large a quantity of bread corn within the country as possible.

Potatoes.—*Up to the limit* of the present acreage, potatoes will be required to ensure an adequate supply for ordinary use. If the acreage is increased, or if there is an over-average crop, a considerable quantity can be absorbed in bread-making. Potatoes produce nearly twice as much food per acre as cereals; but the labour bill is heavy, and the risk from disease considerable: on the whole, therefore, an increase in the present acreage is less desirable than an increase in cereals, and Committees *should not press for potatoes in place of corn*, except under conditions that distinctly favour potato growing.

Milk.—Efforts are necessary to maintain the present production of milk ; but in dealing with the land of dairy farmers, Officers of Committees should remember that winter milk is of much greater value to the nation than summer milk. If a dairy farmer produces little or no milk during winter, his produce is of less importance than bread corn from the standpoint of security.

Pork and Bacon.—For the present, ample supplies of bacon are being obtained from America, and it appears likely that the American export will continue, but as a deficiency in pork and bacon would be worse than a deficiency in beef and mutton, since fat meat is more needed than lean meat, it would be unwise to reduce our present very limited production, and Executive Committees should endeavour to secure an increase in pig-keeping to the utmost limit permitted by the food available, especially on farms where potatoes are grown.

Beef and Mutton.—The stocks of animals suitable for slaughter fell very low last spring, and though an improvement has taken place, it is likely that the supply of beef and mutton for civilian use will be further restricted. It would, however, appear probable that, with reasonably good management, the present number of cattle could be maintained, and a supply of meat sufficient for essential civilian needs could be produced for some years. As meat is a food always in keen demand when money is plentiful, the supply will not meet the demand ; but it must be remembered that the production of beef and mutton requires much more land than the production of breadstuffs.

In scheduling grass land for corn growing there is no statement that the surveyor will come up against oftener next season than that it is unwise to destroy grass when meat is scarce in order to grow grain of which there is plenty. The answer is that late in the cereal year the country seldom has more than 10-15 weeks' stock of grain, and that no one can foretell what quantity we may be able to secure in future, while as regards meat we have within the country stocks of cattle and sheep which can in emergency provide sufficient rations for the population for two or three years at least.

Grass of average quality also produces much less *meat* than does the same area of average plough land.

It is, of course, most desirable from the nation's as well as from the farmer's standpoint that the *stocks of cattle should be maintained*. We must utilise to the full the very large areas of grass land that will in any case remain even after full provision

has been made for the dairy herd and for horses ; we must have animals that can make profitable use of straw, and we must provide manure for arable land.

The *shortage of feeding stuffs* for cattle will give rise to difficulties in scheduling grass land, and any grass on which a *bullock will fatten* will have a special value. Fine feeding *pastures* on which cattle may be *fattened without oilcakes* should not be broken up.

On the other hand, after the best pastures are excluded, there will remain grass of good quality, which, with the aid of feeding stuffs (now unprocurable), might fatten cattle ; and without feeding stuffs would make " fresh stores " ; and there is *no land likely* to be of more value for tillage purposes than this class. As in the case of dairy cows, it is winter not summer " keep " that is most necessary. There is an abundance of grass suitable for making good " stores " ; the practical difficulty will be to maintain the condition of forward stores on the winter foods now available. Scarcity of meat will arise not at the end of the grass season, but between February and May, and the surveyor should, therefore, freely *schedule grass which does not reach* the standard of a *fattening pasture*.

The Land and Crops of England and Wales : Land Available.—There are about 27,000,000 acres of land under crops and grass in England and Wales, in addition to about 4,000,000 acres of mountain and heath used for grazing. Of the cultivated area 12,400,000 acres are under arable cultivation and 14,600,000 under permanent grass. Including temporary grass, clovers, sainfoin, and lucerne, about 16,724,000 acres are available for grazing, or for hay, and *only 10,264,000*, or one-third, are tilled for grain, potatoes, and other crops.

In the present year we have less than 57 per cent. of the cultivated land under white straw crops, while 22 per cent. is still under green crops and fallow and 17 per cent. still under temporary grasses and clovers.

In the words of the President, " in issuing orders for enforcing good husbandry, the object should be to bring up the standard of farming towards the level of the best farming in the district. It is good husbandry to take a succession of corn crops provided that the land is kept clean and properly manured, so as to maintain its fertility and prevent exhaustion. Provided these precautions are taken the Committee should not prevent a farmer from taking a succession of corn crops."

Detailed Suggestions for Surveyors who Select Grass for Breaking Up.—Surveyors should be provided with 6-inch Ordnance Survey

maps on which the areas of fields have been marked. In many counties these maps have already been prepared in co-operation with the Land Valuation Department.

The surveyor, who is responsible for classifying grass land and for making a record of the circumstances and conditions of each farm, should be accompanied by one or two representative farmers from the district.

Before the grass land of a farm is inspected it will be desirable that particulars of the area of grass and arable land, the stock kept, and the general system of farming adopted, should be obtained.

The surveyor should next decide as to the area of grass which, for one of the following reasons, should *not* be ploughed up.

(a) A moderate area of grass land should be reserved for working-horses, for partial feeding of milk cows, and for the young stock required to maintain the working stud and the dairy herd.

(b) Rich grassland which may be expected to fatten the equivalent of one bullock per acre in an ordinary season, without feeding stuffs.

(c) Low-lying land subject to flooding, and natural water meadows.

(d) High-lying and exposed land. For the purpose of adding to the grain crop of the country, land above 600 feet in the north or 800 feet in the south, will generally be of little value. In a good season satisfactory crops may be secured above these levels, but, while much land at lower levels is available, it is undesirable to spend labour on soil from which returns are uncertain. An exception may be made in the case of high-lying stock-farms, where, because of the shortage of feeding stuffs, great difficulty is now experienced in carrying stock through the winter. Such farms should, so far as possible, be self-supporting, and the tillage of some acres for providing oats, straw, and roots will often prove to be desirable.

(e) Very heavy clay soils of exceptionally poor quality unlikely to pay for tillage under present conditions. Land of this description which would, in the surveyor's opinion, be improved by the use of basic slag should be specially reported on.

(f) Very light hungry land. Land of this description should only be broken up when there is an abundance of natural manure, either ordinary farmyard or stable manure, as in the neighbourhood of camps.

The best soils for tillage are medium to strong loams, and not too heavy clays, and, where they occur at a suitable elevation, *they should always be scheduled in the first class* if there is any possibility of getting them properly cultivated.

In regard to clay soil, breaking up should not be called for if the land is low-lying and cannot be drained. On the other hand clay, if only moderately heavy, which is already, or could be, mole drained, should not be excluded from breaking up, especially when it has formerly been used for corn growing.

Clay which could be surface drained, or where crops can be planted in very narrow "lands" or "stretches," may be suitable for corn growing, and this land should be considered, especially when it has been known to grow good crops in the past. Land that must be drained by pipes or tiles should not, owing to the scarcity of these, be broken up during the War.

Light loams and fertile sandy soils are already usually under the plough. Where in grass they should certainly be broken up, unless strong grounds for continuing them in grass can be given.

The condition of ditches should receive careful attention. Much of the existing grass land is injured by neglect of surface drainage. Sometimes the fault is not the farmer's, as the arterial drainage may be defective; but in very many cases the occupier of the land is to blame. Sometimes he is responsible for injury to a neighbour's land as well as to his own. In all such cases occupiers should be ordered to clean out their ditches.

Where a surveyor finds grassland neglected, he would be justified in scheduling it for tillage in circumstances under which, if better managed, it might be allowed to remain, *e.g.*, many meadows are infested with yellow rattle, a weed that is largely due to neglect, and produce much less than their normal yield of hay. Such meadows, if the land is dry and suitable for ploughing, should be scheduled for tillage.

Critics of the plough policy have constantly taken as their motto during the past year—"Till the existing arable land better." No exception can be taken to the advice, but though there is much bad tillage, there is far more bad grass farming than bad arable farming to be seen in the country. In scheduling grassland for breaking up, the surveyor will often be able to indicate how, by better management, the grassland which is left could carry more stock.

THE CROPPING OF GRASS LAND BROKEN UP FOR 1918 HARVEST.

THE need for rendering ourselves as nearly as possible self-supporting in regard to essential foodstuffs is still vital. It is urgently necessary, therefore, that farmers in making their arrangements for the harvest of 1919 should aim at securing the greatest possible production of corn.

The practice of taking two corn crops in succession was well established before the War, *e.g.*, barley after wheat in a five-course rotation, and oats, or barley, after oats in a six or seven-course rotation where the land lies two or three years in grass. In the case of old grass converted to arable, the taking of a second, or even a third, corn crop in succession is based on at least equally sound principles. Such land is usually rich in potential plant food. As regards the best pastures which have been closely grazed, the plant food as a rule is readily available, consisting of black, formless humus, the result of the decay of plant residues (root and leaf) enriched by nitrogen accumulated from the air by the clovers, and is usually amply sufficient for the needs of two corn crops in succession.

In the case of the poorer grass land where clovers are absent or scarce, and which have been repeatedly mown or imperfectly grazed, there is often a distinct layer of undecayed fibrous material overlying the soil below. Before this matted substance can be converted into plant food, it must be thoroughly broken up and exposed to the influence of the weather. The release of soluble plant food is gradual and may extend over several years. Moreover, the amount immediately available may be so low as to necessitate the addition of artificial or other manures before successful crops can be grown. Where grass land has been broken late in the season, the supply of available plant food may, indeed, be greater in the second than in the first year.

The presence of decaying plant residues in the soil facilitates cultivation and the formation of a suitable tilth, and, in general, so long as this is not entirely exhausted, satisfactory crops can be grown by the help of artificial manures only. The point of exhaustion is postponed by the ploughing in of the stubbles, and, in some cases, *e.g.*, the chalky Boulder Clay of East Anglia, these seem to provide all the organic matter that is required for a series of corn crops in succession. The presence of chalk

assists in the formation of a suitable seed-bed and tends, generally, to establish conditions favourable for healthy plant growth.

Importance of Lime.—Exposure to the elements and the presence of lime are important factors in rendering all soils productive: they are especially potent in the case of soils that have for long been buried under turf, and have, in consequence, become sour and inert. For certain crops, *e.g.*, wheat, barley, beans and clover, lime is often an essential preliminary to success on land that has long remained uncultivated.

Drainage.—The breaking of some of the heavier classes of grass land has revealed the need for drainage. It is impossible for much pipe draining to be undertaken during the War, but mole drainage, where it is practicable, will be found a useful substitute. Failing this, the best plan before sowing is to plough the land in narrow "stretches" along the line of natural fall so as to encourage sub-surface drainage.

Choice of Crops.—1. **For Autumn Sowing.**—The most useful crop at the present time is *Wheat*, and where wheat has been successfully grown as a first crop it might well be sown again. *Winter Oats* might be grown where conditions are not particularly well suited to wheat, and for the lightest soils *Rye* might be selected. Where, however, the first corn crop has suffered from attacks of wireworms it would be safest to follow with *Beans* (or *Peas* in spring). Wherever possible an autumn-sown crop is to be preferred, as fuller use is thus made of the store of plant food in the soil. In a wet winter there may be considerable loss from "leaching" if recently broken grass land remains uncropped.

Weedy Stubbles.—A repeated corn crop obviously demands a reasonably clean tilth. Some of the worst weeds of arable land—*e.g.*, couch—are, however, usually absent from newly-broken old turf, and in the main such weeds as are present can be fairly easily dealt with. Broad-sharing or cultivating should precede ploughing where the stubbles are foul; but if on account of inclement weather, shortage of labour or other cause this cannot be done, the less weedy stubbles may be ploughed deep with skim-coulter attachment, well consolidated by harrowing, rolling and pressing, and afterwards sown with winter corn or beans. The foulest land should be similarly ploughed and left till spring, when beans, potatoes or roots may be taken as cleaning crops. Autumn-sown *Vetches*, or *Vetches and Oats mixed*, make a good smother crop and afford an opportunity for a half fallow after removal in June or July.

2. For Spring Sowing.—Of the cereals, *Oats* are the most suitable crop in the North and *Barley* in the South. Where, however, oats can be sown in the South before the middle of March, preferably by the end of February, they may be quite as successful as barley, but experience has shown that late-sown oats are very susceptible to damage by frit fly ("bottling"). Oats, further, seem to be more affected by wireworm than barley, and where wireworm has been prevalent the safer plan would be to sow barley or some of the older, hardier, and better stooling varieties of oats—e.g., Sandy, Blainlie or Golden Rain. Leather Jackets, which are often responsible for much damage to oats in the first year after breaking, are rarely troublesome a second year on the same land, as the eggs of the insect which produce the maggot are laid, as a rule, in grass.

For soils in good condition and situated in the earlier districts *Spring Wheat* may be confidently recommended. Another crop suitable for spring sowing, and in respect of which there is practically no evidence of damage by wireworms, is *Linsced*. This crop may be grown either for its seed, which is useful for feeding purposes, or for flax. It should be noted, however, that the variety best suited to seed^e production is practically valueless for fibre.

Potatoes.—The general suitability of *Potatoes* for new broken ground is well known. Even the heavier soils work lightly and produce good crops so long as the supply of humus lasts. Furthermore, for cleaning purposes the potato crop has probably no equal; it may, therefore, be grown with advantage on land considered too foul for autumn or spring corn. Even on some of the heavier soils under rotation, potatoes might sometimes be taken instead of a bare fallow; even if a full crop is not produced, potatoes with all the opportunities they afford for cleaning and aëration are likely to be more profitable to the farmer and better for the nation than a bare fallow. *Mangolds* also, especially when grown on the ridge, are admirably adapted for cleaning the land, and the same applies to *Spring Beans*, provided they are grown in rows sufficiently wide apart to permit of adequate inter-cultivation. *Peas* are a very safe crop in the circumstances under review, but should not be attempted on foul land.

With a view to maintaining the supply of organic matter in the soil, keeping down weeds, and providing useful autumn grazing for sheep, it might be advisable in some cases to sow along with the corn crop 2 to 3 lb. of red clover and 8 to 10 lb. of Italian rye-grass. Such catch-cropping will materially

help to meet a reduction in the area under food for stock consequent upon the increased cultivation of corn. In a case reported to the Board, 6 lb. of trefoil were sown along with corn on part of a field in 1917. The whole field was again cropped with corn in 1918, and the benefit resulting from the ploughing in of the trefoil was strikingly evident.*

Manures.—Only the poorest soils should require any autumn manurial dressing, and as a rule this should be limited to about 2 cwt. of superphosphate per acre. Basic slag, the supplies of which are relatively short, should be reserved for the heavier clay soils deficient in both phosphates and lime, and in no case should the application exceed 4 cwt. per acre. If necessary the phosphate dressing may be supplemented in the case of cereals with a dressing of sulphate of ammonia at the rate of 1 to 1½ cwt. per acre applied in the spring, or partly in autumn and partly in spring. For spring-sown corn about 2 cwt. superphosphate per acre should be given as a rule, supplemented, if necessary, by about 1 cwt. sulphate of ammonia.

For mangolds and potatoes, sulphate of ammonia and superphosphate at the rate of 1 to 2 cwt. of the former and 2 to 4 cwt. of the latter per acre, will, as a rule, be sufficient.

(This article is also issued as Food Production Leaflet No. 54. Copies may be obtained free on application to the Secretary, Board of Agriculture and Fisheries, 3, St. James's Square, London, S.W. 1. Letters of application so addressed need not be stamped.)

EAR COCKLES IN WHEAT.

W. SOMERVILLE, M.A., D.Sc.,

Sibthorpian Professor of Rural Economy in the University of Oxford.

TOWARDS harvest it will sometimes be observed that the place of certain grains in the ears of wheat is occupied by black or dark brown bodies very much the size and shape of a grain of wheat. These are produced by a minute eelworm known as *Tylenchus scandens*, or *T. tritici* (formerly called *Vibrio tritici*) which works up from the soil and invades the ear, displacing a larger or smaller proportion of the grains. The popular name of these dark-coloured bodies is ear cockles, purples, or pepper-corns, the first name being given to them on account of their resemblance to the seeds of corn cockle. If one of these cockles is immersed for a day in a little water, and is then

* See also p. 864, Green Manuring.

teased out and placed under the microscope, it will be found to be full of tiny, wriggling eelworms.

This trouble is probably fairly widely distributed, and is believed to be most serious in the south and south-west of England. It would be well for farmers to examine grain which they propose to use for seed, and if any cockles are detected they should be removed by careful screening, or, better still, the grain should not be used for seed.

In the autumn of 1917 Mr. F. O. Solomon, of the Dauntsey Agricultural School, West Lavington, Wilts, forwarded a number of affected ears of nursery wheat, and with these it was decided to carry out some pot experiments. These trials were conducted in duplicate in 6-in. pots holding about 5 lb. of soil each. In the following statement the aggregates of the duplicate pots are given. When 20 grains of the nursery wheat were sown per pot (No. 2) along with 20 cockles it was found that 13 ears out of a total number of 55 were more or less affected by cockles. (See Table.) The actual number of cockles found was 105, or an average of about two per ear. In two other pots (No. 1) the same number of grains of the same wheat were sown, but from these the cockles had been picked out, and in no case were any cockled ears found in the crop. It is thus evident that if the cockles are removed from a sample of seed wheat there is no risk of the subsequent crops being affected, but it is difficult to be sure that all the cockles are separated by any process of winnowing or screening, and it is, therefore, safest to reject for seed purposes wheat that has been contaminated. The reduction in yield due to the infection of the cockles was very marked, the crop being little more than half as heavy where infected seed was used as where the cockles had been removed.

The effect of steeping the cockles for 24 hours in a 1 per cent. solution of copper sulphate had no effect on the eelworms (No. 3).

Another variety of wheat, namely Dutch White, from a sound crop, was sown in other pots. When cockles were mixed with the seed, infection was easily obtained, with a consequent reduction in the yield (compare Pots 4 and 5). In this series of pots, steeping in copper sulphate seems to have had some small effect in reducing the number of cockled ears and the number of cockles, but for practical purposes the result is negligible (Pot 6). In duplicate pots, instead of sowing 20 cockles per pot only one cockle was deposited in the centre of each pot (No. 7), and although there were not so many ears

attacked, nor so many cockles produced, as where 20 cockles had been employed, infestation was sufficiently pronounced to indicate the damage that may be done to a field, even if the number of cockles in the seed grain is a comparatively small one.

It was found that the eelworms liberated from the single cockle deposited in the centre of a pot had considerable power of moving through the soil, as was evident from the fact that

EAR COCKLES IN WHEAT (*Tylenchus scandens*).—Left: An ear of wheat showing 5 cockles. Right (above): Six eelworms. Right (below): Four cockles, one in section showing the dark covering and paler centre.

the outside plants in the pots were almost as much attacked as the plants growing in the centre and, therefore, in the immediate neighbourhood of the deposited cockle.

At the present time, when one wheat crop often immediately succeeds another, one requires to be specially careful in regard to ear cockles. When a crop is infested, a certain number of cockles fall on the ground in the process of harvesting, and, in such a case, the following wheat crop is sure to be attacked.

The illustration shows an ear of wheat with cockles amongst the chaff scales, and also four cockles removed from the ear.

the lower right-hand one being shown in section. Six of the eelworms in characteristic attitude are also illustrated.

THE difficulties of the meat situation in this country, in respect of both rations and prices, are small in comparison with those with which enemy nations have to contend. A comparison of prices at the present moment is instructive.

Price of Beef during the War in other Countries and the United Kingdom.

Information from all sources, amply confirmed by a study of the Press, indicates progressive deterioration in the state of the German meat supply. Horned cattle have diminished greatly in number, and successive catastrophic failures in regard to fodder have resulted in the survivors becoming a great deal more bony and a great deal less meaty than is desirable. The pigs of the Empire, which used to provide some 60 per cent. of the annual meat consumption, have been the victims of reiterated massacres; and, while fodder difficulties have undoubtedly been to some extent alleviated by these drastic proceedings, it is now being realised, with something akin to dismay, that of 27,000,000 pigs in the country at the beginning of the War only 13,000,000 were left by last year, and little more than 5,000,000 are available now. Efforts to regulate the supply

of pork, whether by the fixing of maximum prices (*e.g.*, in Alsace-Lorraine) or by the temporary local restriction of the trade in young pigs (*e.g.*, in Bavaria) have failed utterly.

The main staple of meat supply is, therefore, beef. Earlier in the summer the question had to be faced, whether the remaining cattle should be devoted to the maintenance of the milk supply or treated solely in the light of a prospective meat reserve. The latter view has prevailed; but the decision has not prevented a reduction (discreetly obscured, and broken very gently to the populace) of the meat ration. This would have been very well if, in the last weeks, the meat supply had not collapsed altogether. There was no time to accustom the public to the new state of affairs. Meatless weeks were instituted regardless of protests. The ration was reduced for the whole country (except Berlin), and the consequent tempest of indignation has made the office of German Food Controller more of a nightmare occupation than ever.

It comes out, in spite of intentional ambiguity from the official side, that Berlin (and, for the present, Stuttgart, though no one appears to know why) are to continue their normal ration of $8\frac{1}{2}$ oz. per week. A graduated reduction, according to the population of the town or district, has taken place, whereby the ration may be as low as $5\frac{1}{2}$ oz. Dutch workmen report that only a little over $5\frac{1}{2}$ oz. is the maximum to be obtained in the Rhineland industrial towns, and here supplementary rations are no longer distributed. Bavaria prefers to make her own arrangements, though it is not noticeable that the inhabitants of that country get any more, on the average, than the rest of the population. In some places (Berlin, Duisburg, etc.) part of the ration has to be taken in the form of sausage.

In Austria conditions are very much worse than in Germany. Steps have at length been taken to control meat, and the ration (of $3\frac{1}{2}$ oz. per week) is now obtainable on the surrender of pink coupons for the better qualities, and white coupons for the inferior kinds of meat, such as horse-flesh. Three meatless days in the week are observed in Austria and two in Hungary. As meat is unobtainable in the restaurants, and the available ration does not go very far, even in the most economical households, these days are probably not very different from the others so far as the mass of the population is concerned. Though a good deal of Rumanian pork was available earlier in the year (at nearly 4s. per lb.), none at all, Rumanian or otherwise, has been seen for weeks past, at any rate in Hungary. The rich can still obtain supplies at exorbitant prices through

illicit trade ; but this resource is becoming less and less productive. As in Germany, beef is now the chief kind of meat at the disposal of the consumer, and affords the best subject for comparative study.

12. United Kingdom ..	0 8½	0 10½	1 0½	1 2½	1 4

NOTE.—These are "representative" prices, *i.e.*, not in all cases the prices actually paid but prices computed with regard to all the relevant conditions as giving a fair average of the prices ruling, during the various years, in each country taken as a whole. In all countries there are local variations, and occasional abnormal quotations, due to special conditions. These factors have been duly considered in drawing up the above table.

The accompanying table shows the course of beef prices in various countries during the war. It exhibits startling differences, not only in actual prices, but in the relative increase, especially during the last year. In the United Kingdom prices have gone up exactly 100 per cent., and this increase has made itself felt quite severely enough. But even in the United States and Canada, where the conditions which make for the increase in European countries are not operative to anything like the same extent, prices have mounted by 33 per cent. and 60 per cent. respectively. The sustained regularity of movement observable in those countries can be found in the United Kingdom alone of European States. That is to say, it is unlikely that any influence other than the natural effect of war conditions has been allowed to react on the consumers' price of beef in this country.

Of enemy countries, Germany shows a rise of 270 per cent., and Austria-Hungary of 800 per cent. Even so, the German rise in price does not adequately represent the true facts of the case, since the ration is exceedingly small in the whole country ; even Berlin, which is especially favoured, receiving a very small allowance of meat per week. The German meat

diet, which used to be composed to a great extent of pork, is now nearly 90 per cent. beef; mutton is hardly ever eaten. In Berlin (and, for the present, Stuttgart) the weekly ration is $8\frac{1}{2}$ oz. Large towns have up to 7 oz., and smaller towns and country places may get $6\frac{1}{2}$ oz. if they are lucky. Some places have been forced to put up with no more than 5 oz. during recent weeks. In addition to this scarcity, at least four weeks during this autumn and winter (in Bavaria twelve weeks) will see no distribution of meat whatever beyond certain kinds of game, of which the prices are very high. Surreptitious trading is rampant throughout Germany, and any supplement to the exiguous rations mentioned above has to come from this doubtful source; and the price that has to be paid is many times the legal maximum. In Austria-Hungary conditions are even more deplorable. Meat has at last been rationed, and the citizens of Vienna may now exchange their coupons for $3\frac{1}{2}$ oz. per week.

The neutral countries abutting on Germany all show heavy increases, the increase per cent. since 1914 being:—In Holland, 166; Denmark, 200; Switzerland, 90; Norway, 600; and Sweden, 300.—(*National Food Journal*, 11th September, 1918.)

THE following Note is published at the request of Mr. James Hendrick, B.Sc., F.I.C., Strathcona-Fordyce Professor of Agriculture in the University of Aberdeen:—

**An Experiment in
War-Time Beef
Production.**

In an article in the August issue of the *Journal* (p. 549) Professor T. B. Wood gave an account of certain experiments which were carried out during the winter 1917-18 at a number of different centres in England, Scotland, and Ireland. One of these experiments, which was carried out at Craibstone, the Experimental Farm of the North of Scotland College of Agriculture, was under my direction. I would like to point out a few misconceptions with regard to this experiment which have crept into Professor Wood's article.

1. In the Craibstone experiment there were 20 Irish bullocks, as in the other experiments summarised, and also 20 home-bred bullocks. These were divided into four lots of ten each. In Professor Wood's account of the experiment the figures put down for the home-bred bullocks are those which apply to the Irish bullocks and *vice versa*.

2. In the table on p. 554 it is stated that the Irish cattle made an average gain of 9 lb. per head per week and the home-bred

cattle 10 lb. per head per week. Both lots made an average increase of 10 lb. per head per week.

3. It is stated that the Spencerfield experiment was under my direction.* The Spencerfield experiment was under the direction of Mr. Wm. Bruce, of the East of Scotland College of Agriculture. Only the Craibstone experiment was under my direction.

4. At Craibstone the cattle were tied up in pairs in stalls, and the dung had to be removed to an open dungstead outside. As the table on p. 554 stands it would indicate that this was not the case. The quantity of dung made per head is influenced to a considerable extent by the method of working, and is much smaller when made on an open dungstead from excreta and litter from cattle tied up in stalls than when made in covered courts or boxes.

5. The amount of litter used for the 20 Irish cattle during the course of the experiment, which lasted 18 weeks, was 7 tons 6 cwt., or 6½ lb. per head per day.

To leave for a moment these questions of fact, I would like to mention that I strongly disagree with some of the statements and deductions in Professor Wood's article. On p. 552 he states that the great increase in live weight made by the cattle at the Norfolk station was possibly "because the animals got a fair ration of good long hay." In the Scotch experiments the animals were kept for a preliminary period before the experiment proper began, and criticising this, Professor Wood says on p. 551: "This, no doubt, tends to scientific accuracy, but the method used at the Norfolk stations gives a better measure of the economic result." At the Norfolk Agricultural Station, Little Snoring, the cattle were weighed the day after they arrived from Ireland and were at once put upon the prescribed ration of roots, straw, hay and cake (p. 550). During the preliminary period, which at Craibstone lasted three weeks, the cattle made very great increases in live weight. This is to be expected. The cattle arrived from Ireland empty and hungry. A bullock has a very capacious alimentary canal which when filled stores a large weight of food. At Craibstone the cattle were not weighed until two days after their arrival from Ireland, when they had already begun to fill up. Nevertheless during the next three weeks they made an average increase of live weight of over 3 lb. per head per day. The great increase made at first gradually fell off as the animals got filled up, and a part of the great increase recorded at Little Snoring was, no doubt, due to the animals being weighed in the first instance when they were in a highly-fastened condition. I cannot think that this is a proper procedure, either from a scientific or from an economic point of view.

* The sentence making this statement was, owing to a clerical error, misplaced in the text.—ED.

It seems to me that another reason for the great increase made at Little Snoring was that the animals got a very heavy ration, over $1\frac{1}{2}$ cwt. per head per day, of roots. When animals eat such an excessive amount of watery food their weight is abnormally increased, partly because of the large quantity of material they have to carry in the alimentary canal and partly because other parts of the system become abnormally loaded with water. It seems to me that to compare the increases in weight obtained in this way with increases recorded as they were in the Scotch experiments does not give a useful or reliable result from either a scientific or an economic point of view.

THERE are only two rabbits known under market names, the "Wild" and the "Ostend."

**Preparing Rabbits
for the Table and
Market.**

The "Wild Rabbit," as its name implies, is just a wild rabbit paunched but not skinned.

The "Ostend" is a tame rabbit paunched and skinned, and so dressed that the breed cannot be easily detected.

Killing.—Rabbits intended for killing should not receive any food on the last day. Belgian producers are in the habit of killing a rabbit painlessly by holding it up by the two hind legs in the left hand and with the edge of the right hand striking it a sharp blow behind the ears. This method will always kill a young rabbit and leave no bruise. A short stick may be used, but care must be taken to strike at the right spot, because if struck too hard a bruise will be caused and discoloration of the head will appear after skinning.

Tame rabbits should always be bled after having been killed. Make an incision with a sharp-pointed pen-knife in the principal artery in a place near the jaw a little above the middle between the throat and back of the neck. If, as sometimes happens, profuse nasal bleeding occurs at killing, this last operation may be omitted.

Skinning.—Make an incision in either leg and hang the rabbit up with its hind legs as far apart as possible. Then begin cutting the skin open from the right hind leg, and inside the leg down to the back, opening up the other leg. Ease the cutting by pushing the finger under the skin. Cut the skin round the joints, taking care not to cut the sinews, and strip the skin down. Cut away all hindrance in front, and leave

a half-inch of tail bone on the body. Ease the skin front and back with the knife, then grasp with both hands and pull down as far as possible. To release front legs cut the skin as near the middle joints as possible, then pull the skin well over the head, cut out the ears quite close to the skull, and skin the head clean, but leave the eyes. If the skinning has been done right the skin will be whole excepting the cut between the hind legs. No skin should be cut down the belly part, as is the case with wild rabbits.

When the rabbit is skinned, remove from the pelt any particle of fat or flesh still adhering to it, or maggots may appear and damage the skin. Pay particular attention to the tail and head in this respect.

When the skin is ready for drying, fasten it to a board by pegging the extreme top leg ends to the board, stretch the skin longways and across, and then peg down the sides (at the open edges) and the head. If the tail end remains damp, or any part of the skin crinkles, stretch and peg the ends so that air may reach them. Sunlight is to be avoided.

To keep moths and maggots away from fur, dust the skin with naphthalene.

Do not bruise the pelt by rough handling, as when dry the bruised part of the pelt so handled is discoloured, which may lower its value.

After skinning, the rabbit should be paunched at once.

Paunching.—This should be done very carefully. First hold the rabbit up by the ears and press the lower part of the belly with a downward movement to empty the bladder. Then, with the point of a knife, make an incision from the chest bone right up the belly, just deep enough to cut the skin and not so deep as to injure the intestines. This danger may be avoided by using a pair of sharp scissors here. Cut the ligaments by which the hind legs are joined to the belly and press back the legs so that the inside is easily accessible. Now remove the intestines, but leave liver, lungs, heart and kidney intact. Great care should be used in taking out the gall from the liver.

Stend Style.—Having skinned and paunched the rabbit as above, cut off the paws of the front legs, and if the colour of the back paws is different from that of the wild rabbit cut these off. Press the stumps of the front legs into two slits made in either armpits between the first and second rib, pass the right hind leg through an opening made in the left leg, skewer

the carcass with a thin stick across the back to show the inside, wipe away all stains, and the "Ostend" rabbit is ready for shaping.

Shaping.—Arrange rabbits of equal size on a board or L-shaped shelves arranged one above the other in a cool and darkened house. Place a board on the rabbits, weight it down and allow it to remain until carcasses are quite cold, when they will have a plump appearance.

Packing.—Place in boxes or hampers lined with clean white paper, a sheet between each layer and on top, and pack closely. Labels should be firmly secured to packages, addresses plainly written and the quickest method of transit chosen.

*(This article is also issued as Food Production Leaflet No. 30.
Copies may be obtained post free on application.)*

THE season opens with marked inequalities between one part of the country and another. Whilst some farmers, especially in the Eastern counties, secured their harvest in record time, and were thus in a position to push well forward with their work, others have not yet (8th October) succeeded in carrying their corn, but have the mortification of watching it steadily deteriorating in the stook. The result shows itself not only in the amount of corn available for sale, but in the state of forwardness of the work for next season; for while corn is still out it is not possible to push on with preparations for the new crops, and the damage done this year is carried into next.

Nor is this the end of the farmers' troubles. The raising of wages and the reduction of working hours have increased the cost of all farming operations, but there is no corresponding increase in prices. The way to meet the case is to increase production. This may be possible through the better use of artificial fertilisers and better choice of varieties of crops. Unfortunately artificial fertilisers are not obtainable in unlimited quantities, and farmers may be compelled to adopt methods they would rather have avoided.

Manures should be Ordered Early and Stored Properly.—In this season, as in last, it is eminently desirable to place orders early so as to ensure delivery of fertilisers. If this is done, however, it is essential that satisfactory storage room should be available.

Artificial Fertilisers will not tolerate Wetness: they must be kept in a closed shed, be covered with a watertight roof, and stand on a floor to which water cannot gain access. If the place is perfectly dry the fertilisers may be turned out from their bags and stored in a heap, but if there is any suspicion of dampness in the floor, it is safer to keep the manures in their bags, placing these on hurdles or bundles of faggots so as to allow of some circulation of air. If rain leaks in, however, and cannot be excluded, the place must be condemned as unsuitable.

Quantities to Order.—In the past artificial manures have been used very unequally: one man might use 10 cwt. per acre for his potatoes and another, not far off, only 2 to 3 cwt. In present conditions of supplies very heavy dressings ought not to be used unless there is definite evidence that so much is needed. The custom of the district is not always an infallible guide in this matter: fortunately there are large numbers of local experiments that afford useful help in coming to a decision.

As a general rule, **Wheat** grown after potatoes, mangolds, or clover will need no artificial manures. Exceptions arise where the crop does not usually start growth quickly or ripen sufficiently early; in these cases superphosphate or basic slag should be applied: $1\frac{1}{2}$ to 2 cwt. of superphosphate, or 3 to 4 cwt. of basic slag might be given, and it should be applied at the time of sowing the seed. The heavy dressings of basic slag used in some parts of the Eastern and Midland counties should only be given where there is sound reason to suppose them necessary.

Barley grown after roots which have been fed to sheep on the land may need superphosphate if there is reason to fear that the crop will become lodged. In present circumstances $1\frac{1}{2}$ to 2 cwt. per acre might be allowed for this.

Oats may repay rather more generous treatment, and if they are receiving no dung may have $\frac{3}{4}$ to $1\frac{1}{2}$ cwt. sulphate of ammonia, 3 cwt. of superphosphate, and if the soil is light 2 cwt. salt per acre.

Corn crops following a previous corn crop will also require liberal treatment: $\frac{3}{4}$ to $1\frac{1}{2}$ cwt. sulphate of ammonia according to the condition of the land, 2 to 3 cwt. superphosphate, or double this quantity of slag, and on light or chalky soils 2 to 3 cwt. of salt. Some farmers would be inclined to give more: in a case recently brought to the notice of the Rothamsted Experimental Station the farmer was proposing to add 2 cwt. of bone meal to this mixture, but the addition could not be

recommended as there was already sufficient plant food for the needs of the crop.

Roots require very careful consideration. In many parts of the country it is customary to give dung and, in addition, heavy dressings of artificials. For swedes and turnips this plan cannot as a rule be recommended. Large numbers of experiments have shown that swedes and turnips do not generally respond to these heavy dressings, and equally good results have been obtained with smaller applications. Unless, therefore, a farmer has very definite evidence that the artificials will really give a useful return he should not use them too liberally. The practice of giving a small dressing of superphosphate to "bring the roots to the hoe" is, of course, justifiable. One-half cwt. of sulphate of ammonia and 3 cwt. superphosphate might be allowed, but no one should apply the 8 or 10 cwt. per acre of artificials, sometimes used in addition to farmyard manure, unless he has very good reason to expect an adequate return.

This subject is so important that further reference will be made to it later on.

Mangolds present rather a different case as they more definitely respond to fertilisers than swedes or turnips; indeed, no crop is grown that responds so clearly. In most cases it is advantageous to supply a complete dressing: a useful one would be 1 to 1½ cwt. of sulphate of ammonia, 2½ cwt. of superphosphate, and 2½ cwt. of salt per acre in addition to dung.

Potatoes also respond to dressings of artificial fertilisers, though it is by no means clear that they justify the heavy dressings sometimes given. In potato-growing districts it is not unusual to apply 10 cwt. of artificials. In peace time, or when there is abundance of fertilisers, there is not much to be said against this plan, and the possibility of increased crops may justify it; but in war-time, when fertilisers are scarce, it becomes absolutely necessary to economise, and large dressings should not be given *unless there is definite evidence that they are needed by the crop*.

Grass Land presents rather serious difficulties. It is imperative that as much grass as possible should be grown on the reduced acreage so as to provide the farmer with the keep he needs and the Forage Committee with the hay that is indispensable for the Army. If unlimited supplies of fertilisers

were available the problem would be relatively simple : basic slag could be used on great areas of grass, especially where the soil is on the heavy side, and in many cases sulphate of ammonia could be applied to give increased bulk of hay. Unfortunately, however, fertiliser supplies are not unlimited, and where there is any restriction it is sound policy at the present time to look after the arable land first and only to give the grass anything that is left over.

Grass land may be considerably improved by cultivation during winter and spring, by cutting down tufts of coarse grass or throwing salt on to them so that stock will graze them down closely. Attention to the ditches and the drain-pipes often effects marked improvement, and in many cases mole drainage is of great benefit. On light soils or in dry situations 3 cwt. of salt per acre may often be of value.

Liming.—During the winter every opportunity should be taken to apply lime, limestone or chalk to soil that needs it. There is still a surprising amount of land in the country requiring this treatment. Samples of soil are not infrequently sent in to the Rothamsted Experimental Station with a request for information as to why crops will not grow satisfactorily : one of the commonest causes of failure is lack of lime. *It cannot be too strongly urged that none of the artificial fertilisers now in use does away with the necessity of adding lime to the soil.* Basic slag and nitrolim help in this way, but they are not sufficient.

It is very desirable that the War Agricultural Committees should emphasise the need for applying lime to the soil and organise methods by which this can be done. The difficulties are less when the work is carried out on a large scale than when each individual farmer tries to do it for himself. The judicious use of lime, combined, when necessary, with attention to drainage, would help very considerably in the economy of fertilisers.

Having calculated the amount of fertilisers needed the next step is to *order without delay*, even the fertilisers that will not be wanted until spring, and store them as directed above. It has been mentioned that either superphosphate or slag can be used on arable land, but in present circumstances there is a good deal to be said for preferring superphosphate : 1 ton of superphosphate goes as far as 2 tons of slag on arable land, and in some districts may prove more easy to obtain.

It must not be supposed that the recommendations given here imply any change of opinion as to the effectiveness of fertilisers. The need for careful economy arises from the fact that supplies are low and must therefore be used to the fullest possible advantage. As soon as conditions become more normal the whole case will, it is hoped, have completely altered.

ACCORDING to an abstract in the *International Review of the Science and Practice of Agriculture*, June, 1918, the *Comptes rendue des Séances de l'Académie d'Agriculture de France*, 13th

Green Manuring. March, 1918, describes the results obtained by M. Brétignière with clover and trefoil used as green manures. The sowing of these two leguminous plants in cereals is highly recommended. It is held that the practice, which is already adopted in some cases, should be general, especially in view of the shortage and high price of nitrogenous manures. It is stated that by this means, as at Grignon from 1913 to 1916, the growing of three successive cereal crops becomes possible. The following table shows the increase in yield obtained when oats were sown after green manuring as compared with oats grown without green manuring :—

						Grain. Cwt. per Acre.	Straw. Cwt. per Acre.
Oats after	trefoil	8.95	14.96
"	clover	6.27	10.79
"	vetches	4.32	4.84
"	white mustard	0.42	1.14

The superiority of the trefoil and clover is obvious, especially that of the trefoil, which has the further advantage of costing considerably less than clover.

Besides the trefoil and clover recommended by M. Brétignière, Professor M. Schribaux, at the Institut National Agronomique, advises the use as green manure of crimson clover, which is to be recommended on account of its rapid growth and the relatively low cost of its seed. Fenugreek might also be useful for the same purpose, especially in the south of France, on account of its hardiness and well-developed roots. It is suggested that the value as a green manure of white melilot, already used as such in America, might also be investigated.

MEASURES are in hand by which the supply of cattle feeding stuffs for winter will be much improved. There are not large stocks of linseed

Provision of Feeding Stuff*.

cake, much less of cotton cake, and it is not possible to accept a suggestion made in some quarters and release barley to stock-owners ; but the experience of last winter will not be repeated, though the position is, of course, abnormal still. A new

* See also pp. 888-94, and 915.

Rationing Order is in course of preparation, and its completion is only delayed until the Maritime Council determines exactly what amount of tonnage can be spared for the import of feeding stuffs. Meanwhile control of the milling trade in regard to offals is being sharpened, millers having been served with a notice that they are to supply offals no priority certificates only, until the holders of certificates shall have been satisfied. Stock owners may obtain priority certificates in respect of dairy cattle, breeding sows and young pigs on application to their Live Stock Commissioners, and should apply forthwith if they have not applied already. This temporary measure will ensure, pending the Order's issue, that those who are entitled to millers' offals shall receive whatever may be their share of the new milling.

In regard to the demand for barley, the Food Controller has carefully reviewed the situation. But, in view of the necessity of securing for the loaf an adequate amount of suitable diluents, it is evident that if any partial release of raw barley were permitted, the enforcement of the Grain Orders would be practically impossible. He has had to decide that no barley which is fit for use in human food shall be sold or used except for either milling for human consumption, malting, munition spirit distilling, vinegar-making or other licensed manufacture. But the extraction in the milling of barley will be considerably reduced. Compared with the amount of offal obtained during the past season, a much larger quantity should be forthcoming for stock-feeding purposes; and the feeding value of the new season's offals will be very much higher than that of offals obtained from the old extraction.

The instruction to flour millers to the effect that all certificates received by them must be given strict priority applies not only to holders of certificates, but also to any dealer who may have had a certificate passed on to him by the holder. In order to ensure delivery, it is necessary for the dealer to send his certificate to the miller with his order. Stocks of cotton cake have been conserved during the summer months in order to meet farmers' needs during the autumn and winter; but, as a small quantity of cotton cake is necessary for dairy cattle in summer, manufacturers were allowed to deliver supplies against priority certificates on the basis of $\frac{1}{2}$ cwt. of cotton cake per cow.

Palm kernel cake has also been conserved; but, in order to meet the needs of pig-owners, about 2,000 tons have recently been released and distributed throughout the country through the medium of the County Feeding Stuffs Committees. This cake is only allowed to be delivered against priority certificates for pigs.

Instructions to a similar effect have been sent to the compound cake and meal manufacturers with regard to pig meal. To save transport, however, a manufacturer is allowed to deliver a maximum quantity of two tons to any one dealer or agent without the production of certificates, provided the dealer or agent gives an undertaking in writing to the effect that he will only dispose of it in fulfilment of priority certificates. Further, in order to meet the needs of the very small buyer, instructions have been given that quantities of 1 cwt. or less may be sold without the production of certificates.

It should be clearly understood that, as regards Great Britain under the Cereals (Restriction) Order, 1918, which came into operation on 1st September, no farmer may use as feed for his live stock any damaged

wheat, rye, barley and dredge corn, for any tailings, dressings, or screenings of wheat, rye, barley and dredge corn unless he holds a licence in writing from the Food Controller.

This announcement does not affect the concessions already promised to small holders and to persons cultivating excess acreage, as to which a special Order is being issued.* (*National Food Journal*, 11th September, 1918.)

EARLY in the summer of 1917 it became evident to the Commissioners of the Board of Agriculture and the Food Production Department that the fruit crop for that year was

- **Pulping Fruit for Jam.** likely to be exceptionally large. Several schemes were accordingly devised, beginning with domestic bottling and other methods of preservation, leading up to a big commercial venture, for the pulping of fruit wherever there was an anticipated surplus. Another consideration which caused the Food Production Department to take action was the assurance they received from the railway companies that waste must inevitably occur because they were quite unable to lift the fruit of Kent and Worcestershire on anything like the scale upon which they had been accustomed to handle it in normal times. In order to avoid such important loss, Treasury sanction was obtained for the equipment of a number of pulping stations and for the purchase of the surplus fruit of localities in which the stations were situated.

These first stations were particularly meant to deal with the plum crop, and were established at Maidstone, Pershore, Marden, Cheltenham, Sittingbourne, Cambridge, Newport (Salop), and Bewdley; while additional stations were prepared at Totnes and Bridgwater to deal with the enormous surplus of apples in Devon and Somerset. Further, the Research Institute of the Bristol University at Long Ashton and a small station at Wedmore, in Somerset, were equipped with plant for the production of apple jelly. The total quantity of pulp laid down at these stations was 10,032 tons, made up of 3,760 tons of plum pulp, 3,520 tons of damson pulp, and 2,752 tons of apple pulp, the whole of which was subsequently dispatched to controlled jam firms, made into jam and distributed to the Forces or to the civilian market under the instructions of the Ministry of Food. Roughly, 48,000 barrels of fruit were stored last year, the average barrel containing from four to five hundredweight of pulp.

A creditable fact in connection with the handling of this tonnage over long distances by rail is that losses from all causes amounted to 1.68 per cent. only. Innumerable baskets had to be hired in which to transport fruit to the pulping stations. This year better arrangements have been made. As the basket makers could not undertake contracts because they had not the raw materials, the Ministry bought a number of osier-beds as they were growing in six or more counties. The osiers were in due time harvested and are now being made into baskets by firms all over England, with whom contracts have been made for over 300,000 baskets. Depots for the sorting and harvesting of the osiers are established at Buckingham, Gloucester, and Somerset.

The importance of pulping becomes at once apparent when it is understood that the process consists of a thorough sterilisation of the fruit, so that it may be kept for conversion into jam at a later date.

* See p. 873.

It merely enables the jam-making to be deferred until a convenient opportunity. Taking the jam-boiling "life" of fresh plums to be a month, this in the absence of pulping facilities would mean that the jam firms must work night and day on it; whereas if, in a glut season, you can temporarily preserve the fruit, you extend the jam-boiling life indefinitely, and even into the winter months. The fruit is sterilised by preliminary cooking and then stored in barrels, which have themselves been very carefully sterilised before use. A pulping station when in full work gives employment to about a hundred hands. Previous to the War Great Britain was far behind other countries, and particularly Germany, in the use of pulping and other scientific methods. Certain of the larger firms had been pulping for a number of years, but, generally speaking, the methods of the smaller firms were such that only a very inferior article was produced, and there was a widespread prejudice against the use of fruit-pulping for jam-making. Chemists employed by the Ministry have been carrying out continual research as to the best methods of laying down pulp, and it is considered that the method at present in use is an advance on any previously used in this country or in any other.

Assistance has been given to a large number of jam firms in the United Kingdom, both with plans of the plant in use and with information as to the technical processes involved, and it may be pretty confidently asserted that the pulping stations now owned by the Ministry and by private firms will be capable of dealing with all surplus fruit in the years to come, and will largely, if not entirely, render unnecessary the importation of jam from other countries.

Two pleasing features of this department of the Ministry's activities may be summed up very briefly. The undertaking, far from being a charge upon the public funds, has not only proved self-supporting but has shown a profit that gives a good return upon the capital involved; and the scheme has been so satisfactory to fruit-growers that the Ministry is in almost daily receipt of requests to set up further stations in the fruit-growing districts.

One station is being discontinued, viz., that at Cambridge, from which the plant is being removed to a point nearer to the fruit-producing area of the Isle of Ely, and a new station is being equipped at Erith Bridge. Premises have been secured, and plant is either installed or in course of installation at Faversham, Doncaster, Evesham, Paddock Wood, and Walpole Crosskeys, Norfolk. Buildings have also been secured and are at present being used as stores, to be later equipped with pulping plant if next year's fruit prospects justify the step, at Worcester, Upton-on-Severn, Newnham-on-Severn, and Wisbech. The Wedmore station has been discontinued for the time being, for the reason that jelly making is only approved in glut areas, and this year there is no glut. Arrangements have been made for continuing the apple-jellying process at Hereford and Hele if justified by the crops, but that will not be this year, as all the apples are required for jam.

As evidence of the promise of permanence in the new industry, it is enough to add that frequent applications have been made by fruit-growers and jam manufacturers desirous of purchasing the pulping-stations and their plant. The Ministry, however, purposes to retain them all, at any rate for the duration of the War. (*National Food Journal*, 11th September, 1918.)

MANY bee-keepers make the mistake of attempting to winter the nuclei they have obtained by artificial increase in such a weak condition that they often do not survive the

Methods of Obtaining cold weather or the long confinement in the **Strong Stocks of Bees** hive during the winter.

for Over-wintering. In order to avoid failure from this cause

the nuclei should be made early in the season, so that by the end of July at least four combs are filled with brood and well covered by bees. The colonies must then be built up during August and September into stocks which are sufficiently strong to winter successfully.

Union of Weak Nuclei.—Nuclei consisting of less than four combs at the end of July should be united to form strong stocks. After selecting two or more nuclei for union, move them gradually together, not more than a yard daily, and only on fine days when the bees are flying, until they are side by side and almost touching. Allow them to remain two days in this position and then towards evening on the second day unite the stocks in one hive. This is carried out as follows: First, remove all the combs in each nucleus not covered with bees, then, after selecting and caging the best queen on a comb in the permanent hive, remove the other queens. Then, after the bees on all the combs have been well dusted with fine pea-flour, place them in the permanent hive properly interspaced. The empty hives are then removed. The operation is completed by releasing the caged queen twenty-four hours after the colonies have been united.

Addition of Frames.—The process of building up is carried out by the gradual addition of frames fitted with full sheets of wired foundation so that the bees can build them out into combs and fill them with brood and food, and in this way increase the strength of the stocks.

The frames must be added one at a time, and should be inserted in the centre of the brood nest. Another new frame should be inserted as soon as the previous one has been drawn out completely, and is not only filled with brood, but is also well covered with bees; several new frames should never be inserted at one operation.

If the apiary contains established stocks of bees, combs of brood may be taken from these and given to the nuclei, thus ensuring more rapid "building up." Only combs containing good-sized patches of *sealed brood* should be taken, for if unsealed brood is given the strength of the bees in the nucleus is overtaxed by the extra labour expended in feeding the brood and in keeping the extra space warm. Not more than two combs of brood should be taken during the season from any one stock, and then only one at a time, at an interval of at least a fortnight between the removal of the first and second combs.

The combs of brood must be given to the nuclei one at a time and inserted in a similar way to new frames of foundation, *i.e.*, in the centre of the brood nest.

It is not absolutely necessary to have the full complement of ten combs in the hive, as the bees will winter quite safely on eight. In fact it is much better to winter the stocks on eight well-filled combs than on ten which are only partially completed.

Temperature of the Hive.—The temperature of the hive must be maintained at about 98° F., not only to enable the bees to secrete wax, but also for brood-rearing. The bees generate heat to a large extent by the movement of various parts of their bodies as well as by

the normal means of respiration and the consumption of food. Thus, if they occupy too large a space, the temperature of the hive can only be maintained at the expense of energy required for comb-building, nectar-gathering and brood-rearing. Also too much room often results in the combs being drawn out very irregularly, or else in bulges, owing to the extent to which the working capacity of the bees is taxed.

The nucleus, when formed, is usually placed in a nucleus hive or temporary box, but as soon as it consists of four well-covered combs, it should be transferred to a full-sized hive, and the bees crowded together on the combs by means of a division-board, until after the gradual addition of frames, eight or ten combs are in use.

Feeding to Increase Brood-rearing.—In most districts few nectar-yielding flowers are in bloom after July onwards, and only a small quantity of natural food can, therefore, be collected by the bees; in any case the supply is not sufficient to yield a surplus after the daily needs of the bees have been furnished. It is most necessary, therefore, to supplement the natural food supply by feeding with syrup to induce the colony to continue building out more combs and rapid brood-raising. This syrup must always be fed at this time of the year through a slow feeder, giving just sufficient for the purpose; otherwise, if a rapid feeder is used, the bees will store the surplus syrup in the cells which have been drawn out recently, instead of using them for the rearing of the brood.

A "regulation bottle-feeder" should be used, if available, access being confined to not more than three holes. The bottle should be refilled before it becomes quite empty.

Making Syrup.—Syrup for feeding can be made either from ordinary white cane sugar by dissolving each 1 lb. of sugar in half a pint of water by heating over the fire, or else from medicated candy by dissolving each 1 lb. cake in 10 oz. of water in a similar manner. It is advisable to medicate the syrup made from plain sugar with a strong antiseptic. Izal, Bacterol, or Flavine, may be used for this purpose in the following proportions: One teaspoonful of Izal to every 8 lb. of sugar, one teaspoonful of Bacterol to each 1 lb. of sugar, and one grain of Flavine to each 1 lb. of sugar.

To Prevent Robbing.—In order to prevent robbing, the entrance to the hives must not be wider than $\frac{1}{2}$ in. during the whole of the time feeding is taking place, and the syrup, which should be warmed, must be given late in the evening.

Feeding for Winter Storage.—Towards the end of September, rapid brood-rearing will cease, and the syrup should then be fed more rapidly, so that the cells not required for brood-rearing may be filled with food and sealed over before the cold winter weather sets in. All the nine holes of the "regulation feeding-bottle" should then be exposed to the bees.

Feeding Candy.—If there is the slightest doubt that the supply of food contained in the combs is insufficient to carry the bees through to the following spring, a cake of candy should be placed over the frames when packing down for winter. The candy supply should be renewed from time to time if required. The entrance to the hive should remain open about 5 in. throughout the winter.

Late Swarms.—Late swarms can be built up and strengthened in a similar manner with equal success. The swarms should be first hived on to ten frames of foundation, but after about three days in the full

hive they should be "closed up," and the bees crowded together by means of a division-board, until all the frames are well covered with bees. The surplus frames should then be removed, and feeding to obtain rapid brood-raising should commence.

(This article is also issued as Food Production Leaflet No. 55, copies of which may be obtained free of charge and post free on application to the Secretary, Board of Agriculture and Fisheries, 3, St. James's Square, London, S.W.1. Letters of application so addressed need not be stamped.)

REPORTS received by the Food Production Department indicate the increasing seriousness of Silver Leaf disease in fruit trees. In some localities it has become almost a scourge, and some of the most valuable varieties of plums, especially Victoria, are threatened with extinction unless drastic measures are taken to check its extension. The disease occurs also in apples, but less frequently.

The Menace of Silver Leaf.

Unless active steps are taken to combat it, Silver Leaf spreads relentlessly. It cannot be too widely known therefore that if the affected trees are systematically and energetically dealt with it is possible very largely to control the disease. *By promptly cutting out silvered branches and by rigorously removing all dead trees, or trees which have begun to die back, it has been proved in practice that the spread of the disease is checked.* No other treatment can as yet be advised.

In view of the urgent need of combating Silver Leaf, the Food Production Department strongly urge fruit growers throughout the country, especially in the important plum-growing districts, to take energetic measures to destroy all trees which have begun to die back, and to cut out the silvered branches of trees otherwise healthy. It is worth some sacrifice to take this in hand at once; for the fungus fructifies chiefly in autumn, and the longer the dead wood bearing the fungus is allowed to remain the greater is the risk of infecting other trees. As it is unlikely, however, that this work can be completed before the leaves fall, all silvered branches and trees which are dying back should be conspicuously marked at once, so that they can be removed so soon as opportunity permits.

In carrying out these operations the following points must be borne in mind:—

1. The minute threads of the fungus are often to be found in the tissues of the wood considerably further down the branch than the level at which the silvered leaves appear. Affected branches should therefore be cut back to a point where no brown stain in the wood can be found.
2. All wounds made by severing branches should be pared over and covered with Stockholm tar. In the ordinary routine work of the garden also care should be taken to avoid injuring plum trees and to apply Stockholm tar to all wounds.
3. Dead or dying trees should be completely grubbed up. Exposed stumps on which the fungus can fructify should not be left in the ground.
4. Severed branches and trees that have been grubbed up should be removed from the plantation immediately and be used for firewood. Small branches should be burnt on the spot. If it is necessary to keep the firewood for any time, it should be stored as far away as possible from fruit trees and preferably

in a shed. To cut down dead trees without subsequently removing them is utterly useless ; and to keep a wood-pile in or near a fruit garden is a practice that cannot be too strongly condemned.

The success of the above measures largely depends upon the co-operation of all fruit growers, including the owners of fruit trees in private gardens. Neglected fruit plantations are not only a great danger to other trees, but also to those orchards which are maintained in a proper and sanitary condition. In view of the threatening character which Silver Leaf disease has assumed, it is earnestly hoped that an active campaign against it on the lines indicated above will be commenced and maintained in all parts of the country.

Apple and Pear Trees.—In the general absence of fruit this season, the present time affords a suitable opportunity for carefully attending to the trees whilst the leaves are on, shortening back all summer growths, other than leading shoots, to about five eyes, and thoroughly thinning out the whole tree by removing all unnecessary branches. Too frequently fruit trees are merely headed over and are thus left with a dense mass of growths on the top, a cramped centre, and bare below ; whereas, if properly pruned and thinned, they would very likely produce fruit from the base to the top, such as is seen on a cordon-formed tree.

Currant Bushes.—Currant bushes, where not yet pruned, should be attended to immediately, the trees spurred in and any branches that are crowding removed. Often in cottage gardens the currant bushes are left far too thick, with the result that the quality of the fruit suffers.

Raspberries.—These should be carefully gone through and all old canes removed, as well as any surplus young growths, and those of the latter which are retained tied securely to stakes, or wires if the latter are used for supporting the growths. The best and strongest should always be selected for this purpose. If the wood that is removed is not burnt with a view to returning the ashes to the soil for manurial purposes, the old canes may be tied up in bundles and stored in a dry place, as they will be found useful for staking things requiring light support next season.

THE following Notes on the testing of seeds at the Official Seed Testing Station are issued for the information of farmers* :—

Charges for Seed Testing at the Official Seed Testing Station.

Kinds of Seeds to be Tested.—The kinds of seeds that will be tested are those included in the Order (see this *Journal*, July, 1918, p. 477). In addition, seeds of the following plants will also be tested for farmers for their own information : flax or linseed, maize or Indian corn, buckwheat, and mustard.

*Full information as to seed testing under the Testing of Seeds Order is given in Food Production Leaflet No. 47, copies of which may be obtained post free on application.

Fees to be Paid.—A report will be furnished to *bona-fide* English and Welsh farmers at the rate of 3*d.* per sample on seed which the farmer himself is proposing to sow. Samples to be tested at the 3*d.* rate must be accompanied by an undertaking that the test is not required in connection with a declaration for sale. In the case of tests which a farmer requires for the purpose of a declaration for sale, he is required to pay the fees chargeable to seedsmen, viz., 1*s.* per sample for cereals, 1*s.* 6*d.* for roots and vegetables, other than mangolds and beet, and 2*s.* for mangolds, beet, grasses and clovers.

If the fee does not accompany the sample no notice will be taken of it. When the fee or fees payable amount to 6*d.* or over, the remittance must be made by postal order which should be made payable to—"Food Production Department, 72, Victoria Street, London, S.W. 1."

For a single farmer's test three penny stamps may be sent.

Directions as to sending samples to the Station are given on p. 883.

OFFICIAL NOTICES AND CIRCULARS.

N.B.—The Orders which may be mentioned in this section of the JOURNAL may usually be obtained at the price of 1*d.* each from H.M. Stationery Office, Imperial House, Kingsway, London, W.C. 2, and 28, Abingdon Street, London, S.W. 1; 37, Peter Street, Manchester; and 1, St. Andrew's Crescent, Cardiff.

THE following Circular Letter (No. C.L. 79/C. 1) was addressed to Agricultural Executive Committees by the Food Production Department of the Board on 20th September:—

The Food Production Programme for 1919.

SIR,—At the recent conference with the Chairmen of the Executive Committees I promised to circulate those portions of the notes from which I spoke which have reference to the details of surveying and breaking up grass land. This memorandum is now sent herewith,* and I would urge that immediate arrangements should be made for carrying out a survey and classification of grass land on the lines suggested. A specimen card showing the particulars which should be recorded will be sent to you in a few days.

In regard to the breaking up programme, I think it desirable that committees should not contract for ploughing up stubbles beyond a limited period of time. It is realised that for getting in a big wheat area this year tractors may have to help on the stubbles for the next six weeks or so, but as the policy of the Department in purchasing tractors was, and is, to have available a means of breaking up additional grass land and cultivating additional plough land, it is only reasonable that the first call upon the Government's tractors should be devoted to this purpose.

* Printed at p. 841.

This is written to the Chairmen of Committees and Executive Officers as a hint rather than as an instruction at this moment. It may be necessary to give some more definite ruling on this point in the near future, and in the meantime the matter is mentioned so that tractors may not be fully booked up from November onwards for other work than breaking up grass land.

I am, etc.,
(Signed) CHARLES FIELDING,
Director-General.

AN Order (No. 1099), dated 4th September, 1918, has been made by the Food Controller, to the effect that :—

**The Small and
Additional Acreage
Order, 1918.**

1. Notwithstanding the terms of any Order to the contrary it shall be lawful for—
 - (a) A person whose total acreage under cultivation in the year 1918 does not exceed, in England or Wales 1 acre, in Scotland 5 acres, or in Ireland 10 acres, to use the cereal crop (other than wheat) harvested on such land in the year 1918 for the purpose of feeding any livestock belonging to him ;
 - (b) A person who in England or Wales has ploughed permanent grass land in excess of any amount of such land directed to be ploughed for cultivation in the year 1918 by any directions of the Executive Committee given prior to 9th March, 1918 (hereinafter called Excess Land), to use for the purpose of feeding any livestock belonging to him such part of his total cereal crop (other than wheat) harvested in the year 1918 as shall be certified by the Food Controller to be equal in amount to the cereal crop (other than wheat) harvested on his excess land in the year 1918, provided that :
 - (i.) Such person before ploughing such excess land shall have given particulars of the excess land to the executive committee ; and
 - (ii.) Such person before ploughing excess land shall have obtained a Cultivation Order from the Executive Committee.
2. Every application for a certificate of the Food Controller under Clause 1 (b) of this Order shall be made on such form as shall be prescribed.
3. The Food Controller may from time to time give any directions that he may think proper for securing that no cereals not authorised by this Order shall be used for feeding livestock in contravention of any other Order made by the Food Controller, and every person using cereals for feeding livestock by virtue of this Order shall duly comply with any such directions and every such person shall give to the Food Controller all such information as he may from time to time require as to the disposal of the residue of his crop of cereals.
4. Nothing in this Order contained shall authorise the feeding of any livestock in contravention of the Horses (Rationing) Order, 1918.*
5. For the purposes of this Order :—
The expression "Executive Committee" in connection with any land shall mean the Executive Committee exercising

any of the powers of the Board of Agriculture and Fisheries under Regulation 2M of the Defence of the Realm Regulations for the County or County Borough in which such land is situated.

The expression "permanent grass land" shall mean such land as has been grass land during the whole of the five years immediately preceding the date of this Order.

THE following Circular Letter (No. A/314/6) was addressed to the County Councils in England and Wales by the Board on 11th September :—

**The Purchase of Land
Suitable for
Small Holdings.**

SIR,—I. I am directed by the President of the Board of Agriculture and Fisheries to state that as a result of the receipt of a resolution dated the 8th July last from the Gloucestershire County Council, a resolution since endorsed by a number of other councils, he approached the Treasury with a view to obtaining their sanction to the purchase by county councils of land suitable for small holdings out of balances in the hands of the councils.

2. The Treasury have now informed the Board that they will not raise objection to the proposal that the purchase money for land suitable for small holding purposes may be provided out of balances in the hands of the county councils on the understanding that :—

- (i.) Each case will require the sanction of the Board of Agriculture and Fisheries ;
- (ii.) Such sanction will only be given where the land is specially suitable and is offered on advantageous terms and cannot be obtained by way of lease or purchase by rent-charge ;
- (iii.) Only such balances are used for the purpose as are not likely to be required for other purposes for some years, and that the fact of their having been so used shall not be regarded as giving the councils a claim to borrow from any Government Fund for the purposes to which they might otherwise have been applied.

3. I am to explain that the total expenditure which the Treasury are prepared to approve on these lines is limited to £100,000, and that the arrangement does not remove the embargo on the councils' borrowing powers which still remains in force. The concession is only intended to apply to cases where the acquisition of particular areas of land is exceptionally desirable.

4. I am to ask that any proposals that may be submitted to the Board for the purchase of land for small holdings in the above circumstances may be accompanied by a plan of the property, together with full information as to the reasons why the acquisition of the land is specially desirable.

5. Mr. Prothero will also be glad to be informed in each case as to whether efforts have been made by the council either to acquire the land on lease, or to purchase it on the terms that payment shall be made by way of a rent-charge or other annual payment.

I am, etc.,

(Signed) A. D. HALL,

Secretary.

THE following Circular Letter was addressed to the County Councils in England and Wales by the Board on 16th September :—

**Settlement of
Ex-Service Men on
the Land.**

SIR,—1. I am directed by the President of the Board of Agriculture and Fisheries to acquaint you that under the provisions of the Small Holding Colonies (Amendment) Act, 1918, the object of which is to provide land for ex-Service men, the area of land which may be acquired for the establishment of small-holding colonies has been raised from 4,500 acres in England (excluding Monmouthshire) and 2,000 acres in Wales and Monmouthshire (as provided by Sub-section (3) of Section 1 of the Small Holding Colonies Act, 1916) to 45,000 acres in England (excluding Monmouthshire) and 20,000 acres in Wales and Monmouthshire.

2. I am further to acquaint you that the amending Act provides that “ the Board may, as respects any county, with the consent of the council of that county, employ that council as their agents, and vest in them all the powers hereby or by the principal Act conferred upon them, in addition to those vested in such council by virtue of the Small Holdings and Allotments Act, 1908,” and “ that no portion of the additional land authorised by this Act to be acquired by the Board of Agriculture and Fisheries shall be so acquired except after consultation with the Chairman of the Council of the county in which the land proposed to be acquired is situate, or with a committee of that council.”

3. The amending Act further provides that “ the land shall not be acquired otherwise than by taking the same on lease, or purchasing it in consideration of the grant of a rent-charge or other annual payment, or by taking the same in feu.”

4. In this connection I am to remind you (a) that Section 40 (1) of the Small Holdings and Allotments Act, 1908, enables a limited owner to lease land to a county council for the purpose of small holdings for a term not exceeding 35 years, either with or without a right of renewal, for a further term not being less than 14 nor more than 35 years ; (b) that Section 40 (5) enables tenants for life to grant settled land to a county council in perpetuity at a fee farm rent or other rent secured by condition of re-entry, or otherwise as may be agreed upon ; and (c) that Sub-section (4) of the same Section enables a sale to be made for the best rent-charge that can be reasonably obtained, having regard to the purpose for which the land is purchased, and to all the circumstances of the case.

5. I am also to point out that the Sailors and Soldiers (Gifts for Land Settlement) Act, 1916, empowers the Board, or a County Council, to accept and administer gifts for the settlement of ex-sailors and soldiers on the land.

6. Mr. Prothero much regrets the limitations that existing circumstances have imposed on the provision of land for the settlement of sailors and soldiers both through county councils and in connection with schemes under the direct supervision of the State, but he is confident that while the provision of capital for the purchase of land from Government funds is likely to be impracticable both during the War and for some time after the conclusion of peace, yet he is satisfied that much can be done with the active co-operation of the County Councils and that many landowners will be found ready to provide land on the terms available.

7. There is evidence that landowners all over the country are genuinely anxious to help the returned sailor or soldier, and although they might hesitate to take upon themselves the immediate risks inherent in a settlement policy, yet they would be willing either to grant a long lease or to sell in exchange for a perpetual rent-charge based on the capital value of the land.

8. I am, therefore, to invite your Council to co-operate with the Board in obtaining land that will be available for settlement purposes as men come to be discharged from the Services. The Board will be able to send an officer to confer with your Council as to the schemes that may most conveniently be adopted for the purpose, but as a preliminary step Mr. Prothero suggests that an inquiry should be instituted among the principal landowners in your county as to the land they may be prepared to offer under either of the Acts referred to above. Inquiry should be also directed as to the existence of glebe or land belonging to charities suitable for settlement which could, it is believed, in many cases readily be exchanged for a rent-charge in the manner contemplated by the Act. The Board would be glad to receive at an early date a schedule of any land so offered, together with any preliminary suggestions as to the scheme proposed for its utilisation.

9. Mr. Prothero will be glad to learn that your Council are prepared to assist in the manner indicated, and having in view the importance and urgency of the question he would suggest that a Committee of the Council should be specially charged with the matter. The Small Holdings and Allotments Committee may be the most suitable body to entrust with the work, in view of the experience gained in the administration of the Small Holdings and Allotments Act, 1908, and their knowledge of the conditions essential to the success of small holdings under varying local conditions, or it may prove more desirable to set up a special committee for the purpose.

10. I am further to suggest that as no reliable estimate is available at present of the number of ex-Service men who are desirous of adopting agriculture as a means of livelihood after the War, a preliminary inquiry should be made by your Council amongst the soldiers working on farms in your county. Some counties have already adopted that course, with the result that several applications have been received from men possessed of the capital and experience necessary to enable a holding to be worked successfully. I am to enclose a form of return* which the Board suggest would be suitable for the purpose and which the Board are about to have distributed throughout His Majesty's Forces with a view to ascertain, as far as possible, the probable extent of the actual demand for land and of the localities in which it is desired.

11. With regard to the question of equipment, the Board have power under the Small Holding Colonies Acts to let or manage the land or improve the same by the erection of buildings or otherwise; and as regards the Sailors and Soldiers (Gifts for Land Settlement) Act, all expenses incurred by the Board or the Council in relation to any gift are to be defrayed out of the trust property or the proceeds or income thereof, or out of money borrowed on the security of the trust property. It is probable, therefore, that no difficulty will arise in connection with the equipment of land acquired under those Acts.

12. The embargo on borrowing still remains so far as land to be acquired under the Small Holdings and Allotments Act, 1908, is con-

cerned, but it is hoped that arrangements may be made under which loans for the equipment if not for the purchase of land may be obtained.

13. With regard to the size of the blocks of land for settlement purposes, Mr. Prothero feels that no hard and fast rule can be laid down in that respect. It may be found necessary to provide comparatively large blocks of land of, say, 1,000 acres or more for men who have been resident in the towns—settlers who require the initiation into farming and guidance that can be provided by a colony and for those who are prepared to move from their own locality. There will, however, be a large number of men who will desire to settle in the districts in which they were born and bred and in which, probably, their families have lived for generations. Such men may be set up on comparatively small blocks of land, and even in cottages with not more than half an acre of land attached. Again, some parishes may desire to provide a War memorial, and for that purpose it is hoped that residents may come forward to give the land and that the parish will be willing to raise the funds required for the necessary houses and buildings. It may be possible to initiate a county scheme on such lines. It is evident, therefore, that a considerable amount of elasticity must be allowed, and that schemes for land settlement may take the form of scattered small holdings of a few acres, or of gardens up to half an acre of land attached to suitable cottages, or of colonies covering a wide area.

14. The Board are in constant touch with the Office of Woods, who manage the Crown Lands, and with the Ecclesiastical Commissioners. These Departments for several years past have acquainted the Board with any change of tenancy which is in prospect, in order to give the Board an opportunity of considering the suitability of the land for small holdings. The Board are about to circularise the universities, and colleges, the trustees of charities and similar public bodies, who hold property in land, inviting them to adopt the same procedure. By one or other of these means it is hoped that sufficient land may be acquired to meet all definite demands for settlement immediately on demobilisation. As further demands may be anticipated it will be necessary at the same time to obtain information as to the further land that can be made available to meet possible calls. Mr. Prothero is confident that the Board may count on the assistance both of individuals and corporations in their endeavour to set up a national scheme for providing land for the returned sailor or soldier.

I am, etc.,

(Signed)

A. D. HALL,
Secretary.

THE following Memorandum (No. C.L. 133/L. 1) was addressed to Agricultural Executive Committees by the Food Production Department of the Board on 17th September :—

**Agricultural
Exemptions.**

It has been agreed between the Food Production Department of the Board of Agriculture and Fisheries, the Local Government Board, and the Minister of National Service, that men engaged in the occupations specified below shall be, in future, entitled to be protected from military service as stated in this Memorandum.

1. Men principally and usually engaged throughout the year in the following occupations shall be held to be included in one or other of the items of the Schedule to the Agricultural Exemptions Order, dated

28th May, 1918, provided that they were so occupied at that date. These men will accordingly be entitled to receive vouchers from Agricultural Executive Committees and should not be dealt with on occupational grounds by Tribunals. It has been agreed with the Local Government Board that if cases of any of these men come before Tribunals, National Service representatives should inform the latter of this agreement.

- (a) Rabbit-catchers, rat and mole-catchers, vermin-killers.
- (b) Hedgers, ditchers and drainers.
- (c) Men wholly employed on individual agricultural estates in the following occupations :—

Agricultural masons, bricklayers, carpenters, joiners, slaters, and men engaged in fencing or in making walls or gates.

- (d) Men engaged in looking after machinery for pumping-stations, etc., on agricultural estates.

- (e) Sheep-dippers, shearers, and drovers.

- (f) Men wholly engaged in willow farming and withy growing.

- (g) Managers of sets of threshing-tackle.

- (h) Men engaged in flax cultivation.

- (i) Auctioneers and valuers who are at present engaged as land and estate agents, whose services are considered by the Agricultural Executive Committee as being essential for the purpose of carrying on work connected with agriculture and food production.

2. Agricultural vouchers issued to men wholly engaged in the breeding of horses, whether heavy or light, will not be objected to by National Service representatives.

3. The following classes will not be entitled to agricultural vouchers, and any vouchers which have been issued to them should be withdrawn :—

(a) *Estate Foresters and Woodmen.*—With regard to these men the Food Production Department is to submit to the Director-General of Recruiting a proposal for the inclusion of certain estate foresters and woodmen of definite ages and grades in the new certified occupation list. (Since the date of the agreement these men have been included in the new list of certified occupations, advance proofs of which are in the hands of Regions).

(b) *Private Gardeners.*—These men will be dealt with by way of separate instructions.

(c) *Men Engaged in Lime Burning for Agricultural Purposes.*—With regard to these men, the Food Production Department will submit lists of firms engaged in lime burning for agricultural purposes to the Ministry of National Service and the Trade Exemptions Department will consider what instructions should be issued in the case of such men as are not within the certified occupation list.

(d) *Poultry Farmers.*—These men will be dealt with by tribunals only.

(e) *Milk Recorders, Nicotine Producers, Members of Agricultural Wages Board and Sack Contractors.*—The Food Production Department will refer the cases of the small number of men employed in these occupations to the Ministry, which will deal with them by way of special instructions.

(f) *Heads of Departments and Exports in Retail Seed Firms.*—The Food Production Department will submit to the Ministry a further list of men engaged by these firms which will be sent to all Regions and which will supplement lists already sent.

4. In future, agricultural vouchers to men employed in agriculture who are members of Agricultural Executive Committees may be granted by Agricultural Executive Committees on the recommendation of the District Commissioner of the Board of Agriculture in agreement with the Regional Director of National Service.

THE following Memorandum (No. C.L. 134/L.1) was addressed to Agricultural Executive Committees by the Food Production Department of the Board on 17th September :—

Exemption of Kitchen Gardeners. The following copy of an instruction which has been issued to Tribunals is forwarded for your information and guidance.

1. The attention of Tribunals is drawn to the importance as a part of the general policy of food production, of maintaining the kitchen gardens of private households.

Exemption should generally not be refused to an experienced kitchen gardener whose exemption is found to be essential for the production of large quantities of necessary food supplies. Before, however, granting exemption in any case, the Tribunals should satisfy themselves (a) that the principal and usual occupation of the man is, and has been for a considerable time, that of a kitchen gardener, (b) that most of his time is spent in raising necessary food supplies, and (c) that, unless he is of low medical grade, a suitable substitute could not be obtained for him or, with effort, other arrangements could not be made for the essential part of his work.

If a man is engaged partly on kitchen gardening and partly on other work which is not of national importance, exemption should, where reasonable, be granted on condition that, in addition to his ordinary work as a kitchen gardener, he devotes a specified time to other essential work, particularly, where opportunity offers, to other kitchen gardening or agriculture.

The above recommendations do not apply to men who cultivate gardens or allotments in their spare time.

2. In some cases agricultural vouchers have been mistakenly given to men engaged in kitchen gardening. Any application for the exemption of a man from whom an agricultural voucher so given has been withdrawn should be entertained, although made out of time. Assistant-directors of National Service have been instructed to give any necessary consent in such cases.

As explained in R.207,* market gardeners are entitled to be granted agricultural vouchers on occupational grounds, and this memorandum does not apply to them.

THE following Army Council Instruction (No. 998 of 1918) was issued by the War Office on 7th September :—

**Withdrawal
of Category A Men
from Agricultural
Companies.**

1. Recent medical inspections show that there are a number of category A men serving in agricultural companies, and it has accordingly been decided (subject to the exceptions shown in paragraph 2) to withdraw them, in England and Wales, after 15th September, 1918, and in Scotland after 15th October, 1918, for military duty whenever they can be replaced by soldiers of a lower category.

* See this *Journal*, July, 1918, p. 474.

2. Those who are employed as tractor-drivers, blacksmiths, farriers, wheelwrights, steam-plough drivers, threshing-engine drivers, and feeders will not be withdrawn for the present.

3. Soldiers, who are eligible, will continue to be posted to agricultural companies, but those sent out for farm work on or after 1st August will be counted as substitutes for a corresponding number of A men who will be withdrawn after the 15th September and 15th October, as mentioned in paragraph 1. It should, therefore, be made clear to employers that it may be necessary to move men elsewhere later on.

4. The arrangements for withdrawing the A men will be carried out between the County Agricultural Executive Committees in England and Wales, Sub-Commissioners in Scotland, and the Commandants of Agricultural Distribution Centres.

5. As far as possible, trained or partly-trained soldiers will be selected for withdrawal in priority to others, but due consideration will be given to the inconvenience which may be occasioned if certain men are taken from their present employment sooner than is absolutely necessary.

6. The Agricultural Executive Committees may decide that, in some cases, it is not necessary to replace a category A man withdrawn from a farm, in which case they will be free to allot the lower category man, supplied as a substitute, to any other farm which is in need of labour.

7. If at any time there are no further A men on the strength of the companies at a centre, a report will be made to the War Office through Command Headquarters, so that instructions may be issued for the disposal of the substitutes who would be sent there.

8. A careful record will be kept with each company of the number of A men withdrawn, and how each man is disposed of. They will be transferred, under orders issued by Command Headquarters, to the arm of the Service for which they are most suited.

9. As A men can only be withdrawn as lower category men become available, it is most important that all experienced farm labourers now serving in units at home in a lower category than A should be transferred to the Labour Corps, and posted to Agricultural Companies. The only exceptions are B (i) men who are fully-trained Infantry men, and men in technical corps more usefully employed at a trade from which they cannot be relieved, and which would be of no value in agriculture.

10. It may be possible in certain instances to withdraw category A men before 15th September, but this will only be done with the consent of the County Agricultural Executive Committee.

ACCORDING to a Memorandum (No. C.J.L. 137, L.2), dated 23rd September, 1918, addressed to Agricultural Executive Committees by the Food Production Department of the Board,

**Payment of Soldier
Labour.**

it has been necessary, in view of the decisions of the Agricultural Wages Board, to amend the conditions regarding the payment of soldiers engaged on agricultural work to provide for a minimum cash payment of 12s. 6d. per week, and the payment of overtime at the new rates.

The farmer will have the same right of appeal to the District Wages Committee to pay a lower wage as in the case of his civilian employees,

THE Food Production Department announce that they have recently received numerous applications from fruit-growers and fruit growers' associations relative to planting "top" fruit trees, such as apples, pears, plums, and cherries. In these cases the applicant is referred to the Agricultural Executive Committee of the county in which his land is situated. The Department suggests that no objection should be raised to planting fruit of this nature, provided the area is not excessive and provided that in the case of arable land it is intercropped with a vegetable or root crop other than rhubarb, celery, asparagus, or seakale.

Nothing should be done to discourage an extension of the fruit industry in view of the fact that (where intercropping is practised) no reduction in the supply of food is involved, while the opportunity is also given to fruit growers to establish themselves before foreign competition recommences.

AN Order (No. 1039), dated 21st August, 1918, has been made by the Food Controller to the following effect:—

<p>The Potatoes (Registration of Wholesale Dealers) Order, 1918, as Amended by an Order of the Food Controller, No. 623: General Licence.</p>	<p>Notwithstanding anything contained in the Potatoes (Registration of Wholesale Dealers) Order, 1918,* the Food Controller hereby authorises every person holding a certificate of registration as a wholesale dealer in seed potatoes under the Potatoes Order, 1917,† to sell such potatoes by wholesale in accordance with the terms of such certificate until the 1st November, 1918.</p>
--	--

SOME misapprehension has arisen as to the intention of the Potatoes (1918 Crop) (Restriction) Order,‡ which prohibits sales of potatoes (other than first early varieties) for delivery on and after the 1st November except under the licence of the Food Controller. The Ministry of Food announce that licences will be granted freely to registered wholesale dealers to purchase potatoes in the ground and that sales of potatoes in the ground by or on behalf of the grower may proceed subject to the purchaser obtaining the necessary licence. These licences will be granted subject to the following conditions:—

- (a) The purchaser will be deemed to be the grower of the potatoes for the purpose of any Order issued in relation to the 1918 potato crop, and
- (b) The purchaser must not make any claim for compensation in respect of such potatoes if he subsequently incurs loss through the action of the Ministry of Food in prescribing maximum prices for potatoes or any general cancellation of contracts. Applications for licences should be made

* Printed in this *Journal*, July, 1918, p. 483.

† Printed in this *Journal*, October, 1917, p. 765.

‡ Printed in this *Journal*, August, 1918, p. 740.

to the Director of Vegetable Supplies, 100, Cromwell Road, London, S.W. 7, and should state the name and situation of the farm or holding on which the potatoes have been grown and the acreage and varieties of potatoes which the applicant has agreed to purchase.

AN Order (No. 1082), dated 31st August, 1918, has been made by the Food Controller, providing that a person shall not sell or offer or

**The Vegetable Marrow
Order, 1918.**

expose for sale or buy or offer to buy any vegetable marrows at prices exceeding the maximum prices under the Order. The Order fixes maximum prices both for wholesale and retail sales.*

THE attention of farmers in England and Wales is drawn by the Food Production Department of the Board to the fact that when selling wheat, barley, oats, rye, clover seed,

**The Testing of Seeds
Order: Selling Cereals
and Grass Seeds for
Sowing.**

etc., to other farmers for sowing it is necessary, under the Testing of Seeds Order, 1918, that these should be tested and that the required declaration should be made in writing to the purchaser at or before the time of sale or delivery. In the case of cereal seeds, however, it is sufficient, by virtue of a general licence recently issued by the Board of Agriculture and Fisheries, for the declaration to be delivered to the purchaser within one month of the sale or delivery, and not necessarily at or before the date on which this is effected.

In the case of wheat, barley, oats, and rye, the declaration must state :—

- (1) The name and address of the seller.
- (2) The variety.
- (3) The percentage of germination (if the germination is at or above the standards set out in the Order, viz., wheat and barley 90 per cent., oats 85 per cent., rye 80 per cent., a statement to that effect is sufficient, but if below these standards the actual percentage must be declared).
- (4) The date of the germination test (unless made within six months of sale).

No declaration need be made in respect of the purity of cereals.

The germination test may be made by the farmer himself, or by a private testing station, or by the Official Seed Testing Station, 72, Victoria Street, London, S.W. 1.

Farmers may sell seeds wholesale to a merchant as "seeds as grown," in which case only a declaration as to variety is required.

Particulars as to the declaration needed in the case of sales of other kinds of scheduled seeds and of the regulations with regard to the Official Seed Testing Station are given in Food Production Leaflet No. 47, copies of which may be obtained free of charge on application to the Board of Agriculture, 3, St. James's Square, London, S.W. 1.

* See prices on pp. 909-14 of this *Journal*.

THE following Notice was issued by the Food Production Department of the Board towards the end of September :—

Samples for Seed Testing.

Farmers who intend to avail themselves of the Seed Testing Station for the purpose of having their cereals and other seeds tested are urgently requested to send sufficiently large samples for the purpose. In the case of wheat, oats, barley, and rye, not less than 4 oz. should be sent. It causes great delay at the Station when samples that are too small are sent, as these have to be returned and larger samples asked for ; this also causes disappointment to the sender, inasmuch as it adds to the time that must elapse before a report can be prepared. If several samples are forwarded, farmers must also clearly label each package with a reference by which the samples can be identified when the reports are sent out. No time should be lost in sending samples forward to the Station immediately after threshing, and it is hoped that all wheat samples will have come to hand by the middle of November at the latest. Farmers can obtain envelopes for the purpose of sending samples to the Station on making application to the Food Production Department, 72, Victoria Street, London, S.W.1. As to fees, see p. 871 of this *Journal*.

AN Order (No. 1223), dated 27th September, 1918, has been made by the Food Controller to the following effect :—

The Pig (Sales) Order, 1918.

1. *Restriction on Slaughter of Pigs.*—No person shall on or after the 20th October, 1918, slaughter any pig unless such pig has within 14 days immediately preceding the date of slaughter been bought and sold in a market in Great Britain in accordance with the provisions of this Order relating to the sale of pigs for slaughter.

The restriction on slaughter imposed by this Clause shall not apply to—

- (i.) Slaughter of a pig under the powers conferred by the Diseases of Animals Acts, 1894 to 1914, or any Order made thereunder.
- (ii.) Slaughter of a pig when such slaughter is authorised by an officer of the Board of Agriculture and Fisheries or the Board of Agriculture for Scotland.
- (iii.) Slaughter of a pig when such slaughter is immediately necessary or desirable on account of accidental injury to the animal or its illness or for any other exceptional reason or purpose.
- (iv.) Slaughter by a self-supplier wholly or mainly for the purpose of his supply.
- (v.) Slaughter of a pig when the sale of such pig for slaughter elsewhere than in a market is authorised by this Order or has been authorised by the Food Controller and has been made in accordance with directions given by or on behalf of the Food Controller.

Provided that (except where slaughter duly takes place in accordance with the provisions of sub-clause (v.) hereof) notice of such slaughter and such other particulars as may from time to time be required shall be given within seven days thereafter to the Food Control Committee for the district in which the owner of the pig at the time of slaughter is at such time residing.

2. *Pigs to be Sold in Markets.*—(a) No person shall on or after the 6th October, 1918, sell or buy or offer to sell or buy any pig for slaughter or any dead pig unless such pig is at the time of such sale or offer in a market.

(b) The restriction on sales imposed by this Clause shall not apply to —

- (i.) The sale of a pig by a small owner or by a person authorised in that behalf by the Food Controller where such sale is made in accordance with the directions given by or on behalf of the Food Controller.
- (ii.) The sale of a pig pursuant to directions given by an officer of the Board of Agriculture and Fisheries, or the Board of Agriculture for Scotland, where directions for the slaughter of the pig have been given by such officer and have been duly complied with.

3. *Conditions of Sale in Markets.*—On and after the 6th October, 1918, no live pig shall be sold in a market for slaughter and no dead pig shall be sold in a market except in accordance with the following provisions :—

- (a) The pig shall be sold only to a person who is authorised by the Food Controller to buy pigs on his behalf (hereinafter called a Government Buyer) ;
- (b) The maximum price on the occasion of a sale to a Government Buyer shall be :—

- (i.) Where a person sells any live pig otherwise than by dead weight, a sum calculated at the rate of 21s. per score of the live weight, less the sum of 2s. 6d. per pig ; and
- (ii.) where a person sells any live pig by dead weight or any dead pig a sum calculated at the rate of 28s. per score of the dead weight, if the offals are included in the sale, and at the rate of 26s. 9d. per score of the dead weight if the offals are not included in the sale, less in either case the sum of 2s. 6d. per pig.

Provided that the deduction of 2s. 6d. per pig shall not be made in the case of a pig weighing on sale 150 lb. live weight or less.

4. *Conditions of Sale elsewhere than in Markets.*—The provisions of Clause 3 hereof shall apply where a pig is sold for slaughter, or where a dead pig is sold elsewhere than in a market by a small owner or by a person (not being a small owner) authorised in that behalf in accordance with the provisions of Clause 2 (b), except that in the case of such a sale by a small owner the deduction of 2s. 6d. per pig shall not be made.

5. *Variation of Prices.*—The Food Controller may from time to time vary any or all of the prices specified in Clauses 3 and 4 hereof by notice under this Order.

6. *Ascertaining Live Weight.*—Where a live pig is sold for slaughter otherwise than by dead weight, its weight for the purpose of this Order shall be its weight as ascertained at the time of sale by the Live Stock Auctioneer engaged in the sale or the market authority in whose market the pig is sold, or as ascertained at any time after sale by a person authorised in that behalf by the Food Controller or a Food Committee ; or if not so ascertained its live weight at the place of slaughter.

7. *Ascertaining Dead Weight.*—For the purpose of ascertaining the dead weight of a pig the following rules shall apply : If the carcass of the pig be weighed less than two hours after slaughter the dead weight shall be the weight of the dressed carcass then ascertained with a deduction at the rate of 1 lb. in each completed 50 lb. or part thereof ; if it be weighed more than two hours but less than 12 hours after slaughter, the dead weight shall be the weight of the dressed carcass then ascertained with a deduction at the rate of 1 lb. in each completed 100 lb. thereof ; if it be weighed more than 12 hours after slaughter the dead weight shall be the weight of the dressed carcass then ascertained without any deduction whatsoever.

8. *Directions.*—(a) Any person authorised in that behalf by the Food Controller may give directions as to the sale, weighing, allocation, or delivery of any pig for slaughter or of any dead pig, and all persons concerned shall comply with such directions.

(b) Any person authorised in that behalf by the Food Controller may at any time determine whether a pig is fit for slaughter, and the determination of such person shall be conclusive upon the question whether a pig is fit for slaughter.

(c) Where the authorised person has determined that a pig in any market is fit for slaughter, or has given directions as to the sale, weighing, allocation or delivery of any pig, such pig shall not be moved from the market except with the permission of the authorised person.

9. *Limit of Weight.*—(a) No person shall sell or buy or offer to sell or buy for slaughter or shall slaughter any pig weighing at the time of sale or offer for sale or at the time of slaughter less than 112 lb. live weight.

(b) This Clause shall not apply to any sale or purchase for slaughter of a pig weighing less than 112 lb. weight, where slaughter is for any exceptional reason or purpose authorised by the Live Stock Commissioner or his representatives or by an officer of the Board of Agriculture and Fisheries or the Board of Agriculture for Scotland.

10. *Increasing Weight of Pigs.*—(a) A person shall not feed or water or otherwise treat any pig so as unduly to increase its weight at the time of sale.

(b) Where a Government Buyer has reasonable cause to suspect that a pig has been fed or watered or otherwise treated so as to unduly increase its weight at the time of sale, he may detain such pig for such time as he thinks fit before ascertaining its weight for the purposes of sale under the provisions of this Order.

11. *Prescribing Markets.*—(a) The Food Controller may at any time prescribe the market or markets in which any pigs shall be sold for slaughter, and no person shall thereafter send or cause to be sent such pigs for sale for slaughter to, or sell for slaughter such pigs in, any market other than such prescribed market or markets.

(b) A person shall not move any pigs fit for slaughter from one area to any other area without the permission of the Food Controller; provided that pigs fit for slaughter may be moved from one area to any other area without such permission—

(i.) if the lands and premises on which such pigs are ordinarily kept by the owner lie within more than one area and such pigs are moved only from one part of such lands and premises to another in the ordinary course; or

(ii.) if the owner of such pigs occupies other lands and premises situate in an area other than the area in which the pigs are ordinarily kept and the pigs in question are moved to such lands and premises, provided that in this case notice of such removal shall within 7 days thereof be given in writing to the Live Stock Commissioner for one or other of such areas.

12. *Records.*—Every person who in the course of his business buys any pigs for the purpose of his business shall keep accurate records showing the prices paid for such pigs and such other particulars as are necessary to show whether or not the provisions of this Order are being complied with, and shall make such returns as to his business as the Food Controller or a Food Committee may from time to time require. All such records and relevant documents shall be open to the inspection of any person authorised by the Food Controller or a Food Committee.

13. *Entry and Inspection.*—For the purpose of executing and enforcing this Order any officer of, or other person authorised by the Food Controller may enter into any slaughterhouse or other premises on which he suspects pigs are being or have been slaughtered and examine any animals or carcasses therein, and inspect and require production of any books or other documents relating to pigs slaughtered on such premises ; and no person shall impede or obstruct such officer or other person in the exercise of his powers under this Clause.

14. *Fictitious Transactions.*—A person shall not sell or offer or expose for sale or buy or agree to buy any pigs at a price exceeding the price applicable under this Order, or in connection with the sale or disposition or proposed sale or disposition of any pig enter or offer to enter into any artificial or fictitious transaction or make or demand any unreasonable charge.

15. *Infringements.*—Infringements of this Order are summary offences against the Defence of the Realm Regulations.

16. The Pigs (Prices) Order, 1918,* is revoked as regards England and Wales and Scotland, but without prejudice to any proceeding in respect of any contravention thereof.

17. *Interpretation.*—For the purposes of this Order "Pig" shall include boar and sow ; "Score" shall mean a weight of 20 lb. ; "Market" shall include market, fair, or such other place as the Food Controller shall from time to time authorise as a market for the purpose of this Order.

"Dressed Carcass" means the carcass of the pig without the offal and shall include the whole of the flail or leaf, the head, kidneys, skirtings, feet and skin. The carcass shall not be trimmed at the throat, ears and nose, except by the removal of the hair.

"Offals" includes plucks, chitterlings, liver, intestines, loose fats, hearts and lights.

"Self-supplier" means the owner of a pig at the time of slaughter who has owned it for not less than two calendar months immediately preceding the slaughter thereof and who is in possession of the land or premises where the pig has been kept during such period.

"Small Owner" means a person who sells for slaughter in any calendar year not more than three pigs owned by him.

A pig shall be deemed to have been bought or sold for slaughter if it be slaughtered within 14 days of the sale.

"Area" means in England and Wales the district of a Live Stock Commissioner, and in Scotland the district of a Deputy Live Stock Commissioner.

18. *Title and Extent.*—(a) This Order may be cited as the Pigs (Sales) Order, 1918.

(b) This Order shall not extend to Ireland.

THE Calves (Sales) Order, 1918 (No. 1036), dated 21st August, 1918, made by the Food Controller, introduced, as from 26th August, a new

The Calves (Sales) Order. system of control in regard to the sale and slaughter of calves. The Order places no restriction upon the sale of live calves, but a calf may be slaughtered only at a Government slaughter-house except in cases where slaughter elsewhere—for example, on a farm—is

authorised by the Food Controller. Calves brought to a Government slaughter-house will be bought by a Government buyer, and calves slaughtered elsewhere than at a Government slaughter-house, if intended for human consumption, must be sold only to a Government buyer. The addresses of Government slaughter-houses will be advertised in local newspapers.

In order that farmers and stock-breeders may have no doubts as to their position in the face of the probable rise in the price of meat, the

**Proposed Rise in the
Price of Meat: The
Farmer's Position.**

Ministry of Food announce that there will be no corresponding increase in the price payable to the farmer. The proposed increase is mainly due to the rise in the cost of imported meat and *partly to the need of spreading over the whole year the increased prices to be paid to the farmer during the winter months.* In the middle of May the Ministry of Food announced that the prices of cattle and sheep would be increased on a graduated scale in accordance with the following schedule, and there is no intention of modifying this arrangement :—

	Cattle per Live Weight.	Sheep per Head.
November, 1918	Nil.	1s.
December, 1918	1s.	2s.
January, 1919	3s.	3s.
February, 1919	4s.	4s.
March, April, May, 1919	5s.	5s.
June, 1919	5s.	3s.
July, August, September, October	Nil.	Nil.

A SERIOUS feature of the meat situation is presented by the Area Live Stock Commissioners, who report from many areas a considerable increase in the number of animals passing through the markets for slaughter. The

**Excessive Slaughtering
of Animals.**

farmer, now that harvest operations are over, is better provided with the labour necessary for forwarding stock, and fears the difficulty of feeding cattle during the winter, when the accustomed provision of concentrated food is uncertain and he must rely mainly on roots and home-grown food. Though the Ministry of Food fully realise the difficulty in which the farmer is placed, and are carefully reviewing the situation so that fodder requirements may as far as possible be met, they are bound to consider the position which may arise if cattle are slaughtered too freely early in the autumn.

Home-grown meat has assumed a greater importance than ever, since a further limitation on imports is imposed by the necessities of military transport, and it is therefore essential that stock should be conserved during the winter months. Accordingly the Food Controller has decided to reduce consumption by a general lowering of the ration, and simultaneously instructions have been issued to Government agents in the markets to secure that only cattle really finished shall be graded for slaughter. It is hoped that farmers generally will realise

that conservation of the herds is a matter of urgent national interest, and will avoid premature slaughter of their stock. (*National Food Journal*, 25th September, 1918.)

THE uncertainties attending the supply of feeding stuffs are responsible in some degree for the large numbers of cattle brought to market in the last few weeks, though the break in the weather and the comparative leisure following harvest have also influenced the situation.

**Feeding Stuffs for
Stocks: Detail of
Arrangements for
the Winter.**

Since Area Live Stock Commissioners are responsible generally for the maintenance of the herds of the country, and are in possession of detailed information with regard to stock on the farms, it has been decided to increase their responsibilities in respect of feeding stuffs distribution. They have been hitherto entrusted with the issue of priority certificates for feeding stuffs. In future a Feeding-Stuffs Sub-Commissioner will be attached to the staff of each Area Live Stock Commissioner, and applications from farmers will be dealt with at the Commissioner's office.

Dairy cattle in milk, calves under six months, bulls over six months kept for breeding, and horses engaged in agricultural work, sows in farrow, boars and store pigs will be strictly rationed as regards concentrated feeding stuffs. An extra ration is to be granted, under certain conditions, to stall-fed dairy cattle. The Live Stock Commissioners will issue certificates entitling the holders to purchase supplies, on a rationed basis, of cakes and meals, millers' offals and brewers' grain. Farmers will be tied to licensed dealers nominated by them—either to a separate dealer for each class of feeding stuff, or to a single dealer for two or more varieties.

At present it is not proposed to take into account the farmer's own supplies of oats, barley, roots, beans, and peas, though information under this head will have to be scheduled in case the situation should become so critical as to make it essential that farmers' home-grown supplies should be considered. It is proposed that farmers obtaining licences to feed tail and damaged grain shall have their allotments of cake reduced ton for ton.

At headquarters a Feeding-Stuffs Board has been set up, together with a main Allocation Committee composed of representatives of the Feeding Stuffs and Live Stock Sections of the Ministry of Food, together with representatives of the Boards of Agriculture and of the trades concerned, working in conjunction with the Joint Official Committee of the Board of Agriculture and the Food Ministry. Supplies will be allocated to each area in accordance with its ascertained needs, and will be allotted *pro rata* to dealers according to the certificates registered with them for delivery to farmers. It is proposed to decentralise as much of the work as possible to county officers working under the Sub-Commissioner for Feeding Stuffs in each county. These county officers will be, whenever possible, the existing secretaries of the Provincial Feeding Stuffs Committees.

The necessary machinery is being set up at once, and it is felt that the new procedure, if patriotically backed by the trade, will give the farmer the fair treatment he is entitled to expect, and help to conserve the nation's supplies. (*National Food Journal*, 9th October, 1918.)

IN view of the imperative necessity for reserving as much of total tonnage as possible for the transport of American troops and of their munitions and supplies, it is inevitable that during the coming winter feeding stuffs should be in short supply. The Ministry propose, however, to secure that such feeding stuffs as are available shall be fairly distributed among those requiring them, and that an effective preference shall be given to the more important classes of live stock, and especially to milch cows.

**Short Supply of
Feeding Stuff: Notice
to Stock Owners,
Licensed Dealers, and
Others.**

The scheme proposed will come into full operation on 17th November. After that date feeding stuffs will be distributed only to persons who have made applications in accordance with the scheme, and on the basis of a definite allowance per head for the various classes of live stock.* The application forms are as follows :—

Form L.F.S. 1 : For dairy cattle, calves, breeding bulls, agricultural horses, and pigs other than those owned by "small owners" and pig clubs.

Form L.F.S. 2 : For horses not engaged in agricultural work (e.g., horses used for trade purposes and pit-ponies).

Form L.F.S. 3 : For use by pig clubs.

Form L.F.S. 4 : For use by small owners who slaughter 3 pigs or less in one year and who are not members of pig clubs.

Copies of Forms L.F.S. 1, L.F.S. 2 and L.F.S. 4 should now be obtainable from licensed dealers in cattle feeding stuffs. The first two (L.F.S. 1 and L.F.S. 2) must be returned to the Live Stock Commissioner by 15th October.† The other (L.F.S. 4) must be returned by the same date to the dealer from whom the smaller owner of pigs wishes to purchase supplies.

Copies of Form L.F.S. 3 will be obtainable by secretaries of pig clubs from the Live Stock Commissioner, and must be returned to him. Members of pig clubs should apply to their secretaries. Any licensed dealer who does not receive the application form by Wednesday, 9th October (to-day), should apply for a supply to the Area Live Stock Commissioner for his area.

For the reasons stated, there is a very great scarcity of concentrated animal feeding stuffs; and persons who can manage without purchasing supplies, or who can manage with less than the maximum allowances, will be doing the country a service by refraining from making application, or by applying for reduced quantities. Every pound of concentrated feeding stuffs that can be saved is urgently required for providing for other classes of cattle.

Pending the setting up of the new organisation, arrangements are being made for supplies for cows in milk, calves under six months, agricultural horses, sows in farrow, store pigs and pit ponies. Owners should apply to their usual dealers for the proper forms on which to make application during this emergency period. Form C.F.S.E. 1 is required for supplies for animals for which priority certificates have been issued; C.F.S.E. 3 for the same classes of animals for which no certificates have yet been obtained. (*National Food Journal*, 9th October, 1918.)

* See p. 915.

† Date since extended to 22nd October.

AN Army Council Order, dated 20th August, 1918, as amended by a subsequent Order, dated 27th August, 1918, fixes the following maximum prices for hay and straw in the stack :—

Regulation of the	stack :—
Sale of Hay and Straw	Hay, per ton, £8.
and of Chopped Hay	Threshed hay, per ton, £5.
and Straw in	Oat straw, barley straw, pea straw, and
England and Wales.*	threshed tares, per ton, £3 15s.
	Wheat straw, rivett wheat straw, buck-
	wheat straw, and mustard straw, per ton, £3.

For 1917 or earlier crops the following are the maximum prices :—

Hay, per ton, £6 1s.

Threshed hay, per ton, £4 10s.

Oat straw, barley straw, bean straw, pea straw, and threshed tares, per ton, £3 6s.

Wheat straw, rivett wheat straw, buckwheat straw, and mustard straw, per ton, £2 15s.

The above prices in each case are for the best quality only ; inferior hay or straw will be graded according to quality. The prices in every case must include the cost of carting to the nearest railway station, or a distance equivalent thereto. Interest at the rate of 5 per cent. or 10 per cent. is added in certain cases.

All hay and straw sold for civilian purposes, whether to a wholesale dealer or retailer, will be invoiced to such wholesale dealer or retailer by the County Distributing (Forage) Committee of the County concerned at cost price at stack, plus buying and establishment charges.

The wholesale dealer may add the following charges :—

(a) For establishment charges, 5s. per ton.

(b) For cutting, trussing, and tying with string or baling with two or more wires, 16s. per ton.

(c) (1) The actual cost per ton incurred on any freight by rail, or (2) the actual cost of freight by water not exceeding such sum per ton per mile as the County Distributing (Forage) Committee is satisfied is the local rate ruling at the time of delivery ; (3) where conveyed wholly by road and not by rail or water, such sum per ton per mile in excess of the distance from stack to nearest railway station as the County Distributing (Forage) Committee is satisfied is the local rate ruling at the time of delivery.

(d) Where conveyed by rail or water, for loss of weight in transit, 5s. per ton.

(e) In the case of straw tied by hand in bundles with two strings or bands, instead of the sum mentioned in (b) above the sum of 14s. per ton.

(f) In the case of hay tied with hay or straw bands, instead of the sum mentioned in (b) above the sum of 10s. per ton.

(g) In the case of straw baled or bundled, with two or more wires or strings behind the threshing drum, instead of the sum mentioned in (b) above the sum of 10s. per ton.

* A Leaflet (No. 12) dealing with the situation as to hay and straw from the farmer's standpoint has been issued by the Joint Committee of the Board of Agriculture and the Ministry of Food. Copies may be obtained post free on application to the Secretary, Joint Committee, 6A, Dean's Yard, Westminster, S.W.1.

In addition to the above sums per ton a wholesale dealer who is also a distributor, or a distributing dealer or producer distributor, may add the following charges :—

- (a) For establishment charges and profit, 6s. per ton.
- (b) For road delivery charges from store or railhead to consumer's premises, such sum per ton per mile as the County Distributing (Forage) Committee is satisfied is the local rate ruling at the time of delivery.
- (c) All costs of storage by County Distributing (Forage) Committee.
- (d) All costs of storage on premises occupied by dealers, at rates approved by the County Distributing (Forage) Committee of the County in which such premises are situate. The price of rye straw shall be the same as the price of oat straw.

Manufacturers of chopped hay and straw may make an additional charge of £2 3s. 4d. per ton to cover all costs incidental to manufacture ; provided that where the consumer or purchaser supplies his own bags such charges shall be £1 10s. per ton.

Distributors may charge for quantities not exceeding 10 cwt. an additional sum of £1 6s. 8d. per ton, and provision is made for cases in which orders for more than 10 cwt. cannot be fulfilled in one delivery.

THE Controller of Horse Transport calls the attention of owners and users of horses to the revised Hay and Straw Order (No. 3, 1918), dated 25th September, 1918, issued by the

New Hay and Straw Order.

Board of Trade, which came into operation on the 1st October. Under the previous Order maximum daily rations of chaff were laid down for various classes of horses, the Order providing that chaff shall consist of not less than one-third of straw. Under the new Order the maximum rations in hay are prescribed, leaving horse owners to add as much straw-chaff as they desire. The principal rations are as under :—

Heavy dray and cart horses and heavy trotting vanners	13 lb. of hay per day.
Light dray and cart horses and light trotting vanners	10 " "
Other light horses and cobs	8 " "
Ponies 14 hands and under	7 " "

The increased production of straw this year also permits of the withdrawal of the prohibition against the use of straw for bedding horses except in the case of oat-straw, which must be kept for feeding purposes.

The increased demands upon the hay crop of the country through the shortage of other animal feeding-stuffs, and the calls of the Army, render it essential that the utmost economy should be exercised in the consumption of hay. Horse owners are therefore urged to make use of straw, roots, and other substitutes as far as they can do so consistently with the maintenance of the health and efficiency of their horses.

Correspondence with respect to the Order should be addressed to *The Controller of Horse Transport, 7, Whitehall Gardens, London, S.W.1.*

THE following Notice was issued by the Food Production Department of the Board towards the end of September :—

Hay and Straw. There appears to be some doubt among farmers as to their position with regard to their hay and straw. The Food Production Department therefore circulate the following statement: Stocks of hay and straw are nominally at the disposal of the Army Council and all farmers will be visited in due course by officers of the Forage Department, who will note what hay and straw is not required for use on the farm. These officers have been instructed to release liberally, but if any farmer is dissatisfied with the quantity released he can appeal to the Farm Produce County Committee, whose decision as to what he can retain will be final. This Committee is composed of farmers. Pending an inspection and the issue of a licence, a farmer may continue the reasonable use of his hay or straw for his stock.

There is, therefore, no reason to fear that farmers will not be left with sufficient hay or straw for their stock, but it is desirable that they should exercise the greatest possible economy in the use of hay, and they should to as large an extent as possible use straw instead of hay for feeding purposes.

THE following Notice was issued by the Food Production Department of the Board towards the end of September :—

Hay for Rabbits.—It is not necessary to use any sort of corn or meal for rabbits during winter, although it may be desirable to give breeding stock a little bran. Roughly, a rabbit needs daily food equal to about one-eighth of its own live weight. In winter a 6-lb. rabbit would need 10 oz. of green food or roots and 2 oz. of hay. Rabbit-keepers will be interested to learn that the Central Council of the Forage Department Civil Supplies allows 1 lb. of hay per week per rabbit—slightly above the actual requirement for a rabbit of medium size—and that this quantity can be obtained by consumers registered with any licensed dealer. The National Utility Rabbit Association is informed that farmers in various places have refused to sell hay to rabbit-keepers because they were not clear as to the regulations on the subject. The Association has, therefore, obtained this ruling from the Central Council.

ANY owner of dairy cows, breeding sows, or young pigs who has not already applied to the Live Stock Commissioner of his area for a priority certificate entitling him to millers'

Millers' Offals :

Priority Certificates.

offals should at once do so. Up to the present time a very large percentage of such offals has undoubtedly been distributed to persons not possessing priority certificates; but the Ministry is tightening control of these feeding-stuffs, and millers are served with a notice that they are to supply offals only to certificate holders, unless and until these have received the quantities to which their certificates entitle them. This emergency measure should go a long way to assure stock-owners that, however limited the quantity of offals may be, they will receive their share. A Rationing Order is being prepared for every class of stock, but the completion of this Order must wait until the amount of tonnage to be allocated for imported feeding-stuffs by the Maritime Council is definitely known. Meanwhile, it may be well to correct a mistaken impression as to the quantity of cake stored

by the Government, which has been mentioned at as high a figure as 450,000 tons. It is rather less than 60,000 tons, of which under 20,000 tons is cotton cake.—(*National Food Journal*, 11th September, 1918.)

THE following Notice was issued by the Joint Committee of the Board of Agriculture and the Ministry of Food towards the end of September :—

Silage : A Farmer's Solution.

In view of the interest aroused amongst farmers as to the future possibilities of silage as a permanent feature of English agriculture, the experience of one of our correspondents, as given in the following letter, should prove of value. Not the least interesting fact is that the stack system of ensiling crops adopted by him requires but little expenditure of capital. The letter is as follows :—

" I have been making silage from sewage irrigated Italian rye-grass for many years past. As a rule I commence cutting rye-grass in May and continue until the middle of June, when we try to make it into hay if the weather is favourable, but, if wet, we continue making silage. Silos are not used, but silage stacks on the Johnson's system of pressure by means of cast-iron drums on which are wound flexible wire-strand ropes passed over the rick. The rye-grass is best left with one or two days' interval, according to state of grass and weather, between cutting and stacking, so that the succulent grass may part with some of its moisture before stacking. It is best, if the amount of crops is sufficient to justify it, to have two stacks in use and load each on alternate days; then the necessary heat will be generated and it will not be necessary to put on the ropes, except to stand over Sunday, when the stacks are half-built or three-parts, or much heat generated. The wire ropes should be put on and tightened twice daily until the stacking is resumed. The grass is not chaffed, of course, and is fed in winter to young cattle, in-calf heifers and cows and horses, all of which eat it readily. It is more important the stacks or silos should be most convenient and near to the fields in which the crops for silage are proposed to be grown, as the haulage of this heavy crop for silage is a big consideration at a busy time of the year.

" P.S.—The silage can readily be hauled to the stock in the winter when work is not so pressing, and in case sour silage is made it is best some distance from dwelling-houses. I prefer sweet silage, though live stock will eat either equally well. Another advantage is, it is not affected with frost, and will keep good for two or more years."

THE following Notice was issued by the Food Production Department of the Board in September :—

Bracken for Litter.

In view of the present restrictions on the use and sale of straw, it is hoped that owners of land on which bracken is grown, who do not require the bracken for their own use, and conservators of commons, will offer every facility in their power for the removal of bracken by those who require litter for their stock.

In cases where grubbing up is resorted to, it should be remembered that the roots are readily eaten by pigs. A leaflet on Bracken as Litter can be obtained free of charge and post free on application to the Secretary, Board of Agriculture and Fisheries, 3, St. James's Square, S.W. 1.

THE following Notice was issued by the Food Production Department of the Board towards the end of September :—

The practice of using young shoots of gorse for the feeding of cattle and horses was at one time common in many parts of this country.

It is still followed in some districts, and might, under present circumstances, be considerably extended. Gorse is in many ways an excellent winter food for certain classes of stock, and might be largely made use of with straw, of which there will be much more than usual to consume during the coming winter. Generally gorse is used from October to the beginning of the New Year. The usual method is to cut daily what is required for use, and then to pass the gorse through a gorse-chopper, or even an ordinary chaff-cutter. After this it is mixed with chopped straw roughly in the proportion of from one-third to one-half by bulk. Special gorse-choppers are often used in places where gorse is regularly fed, but an old-fashioned chaff-cutter, with slanting knives fixed on a drum (which is the principle on which gorse-choppers are made) will answer the purpose well. An ordinary strong chaff-cutter, if set to cut short, will also serve. Gorse is not generally considered useful for young stock, but is certainly of great value for horses, and especially cows.

AN Order (No. 1165), dated 17th September, 1918, has been made by the Food Controller to the effect that :—

The Milk (Winter Prices) Order, 1918.

1. No person shall directly or indirectly sell or offer for sale or buy or offer to buy any milk at prices exceeding the maximum prices provided by or in pursuance of this Order.
2. Until otherwise determined pursuant to this Order the maximum price applicable on the occasion of a retail sale of milk shall be :
 - (a) For milk delivered on and after the 1st October up to and including the 21st November, 1918, at the rate of 3s. per imperial gallon, for milk delivered on and after the 22nd November, 1918, up to and including the 30th April, 1919, at the rate of 3s. 4d. per imperial gallon.
 - (b) Where at the request of the buyer the milk is required to be delivered in bottles and is so delivered to the buyer's premises an addition may be made to the foregoing prices at the rate of 1d. per quart, provided the milk is bottled under proper sanitary conditions at or before reaching the seller's premises.
 - (c) The foregoing prices shall include all charges for delivery, but it shall be permissible for a Food Committee for any area, from time to time subject to the provisions of this Order, by resolution to fix for all or any of the milk sold within their area and not delivered to the purchaser's premises a rate different from the rate for the time being applicable to milk which is so delivered, provided that no such resolution shall have effect until sanctioned by the Food Controller.
3. (a) Where milk is sold wholesale by or on behalf of the producer the maximum price chargeable for milk delivered on and after the 1st October, 1918, up to and including the 30th April, 1919, shall be at the rate of 2s. 3d. per imperial gallon, together with a sum equal to the net amount of the charges for railway transport actually incurred by the seller.

(b) The rate applicable under Sub-clause (a) of this Clause is fixed on the basis that the milk is delivered at the seller's expense to the buyer's premises or (at the option of the seller) to the buyer's railway station, and that in the latter case all charges for transport beyond the buyer's railway station are borne by the buyer. Where milk is not sold on this basis a corresponding adjustment shall be made in the rate, and for this purpose the cost of delivery to the buyer's premises or carriage to the seller's railway station shall be reckoned at a sum not less than $\frac{1}{2}d.$ per gallon.

(c) No additional charges may be made for the provision of churns or other vessels.

4. Where milk is sold wholesale by or on behalf of any person other than the producer the maximum prices chargeable shall, until otherwise determined pursuant to this Order, be as follows :

(a) In the case of milk delivered by the producer to or for the account of the buyer in accordance with the directions of the seller the rate shall, until the end of April, 1919, be $\frac{1}{2}d.$ per imperial gallon higher than the price chargeable to the seller by the producer.

(b) In the case of milk not so delivered, the rate shall be—

(i.) When delivery is made by the seller to the buyer's railway station 2s. 5d. per imperial gallon, together with the railway charges paid by the seller for carriage from the seller's station to the buyer's station.

(ii.) When delivery is made by the seller to the buyer's premises at the rate of 2s. 7 $\frac{1}{2}d.$ per imperial gallon.

(c) The rates mentioned in Sub-clause (b) are fixed upon the basis that the cost of providing churns or other vessels is borne by the seller ; and where milk is not sold on this basis, then the rate shall be ascertained by deducting from the rate applicable under such Sub-clause the sum of $\frac{1}{4}d.$ per imperial gallon.

(d) Except in the cases to which Sub-clause (a) of this Clause applies no milk shall be sold wholesale by or on behalf of a person other than the producer of the milk sold except upon the terms that the milk is to be delivered by or at the expense of the seller to the buyer's premises or the buyer's railway station.

5. A Food Committee may, from time to time by resolution passed at any time after the date of this Order, vary the maximum price applicable on a retail sale for milk delivered within their area or any part of such area but :

(a) Every such resolution shall be reported to the Food Controller within five days and shall not take effect until three days after the same has been sanctioned by the Food Controller, and

(b) Every resolution of a Food Committee under this Clause shall be subject at any time to review by the Food Controller and shall be withdrawn or varied as he may direct.

6. (a) Where milk is sold to an establishment as herein defined by any person (whether he be the producer of the milk sold or not) in a quantity of not less than 17 imperial gallons to be delivered in any one day the maximum price (including charges for delivery to the buyer's premises) shall be, whichever shall be the lower of the following prices, namely :

- (i.) 2d. per imperial gallon higher than the maximum price chargeable in the district in which the establishment is situate for milk delivered to the buyer's premises on a sale by wholesale by a person other than a producer ; or
 - (ii.) the maximum retail price for the time being in force in such district.
- (b) Any other sale to an establishment shall for the purposes of this Order be deemed to be a retail sale, and the maximum price shall be determined accordingly.
- (c) "An establishment" for the purposes of this Order shall mean a public or private hospital, sanatorium, convalescent or nursing home, workhouse, infirmary, asylum, corporation or company not established for purposes of trading or profit, a religious or charitable community, a residential school or college, and a canteen.
- (d) A Food Committee shall have power with the consent of the Food Controller—
- (i.) to apply the provisions of this Clause, whether with or without modifications, to a sale of milk to any body of persons which, in the opinion of the Committee, should be treated as an establishment ;
 - (ii.) to vary the provisions of this Clause in its application to any establishment.
7. Where a person who sells milk from a retail shop sells from such shop milk to a person buying for re-sale, the maximum price shall, as to the milk sold on any day, be 2d. per gallon less than the maximum price applicable to sales of milk by retail in the area in which such shop is situate, if the quantity sold on that day to such person does not exceed 8 imperial gallons.
8. No milk shall be sold or offered for sale by retail otherwise than by imperial measure, except that nothing in this Clause shall prevent :
- (a) Sales of milk by the pennyworth or two pennyworth ; or
 - (b) Sales of any fraction of a gill, pint, quart, or gallon of milk ;
- Provided that the maximum price is not exceeded.
9. No colouring matter shall be added to milk or cream intended for sale, and no milk or cream to which any colouring matter has been added shall knowingly be sold, or offered or exposed for sale.
10. No water shall be added to milk intended for sale, and no milk to which any water has been added shall knowingly be sold, or offered or exposed for sale.
11. No person may use for the purpose of his trade or business any milk-can, milk-churn or milk-bottle which bears the name or trade name or the trade mark or trade device of some person other than himself or his employer, except with the consent of such person.
12. No person shall, in connection with the sale or disposition or proposed sale or disposition of any milk, enter or offer to enter into any fictitious or artificial transaction or make or demand any unreasonable charge.
13. A Food Committee may, subject to the consent of the Food Controller—
- (a) buy milk from any person and sell milk so bought at a price estimated to cover at least the cost of purchasing and distributing such milk ; and

- (b) make arrangements as to the distribution of milk in their area.

14. (a) A Food Committee may—

- (i.) direct any person delivering milk by retail in their area to deliver such milk to any consumer or class of consumers in priority to any other person in their area ; and
- (ii.) direct any person selling milk by retail within their area to deliver in that area only within such parts thereof as the Committee may prescribe ; and
- (iii.) with the consent of the Food Controller give directions in their area for securing the purity, cleanliness and wholesomeness of milk, provided that any directions so given shall not relieve local authorities of their powers and duties under existing statutory provisions in regard to milk or relieve cow-keepers, dairymen, purveyors of milk or occupiers of milk shops from their obligations under any such provisions.

(b) Every person to whom any direction is given under the powers conferred by this Clause shall comply with such directions.

(c) A Food Committee may, with the consent of the Food Controller, exercise the powers conferred by Sub-clause (a) (i.) of this Clause in respect of condensed milk, dried milk and milk preparations.

15. A Food Committee shall not, without the consent of the local authority or authorities by whom they were appointed, exercise the powers conferred upon them by the two immediately preceding Clauses in such manner as may involve an expense which is ultimately to be borne by such authority or authorities, provided that the validity of any direction given by a Food Committee under any such powers shall not be questionable on the ground that such consent has not been obtained.

16. Where any contract subsisting on the 1st October, 1918, for the sale of milk provides for the payment of a price in excess of the maximum price fixed by this Order applicable on the occasion of such a sale, the contract, unless otherwise determined by the Food Controller, shall be avoided so far as concerns milk which is to be delivered on or after that date.

17. (a) The provisions of this Order relating to prices shall not apply to milk sold for consumption on the premises of the seller :

(b) Except as provided by Clause 14, nothing in this Order shall apply to condensed milk, dried milk or milk preparations.

18. For the purpose of this Order :

“ Food Committee ” shall mean a Committee appointed in pursuance of the Food Control Committees (Constitution) Order, 1917.

“ Buyer’s Premises ” shall not include any roadside collecting place for milk or any other premises which the Food Controller shall in any particular case determine not to be buyer’s premises for the purposes of this Order.

“ Buyer’s Railway Station ” shall mean the railway station to which in the ordinary course of business the milk would be consigned by the seller to the buyer or, in cases to which Clause 4 (a) applies, to the buyer’s purchaser.

19. The Milk (Summer Prices) Order, 1918,* and the general licence granted thereunder and the Milk (Summer Prices) Amendment Order, 1918,† are hereby revoked as on the date when this Order comes into force, but without prejudice to any proceedings in respect of any previous contravention thereof

Note.—This Order came into force on the 1st October, 1918, and does not extend to Ireland.

AN Order (No. 1232), dated 30th September, 1918, has been made by the Food Controller to the effect that :—

1. Sub-clause 4 (b) (ii.) of the Principal Order Amending the Order‡ shall be deleted and the following Milk (Winter Prices) Sub-clause shall be substituted therefor :—
Order, 1918. (ii.) Where delivery is made by the seller to the buyer's premises a rate in accordance with the following table :—

<i>Period of Delivery.</i>	<i>Rate per Imperial Gal.</i>	
	<i>s.</i>	<i>d.</i>
After the 30th September, 1918, and before the 8th October, 1918	2	7½
After the 7th October, 1918, and before the 22nd November, 1918	2	6
After the 21st November, 1918, and before the 17th December, 1918	2	7½
After the 16th December, 1918, and before the 1st May, 1919	2	8

AN Order (No. 1246), dated 5th October, 1918, has been made by the Food Controller, providing that the Food Controller or any person authorised by him in that behalf may from time to time issue directions relating to the collection, allocation, distribution or treatment of milk, and in particular may—

- (i.) fix the proportion or amount of milk which may be retained by a producer for the purpose of his wholesale or retail trade, or for any other purpose ;
- (ii.) fix the maximum quantity of milk which may be acquired by any person in any period and the persons from whom milk may be acquired by him ;
- (iii.) direct that any producer or dealer in milk shall sell or deliver the whole or any part of his milk to any person or place ;
- (iv.) restrict or regulate the sale or delivery of milk by any person to any other person or to any place ; and
- (v.) fix the maximum amount of liquid milk which any person may use in any period for any manufacturing purpose.

* Printed in this *Journal*, April, 1918, p. 110.

† Printed in this *Journal*, July, 1918, p. 491.

‡ See p. 894.

THE Food Council have had under consideration the supply and distribution of milk during the coming winter, and the Food Controller, on their advice, has decided to give immediate effect to recommendations made to him by the Sub-Committee of the Astor Committee

Winter Milk. which reported earlier in the year.* With this end in view, Orders have been made giving the Food Controller the necessary powers to direct producers and traders as to the disposal of liquid milk, whether for the purposes of manufacturing cheese, butter, condensed milk, and other milk products, or for direct consumption as liquid milk.

The first of these Orders,† the Milk (Distribution) Order, 1918, enables the Ministry of Food to give the necessary instructions to producers and dealers with regard to the person or persons to whom the milk shall be delivered, etc., and the purposes for which it may be used. The second Order‡ provides for the taking over, under Clause 2GG of the Defence of the Realm Regulations, of the premises of milk factories and milk wholesalers. These Orders do not apply to Ireland.

The issue of these Orders does not involve any immediate alteration in the present channels of distribution, and those concerned are being instructed to proceed as usual until definite instructions are received. In the meantime, Assistant Milk Commissioners are being appointed in each division to act under the instructions of the Food Commissioners.

These officers will survey the situation as regards production and requirements in their areas, and will thus be able to advise the Ministry of the measures that are necessary to secure the preservation of supplies, the prevention of waste and a fair distribution to consumers.

The Ministry of Food will have the advice of a Central Advisory Milk Committee on which consumers, dairy farmers, the wholesale trade, and retail organisations, together with the Government Departments concerned, will be represented. Steps are under consideration for a measure of devolution for Scotland. (*National Food Journal*, 9th October, 1918.)

AN Order (No. 1140), dated 13th September, 1918, made by the Food Controller, prescribes as follows:—

The Eggs (Licensing of Wholesale Dealers and Distribution) Order, 1918. A person shall not deal in eggs by wholesale either on his own account or as agent on commission:—

- (a) After the 28th September, 1918, unless he has applied for a licence as a wholesale dealer in eggs; or
- (b) after the 2nd November, 1918, unless he is the holder of a licence for the time being in force granted by the Food Controller authorising him to deal in eggs by wholesale.

Every application for a licence shall be made to the Secretary, Ministry of Food (Eggs Supplies Branch), 100, Cromwell Road, S.W. 7, on the form appropriate to such application.

Nothing in the Order shall apply to (a) a person selling eggs laid by his own birds; (b) eggs for breeding purposes; or (c) canned, dried or desiccated eggs or egg products.

The Order does not apply to Ireland.

* See this *Journal*, July, 1918, p. 452.

† Printed above, p. 898.

‡ Order, No. 1245, dated 5th October, 1918. Not printed in this *Journal*.

THE Ministry of Food have had under consideration for some time past the question of the egg supply during the coming winter. Their arrangements have progressed so far and so

Supply of Eggs. successfully that, in spite of the enhanced difficulties in the way of securing poultry food, transport, and distribution, the public are already practically assured of a supply at any rate equal to last winter's, and at prices which will not by any means reach the fabulous sums that rumour has invented. The first step in the Ministry's policy was to ensure that a reasonable price should be asked of the consumer, whose interests it is the primary duty of the Food Controller to protect. Next it was necessary to arrange a clear definition between grades of eggs—fresh, imported, and preserved. Thirdly, there was the problem of methods of distribution. On the latter point it may be observed that existing channels will not be interfered with to any greater degree than is necessary, in order to secure equality for all, the big towns in industrial districts will have their supplies on a parity with home-producing rural districts.

In regard to quality, the responsible officials now have before them the possibility of instituting three grades, which may be stated tentatively as (1) eggs other than imported and preserved eggs weighing over 1½ oz.; (2) imported and preserved eggs over that weight; and (3) all eggs less than that weight, with a form of schedule which can be varied from time to time. A decision will be reached almost immediately as to whether some such system of grading is practicable. In the matter of price—the question which most nearly affects the consumer—arrangements have been made whereby at least 50 per cent. of the egg supply in the winter months will become the property of the Ministry. These eggs will come from Ireland, Egypt, Denmark, Canada, and America. Although at the present moment the price at which they will reach the breakfast table cannot be stated, they will be comparatively cheap, according to their quality. The remainder of the country's supplies will be brought into line under an Order of the Food Controller to be issued in due course. (*National Food Journal*, 11th September, 1918.)

AN Order (No. 1084), dated 30th August, 1918, has been made by the Food Controller to the effect that:—

**Order Amending the
Poultry and Game
(Prices) Order, 1918.**

The Poultry and Game (Prices) Order, 1918* (hereinafter called the Principal Order), shall be amended as follows:—

1. The Schedule to this Order shall on and after the 30th August, 1918, until further notice be substituted for the Schedule to the Principal Order.

2. After Sub-clause (iv.) of Clause 4 of the Principal Order there shall be inserted the following Sub-clause:

“(v.) A person may sell poultry or game otherwise than by weight provided that the maximum price is not exceeded, and provided he weighs the poultry or game at the time of sale if so required by the buyer.”

3. After Clause 11 of the Principal Order there shall be inserted the following Clause:

“11A. Nothing in this Order shall apply to sales of cooked poultry or game by a caterer in the ordinary course of his catering business.”

THE SCHEDULE.
Maximum Prices for Poultry and Game.

	First Column.		Second Column.	
	Price at the Rate per lb.	Price for the Bird.	Price at the Rate per lb.	Price for the Bird.
	<i>s. d.</i>	<i>s. d.</i>	<i>s. d.</i>	<i>s. d.</i>

ANY person buying poultry mixture who thinks that the ingredients include dirt, stones and worthless rubbish, or that the price is in excess of what he should be charged, can send a

Poultry Mixtures: complaint to the proper quarter. The procedure to follow is to report the matter to the Local Food Office—not to the Ministry of Food—addressing it to the "Grain Officer" and enclosing a sample of the mixture and all the necessary particulars.

NUMEROUS statements having recently appeared in the Press announcing that farmers are able to obtain higher prices for damaged than for sound grain, the Ministry of Food

Price of Damaged Grain.

consider it necessary to point out that such statements are unauthorised and contrary to facts.

The Grain Prices Order, 1918,* clearly lays down that the maximum prices at which damaged wheat, rye, and barley may be sold are 7s. per qr. below the maximum prices fixed for sound wheat, rye and barley for the same period of sale; in the case of oats improperly cleaned or containing an undue quantity of soil the maximum price is 5s. per qr. less than the maximum for sound oats. (*National Food Journal*, 9th October, 1918.)

* See this *Journal*, September, 1918, p. 742.

THE following Notice was issued by the Food Production Department of the Board in September :—

Owing to the unfavourable season in certain districts, many stocks of bees are weak and very short of food.

Feeding Bees for Over-Wintering.

Bee-keepers are therefore recommended to inspect their stocks immediately. Those which are weak and have less than five seams of bees should be united to form strong colonies of not less than eight seams, and all those which are short of food should have a quantity of syrup fed to them for immediate storage in the combs. This syrup can be made by dissolving each 1 lb. cake of candy in 10 oz. of water by heating over the fire.

At the present time, the manufacturers of this candy, Messrs. Jas. Pascalls, Limited, Blackfriars Road, London, S.E., are receiving large numbers of orders from bee-keepers, who are apparently ordering sufficient supplies not only for autumn feeding, but to last throughout the winter—spring. The supply of candy so far available may prove insufficient for both purposes, and as a result many bee-keepers, especially those who have nucleus stocks, may be unable to obtain any for immediate use.

This candy has been manufactured solely to supply present demands, and under these circumstances bee-keepers should obtain just now only those supplies necessary for immediate syrup feeding. The candy required for winter and spring feeding should be ordered at a later date.

Any further information on bee-keeping may be obtained free on application to the Food Production Department, 72, Victoria Street, S.W. 1.

ACCORDING to a Notice issued by the Food Production Department of the Board towards the end of September, interest in bee-keeping is stated to be reviving rapidly. This is due no

The Bee Outlook: doubt to the decreasing virulence of the Isle of Wight disease. This latter fact seems to be

clearly established by expert inspections of apiaries in Gloucestershire, Nottinghamshire, Herefordshire, Leicestershire, Glamorganshire, and other counties made recently on behalf of the Food Production Department, which in this matter is acting in close co-operation with the British Bee-Keepers' Association. Bee-keepers will be glad to hear that experiments made during the past three years suggest the possibility of the production at an early date of a strain of bee in this country practically immune against the Isle of Wight disease. The importance of the bee to the fruit grower is more widely recognised at the present time than it has been in the past, and many inquiries have been received from growers for healthy stocks.

The Food Production Department have issued a timely warning to bee-keepers to pay attention to the food supply in the hives. This should be augmented where necessary. Each stock brought through the winter means a considerable addition to our food supply next year in the form of both honey and fruit.

Many bee keepers have patriotically increased their colonies for distribution to those anxious to keep bees but who find a difficulty in obtaining stock. Owing to the unfavourable season in certain districts,

these nuclei and late swarms will need attention if they are to survive the winter. The Food Production Department have compiled instructions on "Building Nuclei into Strong Stocks for Over-wintering" which will be found invaluable to bee-keepers*; these instructions, and any further information on bee-keeping, may be obtained free on application to the Food Production Department, 72, Victoria Street, S.W. 1

THE following Notice was issued by the Food Production Department of the Board early in October:—

Bunt in Wheat. It is evident from the reports which have been received from inspectors of the Food Production Department, and from the results of examining samples of seed wheat in the Seed Testing Station, that much of the wheat which will be used for seed purposes this season is contaminated with "bunt."

The presence of unbroken bunted grains in a sample of wheat is readily recognisable, and the careful farmer either rejects it as seed wheat or takes due precautions to render the bunt harmless before sowing. These bunted grains are readily blown out during winnowing; some of the bunted grains break open and the black, powdery mass of spores they contain becomes distributed over the sound corn. If they are present in abundance the tips and the grooves of the sound grains are blackened; if they are few in number no discoloration results, and the sample appears to be bunt-free. Nevertheless, practically every grain of it may carry a few of the microscopic spores of the bunt fungus; and it is a certainty that a considerable proportion will, when sown, give rise to bunted plants.

It is often impossible to determine without a microscopic examination whether a sample intended for sowing is bunt-free or otherwise. No seed should be sown unless from previous knowledge of the crop one can be perfectly sure of its freedom from contamination, or it has been dressed with some preparation capable of killing the adherent bunt spores.

For this purpose solutions of either sulphate of copper or formaldehyde (generally known as formalin) are especially satisfactory. Various dressings used for the purpose of keeping birds and vermin away from the seed are often considered to be efficient bunt destroyers. But, in view of the fact that numbers of severe outbreaks of bunt have been seen in wheat fields sown with seed so treated, their use cannot be recommended.

The copper sulphate solution is made up by dissolving 1 lb. of sulphate of copper in 10 gal. of water: the formalin solution by pouring 1 pint of formalin into 20 gal. of water.

The heap of seed grain may be "watered" with either of these solutions and stirred repeatedly during the process to ensure the thorough wetting of every grain; or the seed may be poured into vessels containing the solution and allowed to steep for an hour or two. The latter method has the advantage that bunted grains can be skimmed off when they rise to the surface.

* See article on p. 368.

THE existence of foot-and-mouth disease amongst animals on premises at Burwash, East Sussex, was confirmed on 26th September.

**Foot-and-Mouth
Disease.**

The usual precautions were taken to prevent the spread of the disease, and an Order was made prohibiting the movement of animals in a large area surrounding the infected farm.

Two further outbreaks have since occurred on farms practically adjoining the original infected place, one on 1st October, and the second on 9th October. Certain modifications of the restrictions on movement have been made as regards the parts of the scheduled district more remote from the infected places.

The Department of Agriculture and Technical Instruction for Ireland announced on 27th September that they had disallowed, until further notice, the landing in Ireland of all cattle, sheep, and other ruminants and swine, from Great Britain, and had, by Order taking instant effect, prohibited the landing from that country of all hay and straw, except straw used in packing merchandise, manufactured straw not intended for use as litter for animals, and hay or straw being imported for exclusively military purposes under the certificate of a competent military authority. They announced that they were also taking the customary steps to secure the disinfection on landing in Ireland of persons who have been in contact with animals in Great Britain, and that Scotland had been included in the scope of these precautions pending further information as to the extent of the outbreak.

The Government Secretary, Government Office, Isle of Man, also notified the Board on 27th September that permits for the importation into the Isle of Man from Great Britain of cattle, sheep, swine, and goats were being temporarily withheld pending further information as to there being any likelihood of the disease spreading; and an Order was issued by the Committee of Piers and Harbours, Jersey, on 28th September, prohibiting, until further notice, the landing in Jersey of cattle and hay, straw, seed and other forage from Great Britain.

A CASE of rabies on a dog at Plymouth was confirmed by the Board of Agriculture and Fisheries early in September, and several other cases

Rabies.*

that are suspicious have been reported and are under investigation. In view of these circumstances, and the fact that it is known that in many instances persons have been bitten by diseased and suspected dogs, the Board have made Orders prohibiting the movement of dogs out of the counties of Devon and Cornwall, and requiring the muzzling and control of dogs within a large area of those two counties.

The Board have also made an Order empowering them to issue licences for the movement of dogs out of the Cornwall and Devon area. Such licences will require the detention and isolation of the dogs on the premises of a veterinary surgeon approved by the Board for a period of four calendar months at the expense of the owner of the dog. Applications for licences should be addressed to the Secretary, Board of Agriculture and Fisheries, 4, Whitehall Place, S.W. 1.

Orders have also been issued by the Department of Agriculture and Technical Instruction for Ireland, and the Isle of Man Government, temporarily prohibiting the importation of dogs from Great Britain.

The public are warned that any case in which symptoms suspicious of rabies are observed should at once be notified to the police.

* See also later note on p. 914.

UNDER the Corn Production Act the Agricultural Wages Board, in addition to fixing minimum cash wages for agricultural workers, is empowered to define certain payments in kind —termed in the Act “benefits or advantages” —which may be reckoned in part payment of such wages. Remuneration for service in this form has been common from time immemorial in most parts of the country under the name of “allowances,” “privileges,” “perquisites,” etc., but they have hitherto been reckoned as supplementary to the cash wage, and as additional payments regulated by custom or by special arrangements with individual workers. The establishment of a legal minimum wage, however, entitles the worker to receive the whole amount in cash, unless, by agreement with his employer, he receives part payment of the amount in one or other of the forms authorised by the Wages Board. The Board have now made an Order (see below), defining the particular “benefits and advantages” which may be legally reckoned as part payment of wages, and also determining the method in which their value for this purpose is to be ascertained. The Order lays down that where an employer supplies a worker with milk or potatoes, or provides him with a cottage or with board and lodging, he may deduct from the minimum wage in respect of these “benefits or advantages” a sum representing their cash value to the worker, as calculated in accordance with the terms of the Order. In respect of a cottage provided by an employer, the Order names the maximum amount (three shillings) which may under any circumstances be deducted from the cash wage, and under certain conditions this maximum may be reduced by the District Wages Committee for the area. Milk and potatoes are to be valued at the current producers’ wholesale prices, *i.e.*, the farm price, not including cost of delivery. The value of board and lodging (“living in”), or of meals, is to be fixed in each area by the District Wages Committee, who are to have regard to current prices of commodities, and also to the amounts charged under existing contracts for employment. The decisions of the District Committees in these matters have to be reported to the Wages Board for confirmation and publication.

Customary allowances or privileges, which are not included in this Order, cannot now be reckoned in part payment of wages, although they may, of course, be continued by the employer as additions to the minimum wage, or be made the subject of mutual agreement between master and man. (*Wages Board Gazette*, 14th September, 1918.)

AN Order, dated 6th September, 1918, has been made by the Agricultural Wages Board to the following effect:—

**Order as to Benefits
and Advantages which
may be Reckoned
as Payment of Wages
in Lieu of
Payment in Cash.**

1. The benefits or advantages which may be reckoned as payment of wages in lieu of payment in cash for the purpose of any minimum rate of wages which may be fixed under the above Act are hereby defined to include the provision by an employer for a workman employed by him of—

- (1) Milk, including skimmed or separated milk.
- (2) Potatoes.

- (3) Lodging, except in any case in which the District Wages Committee shall determine that the lodging accommodation provided is so defective as to be injurious to health.
 - (4) Board, including any meals, but not including intoxicating drink.
 - (5) A cottage, including any garden hitherto given or let with the cottage, except where the cottage is one in regard to which the Medical Officer of Health has reported that it is in a state so dangerous or injurious to health as to be unfit for human habitation.
2. The values at which the said benefits or advantages are to be reckoned for the purpose aforesaid are hereby defined to be—
- (1) In the case of milk the current producers' wholesale price (to be ascertained and determined by the District Wages Committee as hereinafter provided).
 - (2) In the case of potatoes the current producers' wholesale price (to be ascertained and determined by the District Wages Committee as hereinafter provided) at the time at which the main crop of potatoes is lifted.

Provided that where any payment is made by the workman for the provision of the milk or potatoes an equivalent deduction shall be made from the value at which the benefit or advantage is to be reckoned.

- (3) In the case of lodging such weekly sum as the District Wages Committee shall determine.
- (4) In the case of board such weekly sum as the District Wages Committee shall determine.
- (5) In the case of a cottage, three shillings per week less any rent or rates which may be paid by the occupier, and so that the said value shall in no case exceed three shillings per week.

Provided that this definition of the value of the provision of a cottage shall not apply—

- (a) To cottages in the area of a District Wages Committee or in any defined part thereof, when the said committee shall have determined that the average value customarily attached to cottages occupied by workmen employed in agriculture and free from defects of accommodation, repair, or sanitation (including water supply) in that area or part is less than three shillings, and in that case the value at which the provision of a cottage may be reckoned as payment of wages in lieu of payment in cash shall be such less sum as the said committee shall determine; or
- (b) To a cottage with regard to which the District Wages Committee on an application by or on behalf of the workman shall at any time
 - (i.) Certify that the cottage is defective by reason of inadequate accommodation, want of repair, or sanitation (including water supply), and is of less value than a cottage which is free from such defects; and
 - (ii.) Determine the amount by which the value of the cottage occupied is less than the value of such a cottage, and in that case the value at which the provision of the cottage may be reckoned as payment of wages in lieu of payment in cash shall not exceed three shillings a

week less the amount so determined by the committee, and also less any rent and rates which may be paid by the occupier.

3. (1) Subject to and for the purposes of this Order every District Wages Committee shall from time to time in respect of their area or any defined part of their area—
 - (a) Ascertain and determine the current producers' wholesale prices of milk and potatoes, and
 - (b) Determine the amounts of the weekly sums at which the values of the provision of lodging and board are to be reckoned.
- (2) In determining the amounts of the said weekly sums a District Wages Committee may specify sums varying according to the character of the lodging accommodation and meals provided, and shall have regard to the current prices within their area or the defined part thereof of articles included in such accommodation and meals and to the normal or average values at which under current contracts for employment in agriculture within such area or part such accommodation and meals appear to be reckoned.
4. Every determination of a District Wages Committee under this Order shall be reported as soon as may be to the Agricultural Wages Board who may vary such determination in any case, and shall publish or notify the same (including such variation, if any) in such manner as they think fit with a view to bringing the same so far as practicable to the knowledge of the persons affected thereby.
5. (1) In this Order the expression "District Wages Committee" means any District Wages Committee established under the District Wages Committee's Regulations, 1918.
- (2) Any power or duty of a District Wages Committee under this Order may be delegated to a sub-committee or sub-committees thereof subject to the provisions of Clause 18 of the District Wages Committees' Regulations, 1918.
6. Except as in this Order provided no benefit or advantage shall be reckoned as payment of wages in lieu of payment in cash for the purposes of any minimum rate of wages fixed under the Corn Production Act, 1917.
7. This Order shall come into operation on the 9th day of September, 1918.

A PROGRAMME of cinematograph films was shown to an audience of officers of the Board of Agriculture, Ministry of Information and the War Aims Committee, at the Ministry of Information, on 4th September. The films were a selection of those which had been acquired by the Board during the last six months, mainly for the purpose of exhibition by means of the War Aims Committee's cinemotors, which will travel in specified country districts during the coming autumn, winter and spring, for the purpose of exhibiting interesting and instructive Government films. These cinemotors have been specially designed to enable films to be projected out-of-doors on a blank wall of almost any kind of building, as well as in halls and similar places,

and it will be possible, therefore, to give exhibitions in almost any country town or village. The Committee is arranging its programme so as to give agriculture a prominent place, and the films shown at the Exhibition on 4th September, together with others not yet completed, will form the catalogue from which the cinemotor agricultural programme will be made up. The programme shown on 4th September comprised the following films:—

- " Mr. Robert Mond's Farm at Sundridge, Kent."
- " Tractor Farming in America."
- " Parasitic Mange in Horses."
- " Cheese-making on a Small Holding."
- " Celery-growing in Florida."
- " Oxford Rally of the Women's Land Army."
- " Fruit-tree Grafting at Mr. W. W. Berry's Farm in Kent."
- " Women Flax Harvesters at Sherborne."
- " Hay-baling by Government Machinery."
- " The Ilford Part-time Workers."

Other films are:—

- " The Women's Land Army."
- " Women's Test Meeting at Warrington."
- " Helping the Food Controller at Bournville."
- " Women's Land Army Rallies in London."
- " Women Farmers of Great Britain."
- " Co-operative Cheese-making."

In the provision of these films the Board have received very valuable assistance from the officials of the Cinematograph Department of the Ministry of Information, without whose expert advice and help it would have been impossible for them to have undertaken the preparation of some of them. The cinema promises to be a useful aid to agricultural education in the future.

Part III. of Agricultural Statistics for 1917, dealing with prices and supplies of corn, live stock and other agricultural produce in England

**Prices and Supplies
of Agricultural
Produce.**

and Wales in 1917, has now been issued (Cd. 9163, 1918). Copies may be obtained direct, or through any bookseller, from H.M. Stationery Office, Imperial House, Kingsway, London, W.C. 2, price 3d. net, excluding postage.

In his report which prefaces the tables in this part, Sir Henry Rew arrives at 214 as the general index number of prices of produce sold off the farm in England and Wales in 1917, the average prices from 1906-8 being taken as the basal prices (=100). The index number in 1916 was 178, so that the prices increased 20 per cent. in 1917 over 1916. Representing the average prices of farm produce in 1906-8 as 100, the prices in 1917 are given as follows: Cattle 227, milk 203, sheep 190, pigs 252, hay 184, wheat 232, barley 228, potatoes 223, poultry and eggs 193, fruit 168, wool 194, butter 186, oats 257, cheese 214, beans and peas 284, vegetables 297. It may be explained, however, that the calculation of annual index numbers has necessarily been disturbed by the exceptional conditions of the times and the practical suspension of free markets for nearly all the staple articles.

THE following is a list of Retail and Wholesale Maximum Prices of certain agricultural commodities fixed by Maximum Retail and the Food Controller (extracted from recent Wholesale Prices. issues of the *National Food Journal*)—

RETAIL MAXIMUM PRICES.

Butter—

Government Butter	2s. 6d. per lb.
British-made Butter	2s 4d. "

Cheese—

Government Cheese (imported British-made and Caerphilly) (including Dutch)	1s. 8d. "
British Cheese, not controlled in distribution by Government, an addition to actual cost to the Retailer, as defined by the British Cheese Order, not exceeding ..	2½d. "

Damaged Grain, Seeds, and Pulse—

For quantities not exceeding 7½ qr., add to traders' prices	4s. per qr.
For quantities of less than half a qr.	8s. "

Milk—

(Winter prices, subject to variation by local Committees with the sanction of the Food Controller)—

1st October to 21st November, 1918	3s. 0d. per imp. gal.
22nd November, 1918, to 30th April, 1919	3s. 4d. , "

Poultry and Game—

	Price at the Rate per lb. s. d.	Price for the Bird. s. d.
Cockerel, pul et, cock or hen—		
Weighing 6 lb. or less	2 8	—
" more than 6 lb.	—	16 0
Domestic duck—		
Weighing 6 lb. or less	2 3	—
" more than 6 lb.	—	13 6
Turkey	2 8	—
Goose	1 8	—
Guinea fowl	—	7 0
Grouse and black game, young birds (hatched in 1918 and sold prior to 1st November, 1918)	—	5 6
All other grouse and black game	—	3 3
Partridges, young birds (hatched in 1918 and sold prior to 1st January, 1919)	—	4 0
All other partridges	—	2 3
Pheasants (cocks)	—	7 0
Pheasants (hens)	—	6 6

Poultry Mixtures or Horse Corn Mixtures—

Profits permitted on cost price—

More than 6 cwt.	1s. per cwt.
Less than 6 cwt. and not less than 3 cwt.	3s. "
" 3 " " " ½ "	4s. "
" ½ " " " " "	½d. per lb.

Horse Chaff Mixtures—

1 ton or more	1s. per cwt.
Less than 1 ton and not less than 5 cwt.	2s. "
Less than 5 cwt. and not less than ½ cwt.	3s. "
Less than ½ cwt.	1s. per 14 lb.

Rabbits, Wild 9½d. per lb.

Vegetable Marrows 1d. per lb.

No marrow may be sold at a higher price than 7d.

WHOLESALE MAXIMUM PRICES.**Butter—**

<i>Government Butter.</i>		Per lb.
		s. d.
In bulk, delivered	2 3
In rolls, etc., of 1 lb. or less, delivered	2 3½
<i>British-made Butter.</i>		
(a) When sold by a wholesaler—		
In bulk, delivered	2 1
In rolls, etc., of 1 lb. or less, delivered	2 1½
(b) When sold by the producer to a retailer—		
In bulk, <i>ex</i> creamery, factory or farm	2 1
In rolls, etc., of 1 lb. or less, <i>ex</i> creamery, factory or farm	2 1½
(c) When sold by the producer to a wholesaler—		
In bulk, <i>ex</i> creamery, factory or farm	1 11½
In rolls, etc., of 1 lb. or less, <i>ex</i> creamery, factory or farm	2 0½

Cheese—

Maximum first-hand prices for delivery—

On and after
9th Aug. until
further notice.
Per lb.

	s. d.
Caerphilly, whole milk	1 6½
" partially skimmed— <i>i.e.</i> , containing at least 25 per cent. of fat in the dry matter	1 5
" wholly skimmed— <i>i.e.</i> , containing less than 25 per cent. of fat in the dry matter	0 11
Any whole milk cheese not exceeding 2 lb. weight uncut, other than Caerphilly	1 10
Maximum first-hand prices for cheese manufactured—	
Ripened Stilton and Wensleydale (blue)	1 10
Dorset, hand-skimmed (blue)	1 4½
" separated (blue)	1 0½
" " (white)	0 11
All other whole milk cheese	1 8
" partially skimmed cheese— <i>i.e.</i> , cheese containing at least 25 per cent. of fat in the dry matter	1 2½
" wholly skimmed cheese— <i>i.e.</i> , cheese containing less than 25 per cent. of fat in the dry matter	0 11
In all cases prices are <i>ex</i> factory or <i>ex</i> farm.	

Grain—

Date of Sale of Grain sold.	Wheat and Rye per qr. of 504 lb.	Barley per qr. of 448 lb.	Oats per qr. of 336 lb.
	s. d.	s. d.	s. d.
Where sale is made before 1st October, 1918, the price shall not exceed	75 6	67 0	47 6
Where sale is made in October, 1918, the price shall not exceed	75 6	67 0	48 0
Where sale is made in November, 1918, the price shall not exceed	75 6	67 0	48 6
Where sale is made in December, 1918, the price shall not exceed	75 6	67 0	49 0
Where sale is made in January, 1919, the price shall not exceed	76 0	67 0	49 6
Where sale is made in February, 1919, the price shall not exceed	76 0	67 0	50 0
Where sale is made in March, 1919, the price shall not exceed	76 0	67 0	50 6
Where sale is made in April, 1919, the price shall not exceed	76 6	67 0	51 0
Where sale is made in May, 1919, the price shall not exceed	76 6	67 0	51 6
Where sale is made on or after the 1st June, 1919, the price shall not exceed	76 6	67 0	52 0

The prices are increased by 1s. per qr. where the grain is carried, without railway transport, direct from producer's premises to mill or factory for the purpose of manufacture.

On a purchase of oats suitable for the manufacture of oatmeal or other oats products for human food by a manufacturer specifically for the purpose of such manufacture, or by a recognised dealer in fulfilment of a specific order given in writing by such manufacturer for such purpose, the maximum price is the standard rate plus 3s. per qr.

The maximum prices of wheat, rye and barley so damaged as to be unfit for use in the manufacture of human food and of tailings, dressings and screenings which are unfit for such use are 7s. per qr. less than the standard rate.

The maximum price of oats improperly cleaned or containing an undue quantity of soil, and of oats tailings and dressings, is 5s. per qr. less than the standard rate.

On purchase of grain from a recognised dealer who is not the producer of the grain sold the maximum price is the standard rate plus 1s. per qr. ; or for a quantity not exceeding $7\frac{1}{2}$ qr. sold to one buyer in any period of seven consecutive days including the day of sale, the standard rate plus 5s. per qr. ; or for a quantity of less than half a qr. the standard rate plus 9s. per qr.

Payment in all cases to be net cash within seven days of completion of delivery, and moneys then unpaid to carry interest thereafter not exceeding the rate of 5 per cent. per annum or bank rate, whichever shall be the higher.

The grain to be delivered free on rail or barge, or to mill or store in accordance with the usual custom of the district, and any freight, haulage, portorage and cartage subsequently incurred shall be for the buyer's account.

All sack hire up to and including the time of delivery to rail, barge, mill or store by the producer to be for the producer's account, and all charges for sacks subsequent thereto to be for the buyer's account.

Where grain is sold on terms and conditions other than these terms and conditions a corresponding adjustment is to be made in the maximum price. In particular : (a) Where grain is delivered by the producer to a distance greater than the distance corresponding with the usual custom of the district, a sum at the rate of 9d. per ton per mile for the extra distance shall be added to the maximum price. (b) Where delivered by the producer at his premises, a sum at the rate of 9d. per ton per mile for the distance corresponding with the usual custom of the district shall be deducted from the maximum price. (c) Where any home-grown grain has been mechanically treated by gisting, crushing, bruising, kibbling, splitting or other kindred process, or has been kiln-dried or dried by other mechanical method, the maximum price is to be ascertained by adding to the price otherwise applicable according to the provisions of the Order, the cost of such treatment not exceeding a usual and reasonable charge.

Damaged Grain, Seeds, and Pulse—

Imported feed wheat	72s. per 480 lb.
Damaged imported wheat	65s. " "
" " rye	65s. " "
" " maize	65s. " "
" " and home-grown pulse and seeds (other than oil seeds) used for feeding purposes	65s. " "
" " barley	55s. " 448 lb.
" " oats	41s. " 336 "

Milk—(Winter Prices for Great Britain)—

Producers' price for delivery to buyer's premises or railway station—

October, 1918, to April, 1919, inclusive .. 2s. 3d. per imp. gal.

Together with railway charges (if any) paid by the producer for carriage to the buyer's railway station.

Wholesale dealer's price for delivery to buyer's railway station—

October, 1918, to April, 1919, inclusive .. 2s. 5d. per imp. gal.

Together with railway charges paid by the seller for carriage from seller's to buyer's station.

Wholesale dealer's price for delivery to buyer's premises—

October, 1918, to April, 1919, inclusive .. 2s. 7½d. per imp. gal.

Vegetable Marrows—cont.

On a sale to a person who declares in writing that he is buying for the purpose of sale by retail, price <i>ex</i> market or (at the seller's option) delivered to buyer's premises	£6 10s. per ton.
On sales to any other person, price <i>f.o.r.</i> , ship, or barge, at grower's station, port, or wharf ..	£5 10s. "
Price for any person but the Grower— <i>Ex</i> market or (at the seller's option) delivered to buyer's premises	£6 10s. "

**Prosecutions of
Farmers, etc., under
Statutory Rules and
Orders.**

Barking.—James Soper, Low Hall Farm, Chingford, on sales of adulterated milk, £10.

Brentford.—Arthur Brown, farmer, Hounslow, on sales of watered milk, £20. (*National Food Journal*, 25th September, 1918.)

THE following Notice was issued by the Board on 11th October :—
On the 7th of September a case of rabies was detected in a dog at Plymouth.

**Further Notice as
to Rabies.**

There is every reason to believe that this disease had existed unrecognised in this district for some weeks or even months earlier.

Twenty-two further cases have since been discovered by the officers of the Board of Agriculture and Fisheries and many other suspected cases are under investigation.

There is grave risk of the spread of this most dangerous disease unless the public co-operate with the police and the officials of the Board of Agriculture in securing the observance of the Regulations and giving information. The district between St. Blazey, Cornwall, and the Avon River, Devon, must be considered as the specially dangerous area.

No person travelling into Devon or Cornwall should take a dog with him at the present time. The dog may contract rabies; it must wear a muzzle while in the area and it cannot be moved out of these counties except to licensed veterinary premises where it will be isolated and detained for four months.

It is known that a number of dogs were moved out of the area before the Orders restricting movement came into force. Owners are warned of the grave risk that both they themselves and the public run from such dogs being at large. They should at once acquaint the Board of Agriculture and arrange for the removal of the dog to veterinary premises. The incubation period of rabies varies between twelve days and many months, the disease often develops suddenly, and incalculable harm may be wrought before a "mad dog" can be destroyed.

**Supply of
Concentrated Feeding
Stuffs: General
Rationing Scheme.**

In reference to the scheme of distribution of feeding stuffs which will come into operation on 17th November (as stated at page 889), the general scale of rations covering the ten-weeks' period from 17th November to 25th January next is as follows :—

<i>Class of Live Stock.</i>	<i>Maximum Allowances per Head for Ten-weeks' Period.</i>
A.—Dairy cattle in milk—	
1. Kept under rural conditions.	1½ cwt. cake or meal and 1½ cwt. offals or grains.
2. Stall-fed and kept under town conditions.	2 cwt. cake or meal and 3 cwt. offals or grains.
Calves under 6 months ..	¼ cwt. cake or meal and ¼ cwt. offals or grains.
B.—Horses used for agricultural purposes.	¼ cwt. offals (bran).
C.—Bulls over 6 months kept for breeding.	1½ cwt. cake or meal.
Sows in farrow and boars ..	2 cwt. offals or grains.
Store pigs	⅝ cwt. offals or grains (= 1 lb. per day).

NOTICE OF BOOKS.

Food and How to Save It (3rd Edition). Edmund I. Spriggs, M.D., F.R.C.P. (London: H.M. Stationery Office, 1918, 3d. net).—This publication of 55 pages is issued under the auspices of the Ministry of Food for the help of those who are interested in the present food question. Information on the various kinds of food, including bread and cereals, meat, fish, fruit and vegetables, is given, and the relative values of different foods in terms of calories is shown in a table and a coloured diagram. Suggestions as to the dietary for different classes of workers are offered, with a view to assisting people in living on the scale of rations prescribed by the Food Controller. A number of useful war-time recipes are also given.

A limited number of copies is available (gratis) for public speakers and others interested. Application should be made to the Ministry of Food (Room 605), Palace Chambers, Westminster, London, S.W. 1.

Rats and Mice as Enemies of Mankind. (London: British Museum (Natural History), Economic Series No. 8, 1918, 1s. net.) The author of this pamphlet, Mr. M. A. C. Hinton, shows how urgent is the necessity for co-ordinated action in reducing the numbers of rats and mice in this country. He points out the immense amount of damage to food caused by these vermin and the extent to which they are carriers of disease, and suggests various methods for their extermination. The two species of rats, the black rat and the brown rat, and the one species of mouse, in Great Britain, are described, and an account given of their history and breeding and general habits. The pamphlet contains 63 pages, and is illustrated by two plates and six text figures.

MISCELLANEOUS NOTES.

THE *International Crop Report and Agricultural Statistics* for September, 1918, published by the International Institute of Agriculture,

Notes on Crop Prospects and Live Stock Abroad.

gives particulars concerning the production of the cereal crops of 1918 in certain countries in the Northern Hemisphere. *Wheat*.—The production in Spain, England and Wales, Canada, United States, British India, Japan, Egypt, and Tunis is estimated at 224,420,000 qr. in 1918, against 191,613,000 qr. in 1917, or an increase of 17·1 per cent. *Rye*.—The estimated production in Spain, Canada, and United States is placed at 13,096,000 qr. this year, or an increase of 27·3 per cent. compared with last year, when it amounted to 10,288,000 qr. *Barley*.—The production in Spain, England and Wales, Canada, United States, Japan, Egypt, and Tunis is estimated to amount to 62,595,000 qr. in 1918, against 60,674,000 qr. in 1917, or an increase of 3·2 per cent. *Oats*.—It is estimated that the total yield in Spain, England and Wales, Canada, United States and Tunis will amount to 213,894,000 qr. in 1918, against 221,321,000 qr. in 1917, or a decrease of 3·4 per cent. *Maize*.—The production in Canada and United States is estimated at 312,575,000 qr. this year, against 369,406,000 qr. last year, or a decrease of 15·4 per cent.

Denmark.—According to an official report for 1st September, the condition of wheat has somewhat improved and other crops maintain their promise. Wheat and rye are over average, barley about average, but oats under average. Potatoes are over average. (*London Grain, Seed, and Oil Reporter*, 19th September, 1918.)

Italy.—According to an official announcement, the yield of wheat this year will amount to some 20,000,000 qr. against 17,500,000 qr. last year. (*The London Grain, Seed, and Oil Reporter*, 21st September, 1918.)

Netherlands.—According to a report received from H.M. Consul-General at Rotterdam on agricultural conditions during the period 15th July to 15th August, the rain, followed by better weather, had been beneficial, and the general prospects throughout the country were as follows: (100=excellent; 90=very good; 70=good; 60=fairly good; 50=moderate; an average crop is indicated by 67.) The figures in brackets give the condition of the crop in July. Wheat, 71·2 (71·7); winter barley, 69·0 (69·2); summer barley, 61·8 (62·8); oats, 63·2 (58·8); rye, 71·5 (71·0); beans, 68·6 (69·5); peas, 66·4 (69·7); potatoes, 63·2 (60·0); clovers, 64·9 (57·5); meadows, 66·0 (46·7).

Sweden.—According to the official crop report issued at Stockholm on 16th September, the weather, which, during August had been very favourable for harvesting, had been, during September, wet and cold. In the south and middle of Sweden harvesting was finished, but further north it was still going on. Barley and oats are full average crops, but the hay crop is small. The condition of crops at the end of August was as follows, last year's figures being given in brackets (5=very good; 4=good; 3=average; 2=small):—Wheat, 3 (2·4); barley, 3 (2·8); oats, 3 (2·8); rye, 3 (2·0); mixed corn, 3·1 (2·5); hay, 2·1 (2·3); potatoes, 3·3 (3·3). The area under wheat and rye has been increased by 178,000 acres, this gain being obtained at the expense of oats, meadows, and fallow land. (*Broomhall's Corn Trade News*, 2nd and 8th October, 1918.)

Canada.—The High Commissioner for Canada, in a report dated 26th September, states that a preliminary estimate issued by the Dominion Bureau of Statistics gives the yield of wheat per acre for all Canada as follows: Spring wheat, $12\frac{1}{2}$ bush., against $15\frac{1}{2}$ bush. last year, and an average for the last ten years of 19 bush.; autumn wheat, $16\frac{1}{2}$ bush., against $21\frac{1}{2}$ bush. last year and a ten years' average of 23 bush.

United States.—According to the report issued by the Bureau of Statistics of the Department of Agriculture, the following are the estimated yields of cereals for the present year as indicated by the condition of the various crops on 1st October (the final official returns for last year are given in brackets): Winter wheat, 556,000,000 (418,070,000) bush., being an average yield of 15.3 (15.2) bush. per acre; spring wheat, 363,000,000 (232,758,000) bush., or 16.1 (12.6) bush. per acre; all wheat, 919,000,000 (650,828,000) bush., or 15.6 (14.2) bush. per acre; barley, 237,000,000 (208,975,000) bush., or 26.0 (23.7) bush. per acre; oats, 1,535,000,000 (1,587,286,000) bush., or 34.5 (36.4) bush. per acre; maize, 2,718,000,000 (3,159,494,000) bush., or 23.9 (26.4) bush. per acre; linseed, 15,600,000 (8,473,000) bush., or 7.9 (4.7) bush. per acre. The average quality of spring wheat is 94.8 (92.7) and of oats, 93.6 (95.1), and the average condition of maize is 68.6 (75.9), and of linseed, 70.8 (51.3). (*The London Grain, Seed and Oil Reporter*, 9th October, 1918.)

South Africa.—According to the July report of the Department of Agriculture, the wheat area this year is 2 per cent. greater than last year, when there was an increase of 23 per cent. over the previous year. Last year the acreages of barley and oats showed an increase of 2 and 3 per cent. respectively, but this year both show a decrease of 5 per cent. This year's yield of wheat is estimated at approximately 2,860,000 muids (about 1,000,000 qr.) (*The London Grain, Seed, and Oil Reporter*, 2nd October, 1918.)

Live Stock in New Zealand.—The number of sheep in New Zealand on the 30th April, 1918, was 26,354,594, as compared with 25,270,386 on the same date in 1917, or an increase of 4.3 per cent. (*International Crop Report and Agricultural Statistics*, September, 1918.)

THE reports furnished by the Crop Reporters of the Board on agricultural conditions in England and Wales show that September was everywhere a very wet month, causing much delay in the fields. Corn which had not been carried by the first week of the month was very often still in the fields at the beginning of October, and this had caused sprouting in many parts of the country, most damage being done in the north and west. The corn which has been harvested during this month is generally not in good condition.

In Lincolnshire a certain proportion of the main crop of potatoes has been lifted, but elsewhere little has been done, apart from harvesting the earlies and second earlies, owing to the protracted corn harvest and wet weather. Very little disease is reported, and prospects for a yield about 3 per cent. above the average are still maintained.

The roots have grown well during the wet weather, and prospects have somewhat improved, especially those of turnips and swedes, although they are still of small size, and fields are often patchy. Their yield is expected to be about 91 per cent. of the normal, while that of mangolds, which would have done better with more warmth, is expected to be 96 per cent. of the average.

Turnips grown for seed in the eastern counties have generally yielded satisfactorily, but the quality of much of the mangold seed has been affected by the wet; and prospects for red clover are not satisfactory.

Autumn cultivation is, upon the whole, backward, although there are districts—those where much of the corn was secured during August—where it is often considered to be forward. But the very wet weather has in most parts of the country prevented much work of this character, even where the corn crops have been cleared. Much ploughing has been done by tractors, which are of great assistance.

Seeds are rather variable, but in many places there is a good healthy plant, and they are satisfactory as a whole, though often patchy. Some harm is being done by the corn stooks remaining so long in the fields.

Pastures generally have plenty of grass, but from all parts it is reported that its quality or feeding value is poor, owing to the excessive wet. Live stock can consequently only be said to have done moderately well during the month, the cold and wet, combined with scarcity of artificial foods, having been against them.

Labour continues scarce, but with relatively little work possible the deficiency has not been so severely felt as in some months.

The following local summaries give further details regarding agricultural conditions in the different districts of England and Wales:—

Northumberland, Durham, Cumberland, and Westmorland.—In a few districts there is sufficient labour, but generally increased numbers would be welcomed.

Agricultural Labour in England and Wales during September. *Lancashire and Cheshire.*—The supply of labour is generally short, but owing to the wet weather the deficiency has not been felt so much as it would have been under better conditions.

Yorkshire.—On the whole the supply of labour is not very deficient.

Shropshire and Stafford.—Labour has been very scarce, especially in districts where the women have been employed in blackberry gathering, but with the help available the work has been done.

Derby, Nottingham, Leicester, and Rutland.—Though the supply of skilled labour is short, sufficient soldiers, women, and German prisoners have generally been available.

Lincoln and Norfolk.—In a few districts the supply of labour is short, but as a rule enough unskilled workers are available.

Suffolk, Cambridge, and Huntingdon.—Conditions are unchanged. The work has been kept in hand by the labour available.

Bedford, Northampton, and Warwick.—The supply of labour, though deficient in a few districts, is generally about sufficient to meet the requirements.

Buckingham, Oxford, and Berkshire.—Temporary help has been sufficient except in the case of thatchers.

Worcester, Hereford, and Gloucester.—The supply of labour is generally deficient, but in a few districts owing to local circumstances it has not been much felt. Assistance has been rendered by women, soldiers, and prisoners of war.

Cornwall, Devon, and Somerset.—Labour is very scarce, particularly skilled men, and the shortage has been made up to some extent by the employment of women, soldiers, and war prisoners.

Dorset, Wiltshire, and Hampshire.—The supply of labour is short, but the work has been carried on with the usual assistance.

Surrey, Kent, and Sussex.—Conditions are little changed. Labour is short, but substitutes have in many cases done excellent work.

Essex, Hertford, and Middlesex.—The supply of labour, especially skilled, is deficient, but with soldiers, women, and German prisoners helping, farmers are just about able to cope with the work.

North Wales.—The supply of labour is deficient.

Mid Wales.—Skilled labour is very scarce, but with the help of soldiers, women, and prisoners of war the farmers have been able to get through the work.

South Wales.—Skilled labour is lacking, but temporary help has been sufficient.

THE JOURNAL

OF THE

BOARD OF AGRICULTURE

Vol. XXV. No. 8.

NOVEMBER, 1918.

EDITORIAL NOTES.

THE conclusion of the fourth armistice, signed by the German representatives on the 11th November, brings with it the end of a great struggle—a struggle maintained not only by the fighting power of the forces of the Army and Navy but also by the heavy labour of our civil population at home. The victory of the Allies means much, and, so far as British farmers are concerned, it means that the food menace has been met. In this success the farmers have taken their share by the production of food at home. They will be gratified to know, from the preliminary statement recently issued by the Board, that taking the five crops—wheat, barley, oats, beans, and peas together—the gross production in England and Wales this year is quite 35 per cent. more than in 1917. Whether judged by the yield from an acre or by total production, all crops were better than in 1917. The fact that peace is now within arm's reach, as it were, is nevertheless no warrant for any relaxation of agricultural effort, for wastage has been great, shortage will be long-continued, and the demand for food will tax the world's resources. In the United Kingdom, therefore, the food production campaign must continue in the future until our arable soils produce more nearly their maximum, until the unprofitable grass lands are ploughed and the rest improved for the production of milk and meat, and until we are less dependent on imported essentials than hitherto. In the words of the Right Hon. R. E. Prothero (*President of the Board of Agriculture*) in a letter recently addressed to Lord Bledisloe: "Peace has its dangers as well as war. The need for home-grown food, both human and animal, is as urgent as ever. We cannot relax our efforts. We must continue to strain every nerve, and put out every muscle to produce every pound of bread and meat, every gallon of milk, and

every pound of vegetables we can. We must see to it that everywhere our existing arable land is cleaned and cultivated to the full, and that cultivation of each holding is raised to the best level of farming in the district."

* * * * *

FARMERS who have recently agitated for a part removal of the prohibition of the use of barley for stock-feeding, say to the extent of granting them 10 per cent.

Feeding Stuffs.

of their crops, will be glad to learn of the announcement just made (see p. 1029) that one-fifth (or 20 per cent.) of their threshings of barley may now be used by them for feeding purposes. In view of the increased acreage and yield of barley this year this concession will be most welcome, as it will make no less than 3,000,000 qr. of a valuable feeding stuff available for stock. It was further announced that the Cabinet have sanctioned a reduction in the percentage of flour to be taken from wheat, and this will provide an increase of approximately 18,000 tons weekly of offals for feeding purposes. This offal, moreover, will be of substantially higher quality than that now available. There is thus every prospect that the feeding-stuffs position will be relieved very early.

* * * * *

ALTHOUGH, as indicated above, there is soon likely to be some relief in the matter of feeding stuffs, farmers must not give way to extravagant hopes of plentiful supplies in the near future.

Economy.

Tonnage will still be restricted, and the demand upon it will be great. Farmers must aim at producing as much as possible of the feeding stuffs they require. It is essential that in the use of available feeding stuffs, fertilisers and other supplies, the strictest economy should be practised.

* * * * *

It has been generally known that the Army has devoted considerable attention during the last year or two to

Army Agriculture.

food production, particularly as regards potatoes and other vegetables, and widespread interest has been taken in the several reports on the subject which have been published in the Press. In an article in this issue (p. 929) the Army Agricultural Committee gives a fairly full account of what the Army has been able to accomplish in the direction of food production—a statement which is of special interest at the moment when hostilities have been brought to a successful termination.

* * * * *

A NUMBER of species of birds are responsible for considerable depredations in connection with the farmer's seed grain, and

**Protection of Seed
Grain from Birds.**

at this season of the year when other food is scarce, they occasionally cause great destruction in the newly-sown fields. Various steps are taken by farmers to prevent or reduce these losses, and anything which may assist to the desired end is likely to receive immediate attention at their hands. Apart from the protection from birds, it is essential that destructive dressings should not seriously impair germination of the grain, as it is feared is the case with some of the commonly used materials—particularly when these are carelessly employed. Farmers might, therefore, usefully read the note as to acetone tar given at p. 1021.

* * * * *

THE attention of the editor has been called to the fact that some issues of the *Journal* rapidly become out of print and that

**Notice to Readers
of the "Journal."**

it is not easily possible to obtain copies when required. It seems desirable, therefore, to point out that owing to difficulties in connection with printing and the shortage of paper, the edition of each issue of the *Journal* is strictly limited to the number of copies which have been estimated to be readily disposable, with a small allowance for contingencies. For the last two or three years, however, the demand for the *Journal* has increased month by month, and the tendency is for each issue to run out of print at an early date after publication. Those who desire to receive the *Journal* regularly are advised to become regular yearly subscribers, as it is not possible to guarantee that an application for any issue can be met two or three weeks after publication. For example, a regular recipient of the *Journal* recently stated that he has given away numbers which contained special articles, thinking that they could easily be replaced, only to find that this was not the case.

* * * * *

IN the August issue of this *Journal*, p. 518, it was stated that a central authority for afforestation for the United Kingdom

**Forest Authority
for the
United Kingdom.**

would be set up, and that a policy of planting would be pursued with the least possible delay. It has recently been announced that an Interim Forest Authority has been appointed to make preliminary arrangements for developing afforestation in the United Kingdom, the

members being :—the Right Hon. F. D. Acland, M.P. (*Chairman*), Lord Clinton, Major David Davies, M.P., Colonel Walter Steuart-Fotheringham, Brigadier-General Lord Lovat, K.C.V.O., K.T., Mr. T. B. Ponsonby, Mr. R. L. Robinson, and Mr. A. MacCallum Scott, M.P.

Mr. R. L. Robinson has for several years held the position of Superintending Inspector for Forestry in the Board of Agriculture and Fisheries. This position he has now relinquished.

The temporary address of the Authority in England is 1, Whitehall, London, S.W. 1. It will not be possible at present to give personal interviews to applicants for appointments or training.

The carrying into effect of a sound forest policy in this country is, from several points of view, of the utmost national importance, and the hope may be expressed that the new forest authority will everywhere receive sympathetic support from farmers, estate agents, and landowners alike.

* * * * *

WHEN the Report on beef production by Messrs. Mackenzie and Marshall was published in the September issue of the *Journal* (p. 623), it was stated that the

**Report on
Beef Production.**

full Report would be printed later. It is desired to give notice that, owing to difficulties in connection with printing and the shortage of paper, the publication of the full Report has been postponed ; should publication follow at a later date, notice will be given in the *Journal*.

* * * * *

IN view of the great attention which is now being devoted by farmers and farmers' associations to organisation and co-

**December Issue of
the "Journal."**

operation in relation to agriculture, it is proposed that the December issue of the *Journal* shall be largely devoted to a consideration of various phases of the subject. The authors of the articles will be a number of gentlemen who have made a very close study of agricultural organisation and who have the farmers' interests very much at heart.

ARMY AGRICULTURE.

THE following article has been contributed by the Army Agricultural Committee :—

Speaking generally, three years ago there was no such thing as Army Agriculture. In 1915 a little flower garden was to be found here and there, and whitewash helped to smarten a camp. A year later the growth of small vegetables and relishes was begun; one officer boasts that he has grown his own mustard and cress for two years! It was not until 1917, when a national shortage of food was threatened, that the Army began to bestir itself; then, too, it was gradually recognised what a large quantity of good land had been appropriated for military purposes. Through the winter of 1917 many units proceeded to break up plots, small and large, with the co-operation of the Director-General of Lands. At the same time, encouraged by the Director of Supplies and Transport, schemes were initiated for cultivations in France, Egypt, Salonika and Mesopotamia.

Growth of Army Agriculture.—By January of this year Army cultivations had assumed such large proportions that the Army Council decided to appoint a Committee to co-ordinate and help with the work. The Committee was called the Army Agricultural Committee; Viscount Harcourt accepted the Chairmanship; two officers from the Lands Branch and a representative of the Food Production Department were appointed to serve on the Committee; and an officer from the Quartermaster-General's Staff became the Secretary. Army agriculture was now booming. On 16th March, 1918, an Army Council Instruction was issued (No. 280 of 1918). "The Army Council," it began, "desire to impress upon all ranks the need of increasing the supply of food and of growing it where it will be consumed, thereby reducing transport. Every opportunity should be taken to cultivate lands in and adjacent to barracks, camps, command depots, and hospitals." The Commander-in-Chief in each Command in the British Isles has appointed a Command Agricultural Committee with agricultural officers to advise units. The War Office has provided money for initial expenses where required, and Army manure free when locally available. Some additional labour, to supplement the work done by men in their spare time, has been found, from the Labour Corps, Non-combatant Corps, and Prisoners of War.

The two main objects of the Army Agricultural Committee at home are to prevent the waste of the large acreage of agriculturally valuable land now in the occupation of troops, and as far as possible to make the Army self-supporting in potatoes and other vegetables. With regard to the prevention of waste, just over 6,500 acres are to-day being cultivated by the Army in Great Britain and Ireland; this is largely made up of plots of from 2 or 3 to 30 yards square. In some camps every available corner has been tilled between and round the huts; in others, an old parade ground has been dug up by hand, manured and planted.

In spite of the remarkable results which have been achieved, the aim of Army cultivation to make His Majesty's Forces self-supporting in potatoes and other vegetables is as yet far from being realised. Allowing an average production of horticultural cultivation of 10 tons to the acre, the produce of the 6,500 acres now under cultivation will suffice to supply not more than 300,000 men with the full Army ration of fresh vegetables. In this connection it is interesting to note that the Armies in France are producing more than half the quantity of potatoes and vegetables (100 tons a day) that are being raised by the forces at home. Having regard to the difficulties under which the Army carries on its cultivation these achievements are of no mean order, and the value of the work done is to be measured, not only by the quantity of produce raised, but also by the effect of supplies of fresh vegetables on health, for, as is well known, these foods are Nature's chief preventive medicine against such diseases of malnutrition as scurvy.

It is a curious coincidence that the rate of increase in the acreage under Army cultivation during the past two years has been almost identical with the rate of increase of small cultivation by the civilian population in this country.

The assistance rendered by the Food Production Department to the Army in all this work cannot be overestimated, and sincere thanks are due to the officials of that Department, who have been indefatigable in their co-operation.

Difficulties.—Such in briefest outline is the agricultural work being done by His Majesty's Home Forces. But it is not all plain sailing. Any commanding officer will tell you the difficulties. Labour comes first. Three years ago it would have been an easy matter to find men to do some digging, but now every man is examined and re-examined and combed out until labour for the gardens has to be picked up as and when it can be found; one officer, who is responsible for 14 acres, reckons that the

FIG. 11.—A fine Root Crop at Whitehall Farm, Aldershot

average length of time an individual soldier works for him is an hour-and-a-half ! Even the farmer has not such a good cause for grumbling as that. Then the land is not always of the best, and some units are in quarters where cultivation is impossible ; it is not difficult to find units bravely struggling to carry out the Instructions of the Army Agricultural Committee among sand dunes or on barren heaths. Then a unit may be moved at a moment's notice, and perhaps the camp vacated may be empty for the busiest gardening month of the year. It may also be impossible to find either among officers or men any one who knows even the elements of horticulture. One unit wishing to beautify its camp decided to plant 50 small fir trees. With great labour 50 holes were dug ; next the trees were fetched. To the dismay of the officer in charge, the holes were found to be too small and the roots of the trees were therefore cut to fit the holes. This officer is still asking the casual visitor why his 50 trees are dead !

In the majority of cases, however, the standard of agricultural and horticultural knowledge possessed by officers and men is remarkably high, and to this fact is due not only the enthusiastic manner in which cultivation is being undertaken but also the success which is attending it.

Examples of Successful Work.—Three examples—of many which might be given—may be chosen to illustrate the work which is being done by units.

(1) An officer of the Army Ordnance Corps has 20 men under him ; he has rented one acre adjoining his camp and has more than enough vegetables to feed all his men for the year ; he has been growing potatoes, carrots, onions, broad beans, dwarf beans, runner beans, beet, cabbage, cauliflower, broccoli, Brussels sprouts, savoy, kale, shallots, leek, peas, turnip, radish, lettuce, marrow and tomato.

(2) At a very large hutted camp in the North of England, every small plot between and around the huts has been dug up and planted, mostly with potatoes. If it is found that one parade ground less would not interfere with training, it is dug up, with pickaxes if necessary. The area of all these plots added together is 200 acres, and, in addition, 250 acres adjoining the camp have been taken over and broken up for food production ; a hard-headed Scottish farmer of low medical category manages this considerable farm.

(3) The third case is that of a commanding officer who was also a keen farmer, but found himself on impossible farming land ; he therefore set to work to make use of the sewage

from his camp and is now growing cabbages on 16 acres of cleverly-irrigated land.

Live Stock.—Although the main agricultural energies of the Army are concentrated on growing vegetables, a certain amount of live stock is kept, but this is only encouraged to any great extent when there are no neighbouring farmers able and willing to make use of swill and refuse. The stock includes pigs, sheep, goats, rabbits, hens, geese, turkeys, and (in cases) bees. Everything produced by the Army is consumed instead of, not supplementary to, the ordinary ration, so that the result is a direct saving of food.

Almost every scheme, big and small, is a success financially—as, of course, it ought to be. Units have nothing to pay for their labour, as a general rule, and they get the land rent free with as much manure as is available. The chief expenses, therefore, are for seed and implements. Large profits are often the result, two-thirds of which in many cases come back to the State. Land, which three years ago produced nothing, now not only grows valuable food but returns to the taxpayer what in the aggregate amounts to a considerable sum of money.

Army Agriculture in the Theatres of War.—So much for the agricultural activities of the Army in the British Isles. It is not considered desirable to give detailed figures of cultivated acreage in the different theatres of war, but in each theatre very large schemes have been and are being undertaken, and as food is produced abroad a corresponding amount of valuable tonnage is being saved.

Mesopotamia.*—The largest schemes undertaken by the Army are in Mesopotamia, where by skilful irrigation very large areas can be put under cultivation and made to yield results far greater and at less cost than anywhere else in the world. It is estimated that 850,000 acres are now under wheat or barley, and this will be increased to 1½ million acres in 1919. In 1919, it is estimated that 100,000 tons grain and 150,000 tons bhoosa will be available for the use of the Forces operating in that theatre of war besides large amounts for the native population. It is evident that a very great saving of tonnage is thereby effected at a time when such saving is of the utmost importance. Besides these schemes, vegetables are grown on a very large scale for the troops, and dairy farms have also been started.

Palestine.—In the occupied territories in Palestine, which are claimed to have great possibilities, considerable areas will be put under cultivation during the autumn of 1918.

* See also p. 1031.

FIG. 12.—Haymaking on War Department Land, Aldershot.

FIG. 13.—Haycutting at Whitehall Farm, Aldershot. An Average Crop of 25 cwt. per acre was obtained from Derelict Land.

FIG. 15.—A fine Show of Vegetables grown on Reclaimed Land.
Whitehall Farm.

FIG. 16.—Prize-winning Onions at the Aldershot Agricultural Show,
grown at Whitehall Farm.

Salonika.—The Forces in Salonika are self-supporting as regards green vegetables, and are growing crops of potatoes, grain and fodder. The soil of Macedonia is extremely fertile and a good yield is obtained.

France.—In spite of the fact that it is on the front in France that the greatest amount of fighting and movement takes place, even here agricultural operations are undertaken which result in a large supply of vegetables, cereals and fodder. Some 20,000 acres of derelict crops are being harvested this year by the British Armies alone, off land behind the lines evacuated by the French farmers. In some cases binders have been at work within a mile of the front line. In addition to all this the supply of vegetables from camp and Army gardens is most satisfactory and of appreciable assistance to the Supply and Transport Department.

Agriculture in the Army is popular, and the success of a unit in this branch as in most others depends on the commanding officer. If he is lukewarm, it is simple to find adequate military excuses for doing nothing; if he is keen, the work gets done somehow: defaulters can be put on to dig; men can be encouraged to work overtime. In more than one case where 20 men have been urgently required for two hours' work the officers of a unit led by their commanding officer have postponed their dinners. Commanding officers on the whole are, fortunately, keen; so are all Commanders-in-Chief, also His Majesty the King, whose letter of congratulation given below has done much to encourage Commands in their cultivations.

“BUCKINGHAM PALACE,

My dear Harcourt,

20th June, 1918.

During the King's recent visit to Aldershot, His Majesty had further occasion to see there, as elsewhere, the wonderful progress that is being made in cultivation under the direction of the Army Agricultural Committee.

The King has also heard with admiration and wonder of the agricultural work that is being carried on, not only in other parts of this country but also in various war regions overseas, and I am commanded to convey through you to the Agricultural Committees in the various Commands, His Majesty's congratulations on this most valuable and important contribution towards the food supply of the Army both here and abroad.

Yours very sincerely,

(Signed) STAMFORDHAM ”

By a friendly arrangement with the Air Board the Army Agricultural Committee is lending its assistance to the promotion of cultivation by members of the Royal Air Service, and already in some aerodromes a border of potatoes and vegetables "divides the desert from the sown."

Finally, it is to be remembered that the Army has rendered, and is rendering, a large measure of help to farmers by supplying them with labour, and this not in large drafts only but also locally and in detail.

REPORT OF THE EDUCATION BRANCH FOR THE YEAR 1916-17.*

THE Report of the Education Branch for the financial year 1916-17—the preparation of which has been delayed owing to pressure on the depleted staff of the Branch—deals with the educational, research and advisory work of the various Institutions and Local Education Authorities during the previous scholastic year. The Grants shown in the tables below include, however, in some cases, instalments of the subsidies payable in respect of more than one educational year, and comparisons with the amounts paid in the previous year must, therefore, take account of adjustments which have sometimes to be made outside the financial years dealt with.

Table I. shows the Grants paid to Institutions providing Higher Agricultural Education. These Grants, which are made from the Board's Parliamentary Vote, have been reduced or withdrawn in certain cases, in obedience to Treasury injunctions, where the financial position of the Institution was such as to warrant that course. In addition to the two War casualties among these Institutions noted in last year's Report (the Royal Agricultural College, Cirencester, and the Uckfield Agricultural College) a further loss has to be recorded in the closing of the Holmes Chapel College, Cheshire. On the other hand, the Seale-Hayne College, Newton Abbot, makes its début, with a Grant of £200, which was made in aid of the equipment of the College Farm when the Institution was opened for the training of women for work on the land. The College buildings, the completion of which had to be suspended after the outbreak of war, have lately been taken over by the War Office for use as a military hospital. The new buildings erected for the

* Owing to the War this Annual Report is not being issued separately in its pre-war form.

Midland Agricultural and Dairy College at Sutton Bonington are also in military occupation, as well as those of Armstrong College, Newcastle-upon-Tyne, which have been in use as a hospital since the commencement of the War.

As was inevitable, the attendance of students for long courses at these Institutions (348) showed a further material falling-off from pre-war standards (1,200). On the other hand, the increase noted last year in the number admitted for short courses (665) was maintained, the special arrangements made for

* The amount shown is the sum which was paid in the financial year. The Grants are sanctioned in respect of the academic year ending 30th September, but in order to meet the convenience of Institutions, payments on account are made from time to time, and the sum actually paid in the financial year in some instances includes amounts in respect of more than one academic year.

the training of women farm workers having been renewed. Scholarships, generally of four weeks' duration, were offered by the Board to provide training in light farm work for women selected by the local Women's Committees and most of the Institutions admitted pupils up to the limit of the accommodation available. In addition to these institutional courses, special arrangements were made by Local Education Authorities in many cases for the training of women on private farms, with results that have amply justified the experiment. At the end

of the year under review the responsibility for the organisation and training of woman agricultural labour was taken over by the Women's Branch of the newly-constituted Food Production Department.

The Grants shown in Table II., which come from the Development Fund, are made in respect of the salaries and expenses of Special Advisory Officers appointed by the Institutions named in pursuance of the Board's Agricultural Research and Advisory Scheme, to undertake local investigations and provide technical advice for farmers in the areas associated with the Institutions. The work of these officers is intended to supplement the activities of the County Agricultural Staffs, who are invited to refer to the Collegiate Centre any problems requiring more specialized knowledge or *ad hoc* investigation.

Grants to Research Institutes (Table III.) also owe their origin to the Development Fund. The policy pursued here has been to concentrate research on a particular subject so far as possible at a single Institution, and developments with a view to secure a greater degree of co-ordination of work on related subjects are now under consideration.

It would not be possible within the limits of this Report to give a summary of the work in progress at these Institutes, and those interested are referred, therefore, to the periodical publications issued by the Institutes themselves, either separately or in the scientific press. A summary of the investigations carried out last year at the Bristol University Research Station (*National Fruit and Cider Institute*), Long Ashton, appeared, however, in the June number of this *Journal* (p. 316); and the monthly Notes on Feeding Stuff contributed by the *Animal Nutrition Research Institute* at Cambridge have continued to be appreciated by readers in want of a guide to the economics of war-time prices and substitutes.

The investigations conducted by Professor Biffen at the *Cambridge Plant Breeding Institute* continue to give results of far-reaching economic importance, opening out a new chapter in crop improvement. Recognition of the practical value of Professor Biffen's discoveries of the possibility of transmitting and combining desired qualities in different varieties of wheats is already forthcoming in the project for the establishment of a National Institute of Agricultural Botany, foreshadowed in the July number of the *Journal* and alluded to by Mr. Prothero in his speech in the House of Commons on the 18th of that month.*

* See this *Journal*, August, 1918, p. 522.; also footnote (*) on p. 1005.

Less obvious, perhaps, though hardly less important, is the value of the researches in Plant Nutrition and Soil Problems conducted at the *Rothamsted Experimental Station* under the

† In addition, a Grant of £450 in respect of the Bristol University Research Station is included in the Statement of Higher Agricultural Education Grants.

‡ Includes Special Grant of £100 in respect of the deficit on the working of the Station in 1914-15.

|| Includes £100 Capital Grant in respect of building Digestibility Laboratory.

direction of Dr. Russell. For example, the study of the reciprocal relationship of protozoa and bacteria in soils under natural conditions may lead to practical results of much importance; while such questions as the losses of nitrogen from farmyard manure heaps, the vitality of buried weed seeds, and the search for a satisfactory sterilising agent which will effectively control soil insect pests without injuring crops, have an obvious bearing on problems of actual moment, of which the breaking up of grass land necessitated by the present food conditions provides a considerable number.

This *Journal* for April, 1917, contains a Report on the Experiments on the Effect of Electricity on Plant Growth carried out during 1916 by the *Imperial College of Science and Technology*. These experiments, which gained a retrospective interest from the attention given to the subject in the general press in the early part of this year, were not conclusive as to the conditions under which the electrical effect (if any) is produced, and any recommendations for general adoption must await the result of the further trials now being carried out under the supervision of the Electro-culture Committee appointed by the President at the beginning of the year to advise on the engineering, meteorological and other problems involved.

Before passing from the Research Institutes it is a mournful duty to record the death, from wounds received in action, of three valued workers in agricultural science: Dr. Harold Ackroyd, R.A.M.C., who held the position of Physiologist to the Cambridge Animal Nutrition Institute from October, 1912, to September, 1914, and whose distinguished service at the Front gained him successively the M.C. and V.C.; Major P. G. Bailey, M.A., who, after completing the three-years Research Scholarship awarded to him by the Board in 1911, was working as Assistant to Professor Punnett in the Department of Genetics at Cambridge until the outbreak of the War, when he joined the R.F.A.; and Mr. E. W. Barton, B.A., another of the Board's Research Scholars, who obtained permission to postpone the completion of his course in Agricultural Economics, begun at Oxford University, in order to answer the call of patriotism.

There remains to be noted the educational work of the County Councils. Activities here were again directed mainly towards war problems, the agricultural staffs acting in close co-operation with the War Agricultural Committees. To the Executive Committees of the latter were delegated the statutory powers conferred on the Board by the Cultivation of Lands Order, 1917,

and the services of the Agricultural Organiser were usually requisitioned as Chief Executive Officer. The functions of the Organisers in this capacity fall within the purview of the Food Production Department, which was instituted at the beginning of 1917, and their work receives appreciative notice in the Reports of that Department.

Of the itinerant work of the counties perhaps the most noticeable feature has been the work of the Travelling Cheese Schools, which, with the aid of sets of apparatus supplied by the Board, have done much to encourage the production of cheese from milk not required for immediate consumption.* A further development in this direction has been the establishment of Milk Co-operative Depots in selected areas; but progress under this head will be reported on in due course by the Dairy Branch, which was recently set up to deal with these matters.

The schemes for the distribution of eggs and day-old chickens to cottagers and small holders, first instituted in 1915, were continued successfully in the following year, and, despite the great difficulties encountered in obtaining supplies of feeding stuffs, it has been found possible to renew the arrangements in each subsequent year, though on a slightly reduced scale.

Of the other items shown in the final summary below, mention only need be made of the Capital Grants for Farm Schools, which were either for the completion of buildings already in an advanced stage, or for some special purpose which did not admit of postponement; the Grants towards Administrative Expenses of Advisory Councils, which were discontinued at the end of last year; and the Grants for Forestry Advisory and Research work, which went to the Universities of Oxford and Cambridge, University College, Bangor, and Armstrong College, Newcastle-upon-Tyne. Forestry work at all these Institutions has, however, been necessarily curtailed owing to the employment of the staffs on the work of the Timber Supplies Department of the Board of Trade.

Grants made from the Development Fund *through* the Board, though they do not appear in the above tables, call for mention as part of the administrative responsibilities of the Branch. The most important of these subsidies was a loan of £130,000 advanced to the British Sugar Beet Growers' Association for the purchase of the Kelham Estate of about 5,600 acres, near Newark, with a view to the institution of an experiment in the

* See also this *Journal*, August, 1918, p. 522.

growing of beet and the manufacture of sugar on a commercial scale after the War. Grants were also made to the twin Society for the Cultivation of Flax and Hemp, the operations of which are now directed by the Flax Production Branch; and to the Land Reclamation Society for preliminary surveys of Borth Bog, in Merionethshire, and Otmoor, in Oxfordshire, with a view to collecting data on which to form an opinion as to the economic possibilities of winning these areas back to cultivation.

The purposes to which the Grants of 1916-17 and the corresponding Grants of 1915-16 have been applied were:—

	1916-17. £	1915-16. £
Educational Grants to Universities and Colleges	11,960	16,120
Grants for Advisory Work	6,813	6,683
Grants to Research Institutes and other Research Centres	18,015	21,956
Grants for Special Research and other Investigations (including Miscellaneous Development Schemes and Emergency Experiments)	7,470	6,371
Research Scholarships (including Expenses of Selection)	658	1,796
Grants for Farm Schools, Technical Classes, Local Lectures, etc.	26,221	27,908

Grants towards the Expenses of Advisory Councils	915	1,160
Grants for Forestry Advice, Research and Experiments	2,551	3,058
	<u>£76,177</u>	<u>£98,646</u>

INJURIOUS WEED SEEDS IN GRASSES AND CLOVERS HARVESTED FOR SEED IN BRITAIN.

Introduction.—The Testing of Seeds Order, 1918,* in addition to providing for a declaration of the germination and purity of certain agricultural and horticultural seeds, also makes it necessary to declare the presence of certain weed seeds in grasses and clovers when the percentage of these exceeds 1 per cent. The plants, the seeds of which must be so declared, and which are scheduled as injurious, are the following: Docks and Sorrels (*Rumex* spp.), Cranesbills (*Geranium* spp.), Wild Carrot

* Printed in this *Journal*, July, 1918, p. 477.

(*Daucus Carota*, L.), Yorkshire Fog (*Holcus lanatus*, L.) and soft Brome Grass (*Bromus mollis*, L., et. spp.).

The presence of Dodder (*Cuscuta*, spp.) in clovers must also be declared.

Need for Special Care in Growing Seed.—It is probably not fully realised by farmers that great waste of good seed is involved in the cleaning of samples of grasses and clovers that are harvested with excess of weed seeds. Further, cleaning processes are expensive, and may entail serious delay in placing seeds on the market, while they add considerably to the price farmers have to pay for good, clean seed.

It should be obvious to all who grow crops for the production of seed that the best and most economical means of producing clean seed is to grow clean crops. This entails the preparation of a clean seed bed, the use of clean seed, and subsequent eradication of weeds in the growing crop. It may be admitted that the eradication of weeds from clover and grass leys is a difficult matter, but it may, nevertheless, be undertaken, particularly in the case of certain weeds. A clean seed bed and pure parent seed are undoubtedly the first essentials in the production of grass and clover seeds. It must be acknowledged that British farmers do not give the same attention to this important question as do growers in some other countries, and that, as a consequence, farmers themselves sow much very dirty and uncleaned seed, and home-grown seeds invariably take more cleaning than many of the imported stocks.

The value of Irish and Scotch Rye-grasses, Scotch Timothy, Irish Crested Dogstail and English Trefoil, Sainfoin, Red and White Clovers, as herbage plants is well established, and consequently the necessity for producing clean harvests of these cannot be too strongly emphasised.

The uncertainty of the British climate is partly responsible for the lack of attention paid to the production of grass and clover seeds. Fields are seldom sown with the definite intention of harvesting a crop of seed. Whenever seed is harvested in favourable seasons, however, farmers should never sow home-produced grasses and clovers without first sending the seed to a reliable merchant to be cleaned; or, even if their seed appears from inspection to be clean, a sample should be sent to the Seed Testing Station to be reported upon before it is used. This rule should be applied to all seeds grown by farmers for their own use.

The Importance of Clean Seed.—The importance of using clean seed may be better appreciated when it is stated that a large number of weed seeds may be introduced on to the land

by sowing grasses and clovers containing only 1 per cent. of any particular harmful weed.

The following figures are given as examples* :—

<i>Weed Seeds.</i>	<i>Approximate Number of Weed Seeds present in 1-lb. Samples of Grasses or Clovers containing 1 per cent. of any such Weed Seed.</i>
European Clover Dodder	18,000
Chilian Dodder	7,300
Dock	3,200
Sheep's Sorrel	10,500
Cut-leaved Cranesbill	1,900
Smooth Cranesbill	4,500
Wild Carrot	4,400
Yorkshire Fog (in glumes)	8,900
Yorkshire Fog (without glumes)	12,700
Soft Brome Grass	1,500

It should be noted that germination tests conducted at the Seed Testing Station on weed seeds contained in samples of grasses and clovers show that the capacity for growth of such seeds is usually high, and often higher than that of the samples containing them. If, for example, 20 lb. of Rye-grasses and 10 lb. of Red Clover were sown to the acre, and if this mixture contained only 1 per cent. of injurious weed seeds, and if only half of these seeds germinated, and again if only half of those which germinated produced plants, none the less at least 7 weeds would have been introduced on every square yard of the field.†

Weed Seeds Met with in Rye Grasses and Clovers.—The following particulars as to the weed seeds most commonly met with, and which are the most troublesome to remove from British-grown stocks, should be of interest to seed producers.

THE RYE-GRASSES.—The most difficult seeds to remove from the Rye-grasses are Soft Brome, Yorkshire Fog (especially when the seeds of this grass are large and well developed), and Rats Tail Fescue, or Squirrel Tail as it is often called. The two former are bad weeds of temporary leys. Buttercup and Cats Ear are also frequently-occurring weeds. The proper cleaning of Rye-grasses often entails a waste of from 5 to 15 per cent., the removal of Yorkshire Fog in particular necessitating the loss of a certain proportion of the finest grass seeds. French seed and that grown in the Fens are usually comparatively free from Yorkshire Fog and Soft

* See Leaflet No. 297.

† See Report on Seeds Purchased in Central and South Wales, Seasons 1915-16, *Journal of the Board of Agriculture*, Vol. XXIII., No. 9, pp. 845-846.

Brome. English Italian Rye-grass often contains the seed of campions in moderate quantity, but these are not difficult to remove from this grass.

RED CLOVER.—This seed is frequently harvested in a very dirty condition, perhaps especially in Wales and in the West of England. The most commonly-occurring weeds are Ribgrass, Cut-leaved Cranesbill, Wild Carrot, Campions, Docks, and Thistles. Of these Cut-leaved Cranesbill, or "Rollers" as it is often called, and Ribgrass are probably the hardest to remove. The waste may be as high as 60 per cent., and samples with as much as 40 per cent. of Cut-leaved Cranesbill are sometimes met with; the average wastage varies from 5 per cent. to 20 per cent., and will depend to a considerable extent on the degree of development of the Ribgrass and Cranesbill, this being, of course, affected by the season. In many districts Cut-leaved Cranesbill is more plentiful in Single-cut Cowgrass than in other Red Clovers, the seed of this variety of Red Clover ripening at the same time as the Cranesbill. Docks are also difficult to remove completely, but with modern machinery Docks, Wild Carrot and Campions do not present the same difficulties as formerly, though their elimination entails waste. Dodder is not so general in English as in foreign Red Clover, but when it occurs it is difficult and expensive to remove completely.

WHITE CLOVER.—This clover, like Red Clover, frequently contains an abundance of weed seeds difficult to remove. The most troublesome are the Soft Cranesbill, Sheep's Sorrel, Small Ribgrass, Self Heal, Docks and Campions. Soft Cranesbills are particularly difficult to clean out of White Clover; they may sometimes constitute 50 per cent. of the bulk of the sample, and it frequently happens that they are responsible for a wastage of about 20 per cent.

ALSIKE CLOVER.—There is not a great amount of Alsike grown for seed in this country. It is harvested later than White Clover, after the Soft Cranesbills have shed the bulk of their seed, so that these seeds do not present the same difficulties as with White Clover. Self Heal and Sheep's Sorrel frequently entail a moderate amount of waste in the case of Alsike.

TREFOIL.—This seed is generally grown in a state of greater purity than other herbage plants. The seed has, moreover, to be milled to remove the husk or "cosh" and it is easily cleaned both before and after milling. Campions, Field Madder and Cut-leaved Cranesbill sometimes give trouble, but the

waste connected with cleaning Trefoil is not usually great, and this partly accounts for the relative cheapness of the seed.

SAINFOIN.—Seed in husk is frequently infested with Burnet, and Soft Brome grass is also a common impurity, both of these weed seeds giving trouble in cleaning. They are, however, more easily removed from milled samples.

The amount of waste involved in cleaning and dressing seeds will, of course, largely depend upon the season. In wet seasons much damaged and poorly-developed seed has also to be removed. In extreme cases nearly 50 or even 70 per cent. of weed seeds, dirt, and damaged seeds, may have to be removed, and of grasses and clovers in general, it may be said that the waste in dressing home harvests is seldom less than 2 per cent.; while the wastage will vary from about 5 to 25 per cent.

The Eradication of Harmful Weeds.—The following notes are given as to the means which may be employed for the eradication from growing crops of those weeds which are scheduled as injurious in the Testing of Seeds Order. It must be again emphasised, however, that every care should be taken in the first instance to avoid sowing the seeds of these weeds with the grasses and clovers.

DODDER.*—Dodder does not usually occur in clover leys in the North of England, but is common in the Southern Midlands, and in the Southern, Eastern and Western Counties. When Dodder appears in a clover crop the patches should immediately be cut with a scythe, taking the Clover and Dodder together. Care should be taken to cut the patches beyond the apparent limit of the Dodder. The Clover and Dodder should be collected into heaps and covered with chaff and straw and burnt. Dodder is usually most plentiful in the aftermath; consequently, when Dodder has made an appearance in the first crop, the aftermath should always be kept closely grazed and on no account should a second cut be taken or the crop harvested for seed.

DOCKS.†—Docks are liable to occur on leys on practically all soils. They should be cut to prevent the seed ripening. This will not, however, kill the plants. The only satisfactory plan is to dig up every dock plant by the roots, since in the case of this plant new stems are developed from the roots left in the ground.

SHEEP'S SORREL.†—Sheep's Sorrel is most common on leys on peaty soils, and on sands and on non-calcareous soils

* See also Leaflet No. 180 for a fuller account of Dodder and its Eradication.

† See also Leaflet No. 253 (*Some Common Weeds. I.*) for a fuller account of Docks and Sorrels.

generally. This plant cannot be removed from young leys by any economical means of cutting or digging out. The only plan is to lime the land and so gradually improve the condition of the soil, and to include in the seeds mixture plants like Wild White Clover which will tend to crowd out the Sheep's Sorrel.

WILD CARROT.*—This plant is particularly abundant on dry calcareous and loamy pastures, but also in some districts abounds on heavy clays. Wild Carrot ripens its seed late and, therefore, usually does so in the second or aftermath cut.

Where Wild Carrot abounds, crops should not be cut for seed or a second time for hay; the aftermath should be grazed and the field run over with a machine with the knives set fairly high so as to cut off the flower heads before the seeds ripen.

CRANESBILLS.—The Cut-leaved Cranesbill is most plentiful on leys on heavy soils, but also abounds elsewhere. The Cut-leaved and Smooth Cranesbills are most frequently met with on calcareous and loamy soils. It is impossible to eradicate the Cranesbills by any economical means, and leys infested with these weeds should not be set aside for the purpose of harvesting seed. If these weeds are plentiful in fields from which it is for any special reason imperative to harvest seed, it might, in some cases, be practicable to dig up the plants with a fork before the field is put up to hay. As an alternative measure after the crop has been cut, it might be found possible to pick out the Cranesbills by hand from the swaths. These plants have red stems which would render them easily recognisable.

YORKSHIRE FOG AND SOFT BROME GRASS.—Both of these grasses are very difficult to eradicate from leys. The only practicable means is to cut the hay very early before these grasses have ripened their seed; this is, however, impracticable in the case of rye-grass harvests required for seed. In the case of Perennial Rye-grass, however, this procedure might be adopted in the first year, the seed harvest being postponed until the second year.

Notes on the Identification of the Weeds Scheduled as Injurious in the Testing of Seeds Order.—**DOCKS AND SORRELS.**—The Docks and Sorrels belong to the genus *Rumex* (Natural Order *Polygonaceæ*). The characteristic features of this group of plants are the thickened perennial rootstock, erect stems which die off each autumn, leaves with thin stipules, and numerous small

* See also *Journal Bd. Agric.*, July, 1912, p. 273.

green flowers which usually become reddish on ripening. The seeds of all the species are spindle-shaped, triangular in section and have a brown, shining surface. When occurring as impurities in seed samples these seeds are sometimes covered with the withered remains of the flower.

The commoner Docks have large, fleshy roots, tall stems 2 to 3 ft. high, and broad leaves rounded at the base. Their seeds are about one-tenth to one-twelfth of an inch long and light brown to reddish brown in colour. Seeds of Dock occur commonly in Red Clover and not infrequently in Trefoil, Crimson Clover and Wild White Clover. Sheep's Sorrel is a smaller plant with horizontally-spreading, stringy roots, and small leaves with pointed basal lobes. The seed of Sheep's Sorrel is about one-twenty-fourth of an inch long, reddish-brown or yellowish-brown in colour, somewhat translucent, and commonly surrounded by the withered flower remains. It is a fairly common impurity in Alsike and Timothy (especially North American samples), and is also found in White Clover and Red Clover.

CRANESBILLS.—The Cranesbills are species of the genus *Geranium* (Natural Order *Geraniaceæ*). They are low, straggling herbs, with branched stems, more or less divided leaves, and small, purplish flowers. The two commonest types are the Cut-leaved and the Soft Cranesbill.

The Cut-leaved Cranesbill or Robin is a branched annual with very dissected leaves. Its seeds are one-twelfth to one-sixteenth of an inch long, oval, greyish-brown, with markings similar to those of a thimble. It is a common impurity in English Red Clover, Crimson Clover and Trefoil. The Soft or Dovesfoot Cranesbill is also an annual, but it is smaller, less branched, and more hairy than Cut-leaved Cranesbill, and its leaves are less divided. The seeds are about one-twentieth of an inch long, oval-cylindrical, light chocolate-brown in colour, and quite smooth. It is a very common and troublesome impurity in White Clover seed, but is not much found in the other Clovers.

WILD CARROT.—(Natural Order *Umbelliferae*). The Wild Carrot needs little description as it is very similar to the cultivated form. It has, however, less root and leaf development, and more often behaves as an annual, forming seed the first year. The fruit ("seed") is practically indistinguishable from that of the cultivated carrot and occurs fairly commonly in Red Clover, more particularly, however, in samples which have been grown in France.

YORKSHIRE FOG.—(Natural Order *Gramineæ*). Yorkshire Fog is a tufted or slightly-creeping perennial grass, with greyish green leaves which are thickly covered with soft, velvety hairs. The flower heads are more or less spreading and almost always have a characteristic pinkish tinge. The form of "seed" which occurs so commonly in Rye-grasses is the flattened, oval spikelet, consisting of two chaffy glumes and the contained kernel. The "husked seed" is fairly common in Wild White Clover, and is also an impurity of Alsike and ordinary White Clover.

SOFT BROME GRASS.—(Natural Order *Gramineæ*). There are several closely allied forms which come into this group. They are mainly annuals with a tufted habit and slightly downy leaves. The spreading flower heads bear a comparatively few large spikelets. The awned boat-shaped seeds are very common in samples of Rye-grasses, but can be distinguished from seeds of Italian Rye-grass by the wider and more flattened top to the seed and the fact that the awn arises in a notch just below the apex of the seed.

Farmers who intend sending their seeds to the Seed Testing Station should comply with the following regulations:—

Size of Samples to be sent:—

Broad Beans and Scarlet-runner Beans	8 oz.
Peas and Dwarf French Beans	6 "
Wheat, Oats, Barley, Rye, Vetches, Red Clover, Crimson Clover, Trefoil, Lucerne, Sainfoin	4 "
Grasses, Alsike, White Clover, Mangolds, Beet, Turnip, Swede, Rape, etc.	2 "
All Vegetables, except Beet	$\frac{1}{2}$ "

Fees.—When the result of the test is required for the farmer's own information the fee is 3*d.* per sample; when the result is required for the purpose of making a declaration in respect of a sale the fees are: Cereals, 1*s.* per sample; Vetches and Vegetable seeds (except Mangolds and Beet), 1*s.* 6*d.* per sample; Mangold, Beet, Grasses and Clovers, 2*s.* per sample.

Envelopes.—Special envelopes may be obtained free of charge on application to the Director-General, Seed Testing Station, Food Production Department, 72, Victoria Street, London, S.W. 1, to which address samples should be sent.

USEFUL FARM WEEDS.

WINIFRED E. BRENCHLEY, D.Sc.,

Rothamsted Experimental Station.

THE useful properties of "weeds" and wild plants generally have long been recognised, and though with the progress of civilisation cultivated plants have tended to supplant the wild species, the latter have never quite fallen into disuse. At the present time, owing to the abnormal circumstances created by the War, the old uses are being revived and in various ways the weeds are helping to make up deficiencies of supply. Numerous experiments have been carried out since the War began, especially with bracken and heather, and the experience thus gained has been put to practical use. Bracken and heather cannot strictly be considered as farm weeds, and as they have frequently been dealt with in the pages of this *Journal* and elsewhere, it is proposed in the present article to draw attention to the uses of the more ordinary farm weeds, classified under their appropriate headings.

Medicine.—For many centuries wild plants played a chief part in the provision of medicines and drugs. In the early herbals almost every weed had special healing virtues attributed to it, many of which had little foundation in fact. With the advance in medical knowledge most of the wild "drugs" fell into disrepute, but a few retained their position in the *materia medica* of the day, though they were usually obtained from cultivated stock. At the present time there has been a revival in herb gathering, and there is a steady demand for the organised collection of certain species of such weeds, especially important ones being meadow saffron, deadly nightshade, foxglove, and henbane.

Dyes.—In the days before chemical dyes came into use, and before cheap vegetable dyes were imported in large quantities from foreign countries, wild native plants were the chief source of colouring matters. Yellow dyes were obtained from the tops of ladies' bedstraw (*Galium verum*) and agrimony (*Agrimonia eupatoria*), from the roots of nettles (*Urtica dioica*), and from dyer's greenweed or wood-wax (*Genista tinctoria*) and dyer's rocket (*Roseda luteola*), while the roots of sorrel (*Rumex Acetosa*) and ladies' bedstraw (*Galium verum*) provided red dyes. No general revival has taken place in the use of these plants, though they still seem to be used locally, especially in remote districts, as in the Highlands.

Poppy petals are valued on account of the fine red colouring matter they contain. This can hardly be classed as a dye, but it is much used as a colouring agent in pharmacy.

Fodder.—By far the most important uses of weeds are in connection with the food of men and animals, and considerable development has taken place in these directions during the last four years, especially with regard to substitute fodder plants. Weeds and weed seeds are being used as green fodder, hay and cake and are proving of much value.

Couch grass (*Agropyron repens*) was recognised as a valuable feeding stuff as early as 1804, when Hunter* stated: "Hogs, and I believe all kinds of cattle, will eat it greedily in its green state, and when dried it makes a very nourishing hay." As a matter of fact, horses and cattle eat it readily. Within the writer's experience in 1916 a rick of couch grass rhizomes was completely demolished by cattle that were turned into a field, though never a handful was fed to the beasts. If the couch rhizomes could be separated cheaply from soil and dirt they would furnish a very useful cattle food, as they contain both albumen and sugar. In recent German experiments† the stuff has been threshed and dried, forming couch hay, and it is claimed that this resembles good meadow hay in feeding value, yielding on analysis 10.37 per cent. crude protein, 4.93 per cent. digestible protein, 1.36 per cent. fat.‡ In Sweden it is used, after being dried and chopped up, for feeding pigs, and, as a variant, the food is prepared by boiling the couch with dandelion roots.

In this country spurrey (*Spergula arvensis*) is looked upon merely as a pernicious weed, but on the Continent it has long been known as a valuable fodder, and has been cultivated for the purpose.§ In 1787 Abbé de Commerell described the method of sowing spurrey on stubble directly after corn harvest, thus providing a plentiful supply of fodder within five or six weeks. Nowadays, two crops a year are raised in the Low Countries, the first from a May sowing which ripens seed in August, and the second from seed put down after rye harvest, which provides feed until the New Year. The crop is either used as pasture, or is cut and fed green or made into hay.

* Hunter, *Georgical Essays*, III., p. 134 (1803); VI., p. 176 (1804).

† Strecker, *Summ.* in this *Journal*, XXV., pp. 330-331.

‡ An earlier analysis gave 15.30 per cent. water, 7.15 per cent. nitrogen compounds, and 34.80 per cent. soluble feeding constituents (mucilage, sugar, glucose and other easily-digested materials). See Hughes, *Jour. Bath and West of England and Southern Counties Assoc.*, 1898, VIII. (1897-98), pp. 44-52.

§ See also full accounts in this *Journal*, XVIII., pp. 292, 1020; XIX., p. 214.

A giant variety is often sown, but our ordinary native species is the better as regards nutritive value. Spurrey is said to be particularly good as feed for milking-cows, as it improves their milk and butter, and it is much relished by horses, cattle, sheep, poultry and pigeons. The seeds of the plant, when bruised, provide yet another kind of useful food.

Experiments have been made in Germany* to test the feeding value of certain common weeds, with good results. Bindweed, (*Convolvulus arvensis*), fat hen (*Chenopodium album*), chickweed (*Stellaria media*), creeping thistle (*Cirsium arvense*), and sowthistle (*Sonchus oleraceus*) all have considerable nutritive value, especially for milking-cows, and no harmful effects have resulted from feeding them in quantity. It is suggested that when these weeds are used for feeding purposes they should not be cut too near the ground, in order to avoid the inclusion of dirt and stones. When dried these plants are credited with having a higher feeding value than red clover and lucerné, though they are not so nutritive when fresh. Bindweed seems to be the richest in food constituents.

Some years ago bent grass (*Agrostis stolonifera*) was grown rather widely as a fodder grass, but this is now less frequently the case. In Italy and the South of France it was a usual practice to gather the creeping stems into bundles, and to sell them in the market as horse provender.

Various other weeds play a useful, though minor, part in the provision of green fodder. Hogweed (*Heracleum sphondylium*) fattens hogs well, and is liked by cattle. Knot-grass (*Polygonum aviculare*) is greedily eaten green by pigs, so that in some counties it also receives the name of hogweed. An allied species (*Polygonum lapathifolium*) (a British species) was much used in Germany during 1914† and probably since, especially as a food for milch cows. No ill effects on the health of the animals have been observed, and, according to analysis, the food value approximates to that of rye-grass and cocksfoot.

Dandelion leaves and sowthistles are much appreciated by small stock, such as hares, rabbits and goats, and the leaves of silverweed (*Potentilla anserina*) are one of the favourite foods of geese. One old fodder plant, however, seems to have entirely fallen into disuse. Banister stated in 1799‡ that when large quantities of poppies appeared among wheat crops it

* Kling, M., *Landw. Versuchs-stat.*, LXXXV., pp. 433-470. See this *Journal*, XXII., p. 362.

† Störme und Klein, *Deutsche Landwirtsch. Presse*, 1914, No. 80, p. 890.

‡ Banister, J., *A Synopsis of Husbandry*, 1799, pp. 77-79.

was usual to turn in droves of hogs in May, thus making a clearance of the weed, but it is doubtful if this procedure is ever followed nowadays.

Some weeds are more useful after they are dried or made into hay. Most animals will not touch growing nettles on account of the stinging hairs, but after the plant is cut and dried these hairs collapse and lose their virulent property. In this condition they are readily eaten, and are said to improve the milk and butter of cows and to increase egg production in poultry. Nettles form a very useful crop for growing in waste ground that cannot be utilised in other ways, provided it is not too dry. They will resist considerable extremes of temperature, and three cuts a year can be taken. The Swedes have grown nettles for forage for many years and the composition is said to resemble that of the best meadow hay.

In France, Italy, Switzerland and other parts of Europe chicory (*Cichorium Intybus*) is cultivated for stock feed, especially for cows, and is usually made into hay. German experiments indicate that the dried chicory roots (chicory crumbs) make an excellent substitute for oats as they contain much carbohydrate, including over 4 per cent. of sugar. Horses may safely receive up to 10 lb. of the dried roots daily per head. Wild radish husks have also been used as stock feed by the Germans during the War. The nutritive value is about 40 per cent. that of good barley, and cattle and horses appreciate the husks, but they are not suitable for pigs.

Although gorse can hardly be considered as a usual farm weed it may be mentioned here that it forms a most excellent forage, provided that the older branches are bruised with a mallet before being fed. Cattle, milch cows, sheep and horses all thrive well on it, and in the Scilly Islands the gorse on the hills forms the chief means of subsistence for the island ponies.*

In the course of such farm operations as stacking and threshing large amounts of rubbish containing an abundance of weed seeds are apt to accumulate on a farm. In Canada enormous quantities of screenings are produced when the wheat is prepared for export, and special methods of crushing and separating have to be used to get rid of some of the weed seeds. Many of these screenings are considered to be useful for animal food, and this receives corroboration from German analyses. The seeds of black bindweed (*Polygonum convolvulus*) are very similar to those of buckwheat, and the resemblance extends to the feeding value. The seeds of various species of bedstraw,

* See also this *Journal*, August, 1915, p. 455. as to the use of gorse for fodder.

including *Galium aparine* and *G. tricornis*, are quite good as cattle food, but as they are so hard it is advisable to grind them before feeding. They contain 1 to 2 per cent. of oil, but it is difficult to extract this as it is so finely divided up in the tissues. Charlock seeds are also used occasionally, but are not altogether safe. It is said that they should be ground and cooked before feeding in order to avoid the danger of the formation of cumulative small amounts of oil of mustard in the stomachs of the animals.

The cake or residue left after the oil has been expressed from poppy seeds forms a nutritious food for cattle. Another cake is obtained in the same way from the seeds of gold of pleasure (*Camelina sativa*), but as it possesses acrid properties its suitability as cattle food is rather doubtful.

Human Food.—Many of the weed substitutes for fodder are so effective and so abundant that it is probable that their use will survive the immediate urgency of the moment. Most of the weeds used for human food, however, can only be considered as emergency rations, and it is doubtful whether the majority of them will continue in use when the present food shortage is over. The chief exceptions to this remark are chicory (*Cichorium Intybus*) and salep (*Orchis mascula*).

During the eighteenth century chicory roots were gathered for eating before the flowering stems shot up, and were sometimes dried and made into bread. Nowadays they are chiefly used as an adulterant or substitute for coffee, being kiln dried or roasted, and ground into powder. In Belgium chicory has long been used in a pure state instead of coffee, and in the same country the roots are boiled and eaten like parsnips. When bleached the leaves are used for salad.

“Salep” is a very nutritious food substance which enters largely into the diet of the people of Turkey, Persia and Syria. It is manufactured from the roots of *Orchis mascula*, which is an abundant weed in the moist meadows of Gloucestershire and other parts of England, and is much cultivated in the Orient. The root is heated and dried in the air, and the product is a rather horny substance, credited with containing much nutritious matter in a small bulk. It is occasionally added to bread in certain proportions.

In times of scarcity brought about by the failure of crops or the conditions of warfare the provision of a sufficiency of bread becomes one of the most pressing problems. The need for eking out meagre supplies of grain is urgent, and many and varied are the substitutes that have been tried with greater

or less success. In this country we have not been brought to such a serious pass, and we have been able to deal with the situation by utilising various types of grain and potatoes in addition to wheat. In other belligerent countries, however, there is no doubt that the difficulty is much greater, and many preparations of weeds, straw, and even wood have been tried as means of supplying the deficiency.

During the Thirty Years War the rhizomes of couch grass were dried and ground into meal for bread making, and this use has been revived in Central Europe during the last four years.* Even before the War bread made from common sorrel (*Rumex Acetosa*) was often used by the poor people of Sweden at times when it was difficult to grow an adequate crop of barley or rye.

The bitter, milky roots of sowthistle (*Sonchus oleraceus*) have been used similarly. The roots of silverweed (*Potentilla anserina*) are quite nutritious, and have provided a substitute for bread for the people of Tiree and Coll, who, in times of scarcity, have for months had to depend almost entirely upon them as a means of subsistence.

The seeds of some weeds can also be made into a flour substitute or addition. Spurrey seeds, ground and mixed with rye or wheat flour, make quite a good bread, and they are often used for this purpose in Norway and Finland, particularly if other crops are short. It is probable that the seeds of fat hen (*Chenopodium album*) might be employed in the same way. *Chenopodium quinoa*, a very closely-related species, has been cultivated for food purposes in Peru and Chili from very ancient times, and the seeds have been manufactured into flour. The relationship and the chemical composition of the two species are so close that there seems little reason why fat hen could not be applied to the same purpose. As a matter of fact, the Russians did make bread from rye flour and *Chenopodium* seeds during the famine of 1891-2, and it is probable that these were seeds of our own species *C. album*.

Some weeds that are useless as bread substitutes may help to supplement the vegetable supply, though with the great increase in allotment gardening in this country it has not been necessary to use wild vegetables to any appreciable extent. The Germans have apparently been making yet another use of the ubiquitous couch grass, by cooking the rhizomes like asparagus. In some parts of England, especially in the west around Bath, the spiked Star of Bethlehehm (*Ornithogalum pyrenaicum*) is

* In Italy a starchy powder has been prepared from the rhizomes of couch grass, which closely resembles arrowroot, and can be used satisfactorily for human food. See also note in this *Journal*, June, 1918, p. 330.

very abundant, and is gathered and sold in the local market for use instead of asparagus, and is much esteemed. Earthnut (*Conopodium denudatum*) is another of our common pasture weeds that might be worth developing, as it is both nutritive and palatable, though it is little known and much neglected. The tuberous roots were eaten by the Dutch people in the seventeenth century as we eat parsnips and carrots. They are still so eaten in Holland and the Alps, and are said to resemble chestnuts in flavour. In parts of England they are sliced and put into soups, while in Sweden they are widely used and are indeed a regular article of commerce. If cooked like Jerusalem artichokes they are very palatable and easily digested. It has been suggested that even if earthnuts are not directly consumed as food, they might prove a remunerative source of starch or glucose.*

The tops of young nettles and also of wild garlic (*Allium ursinum*) make excellent substitutes for spinach, though the latter needs to be thoroughly scalded twice to remove the strong garlic smell. The Germans have been experimenting since the outbreak of War with nettles and have now begun to cultivate them as food.

Substitutes for tea and coffee are many. Some of them have been known and used in out-of-the-way country districts for many years, but the cessation of imports into Germany has brought them into prominence. Chicory is a permanent substitute and has been described above. Once again couch grass is used, the rhizomes being washed, dried, and minced before roasting and grinding. The roots of dandelion, sowthistle, John-go-to-bed-at-noon (*Tragopogon pratensis*) and bracken are all treated and used in a similar way, and in Germany a new company has even been formed to promote the use of the roots of reeds as a coffee substitute.

For tea the leaves of meadow-sweet (*Spiraea ulmaria*), ground ivy (*Glechoma hederacea*), agrimony (*Agrimonia eupatoria*), sweet vernal grass (*Anthoxanthum odoratum*), and the flowers and calyx of cowslip (*Primula veris*) have all been used at different times and places. The leaves of the narrow-leaved willow herb (*Epilobium angustifolium*) have long been used in Russia for mixing with ordinary tea.

Manures.—When weeds have to be removed from the land the problem arises as to the best way of disposing of the rubbish, as if it is pulled up and left lying about it becomes a nuisance

* Crichton Browne, J. A Neglected Source of Food Supply. 1917. *Salborne Magazine*, XXVIII., pp. 85-87.

and a menace. A simple way out of the difficulty is to bury the material, utilising it as a green manure, and this practice has been very generally followed throughout the history of agriculture. When a weedy stubble or fallow is ploughed up the weeds are buried some inches deep, and they decay and return their valuable plant foods to the soil. On light, sandy soils a useful method of eradicating spurrey is to turn it in, with much benefit to the soil; in fact some foreign writers recommend that it should be sown for the purpose. German analyses of such common weeds as bindweed, chickweed, fat hen, sowthistle, etc., have shown that many of them are rich in plant food, especially nitrogen and potash. Chickweed and fat hen contain a very large proportion of potash (10·9 per cent.), so that they have a considerable manurial value.

When large quantities of weeds are gathered by the harrow it is unwise to leave them scattered by the side of the field on account of the danger of seed dispersal. If it is possible to cart them away, they may be mixed with lime, and will then rot down into a useful compost that will supplement the supplies of farmyard manure. A still better plan, if it can be carried out, is to burn the weeds straightway in heaps on the field and to spread the ashes over the land. This conserves the valuable potash to a great extent, and the soil is correspondingly benefited. Couch grass is very useful when treated thus. Its composition varies with the soil on which it grows, and, generally speaking, the richer the soil the richer the ashes. On sandy land that is infested with bent grass (*Agrostis* sp.) it is the usual practice to harrow it into heaps and burn it.

The ashes from burnt gorse are very rich in alkali and are valuable as manure, especially on peaty soil.

Fibre Plants.—A few weeds have some economic value on account of the fibre they contain, the common nettle being the most important of these. The stems contain a large proportion of fibre, and at different times and places this has been utilised to manufacture all kinds of material ranging from ropes and cordage to the finest white linen and sewing cotton. The ancient Egyptians used it a great deal in the manufacture of textile fabrics,* and it is probably still made into cloth in parts of Italy, while the inhabitants of Siberia depend upon the nettle for their supplies of fishing lines and cordage. This use of nettles has been revived in recent years, as in 1911 a Vienna firm discovered a practical way of removing the gum from the

* Hogg, R., and Johnson, G. W. : *Wild Flowers of Great Britain*, 1863.

fibre of *Urtica dioica* and *U. urens*, enabling a yield of about 13 per cent. of pure bleached fibre to be obtained from the plants. It is claimed that the fibre is supple and flexible, with a gloss like that of silk.

The stems of gold of pleasure (*Camelina sativa*) are very tough and fibrous, and in countries where it is abundant or cultivated they are utilised for such purposes as thatching and for making brooms, sackcloth, sailcloth and packing paper. The common rushes of our damp fields have fallen into disuse, but in this country mats and chair bottoms were formerly manufactured from them; they were worked up into baskets of all descriptions, from coarse fishing baskets to finely woven ware, and the pith provided material for making "rush lights" before the modern candle was introduced.

Recent experiments have shown that the fibres from the rhizomes of couch grass are quite suitable for paper-making if the initial difficulties with regard to the expense of collection and cleaning can be overcome.

Miscellaneous Uses.—The screenings from large bulks of wheat often contain large quantities of seeds of fat hen and charlock, the latter being rich in oil, and it has been suggested that these might make a profitable fuel if they were mixed with coal. Gorse is often used in country districts to heat the large brick ovens, as it is easily obtained and burns with a great heat.

The various species of horsetail have a deposit of silica in their outer layers, which makes them valuable as scouring agents. Both in this country and America, and probably elsewhere, the horsetails are used for polishing tin ware and brass, and one special variety, under the name of Dutch rushes, was imported into this country as it is particularly good for the purpose. Another rustic use of a weed, common to England and Sweden, is to employ the rough stems of goosegrass (*Galium aparine*) as a filter for straining milk. In the manufacturing world, too, the mucilage from the seeds of various species of plantains (*Plantago* sp.) is valued for stiffening muslins, while the seeds of fat hen are used in the manufacture of shagreen to give the pitted appearance characteristic of that leather.

From this outline sketch of the uses of farm weeds it is seen that these plants, generally regarded as useless encumbrances of the ground, may take a definite place in the economics of the country if they are utilised in the right way. The most promising outlook is with regard to forage, and while many uses are almost certain to fall into abeyance as soon as

conditions become more normal, it would be advantageous if some of the more valuable weeds were to retain their position as fodder plants long after the War is over.

ECONOMY IN THE USE OF HAY.

The Need for Economy.—The great extension of the area devoted to the grain and potato crops this year has involved serious inroads upon the area of grass land which would otherwise have been used for the production of hay. The hay area (permanent grass and rotation grasses) in England and Wales this year is 731,000 acres less than in 1917, and it is probably not far wide of the mark to say that this year's hay crop in England and Wales is fully 800,000 tons short of last year's, and 1,100,000 tons short of the average crop for the past ten years.

In the face of the foregoing figures, and the increase over pre-war requirements occasioned by the needs of the Army, it is obvious that the most rigid economy in the use of hay will need to be practised *all round* throughout the coming winter. To the farmer with a short crop of hay the need for economy will be sufficiently obvious, and it will be brought home more and more sharply to all as the demands of the Military Authorities make inroads upon the supplies of those more fortunately circumstanced.

Farmers are often reluctant to part with their hay because they do not consider they can replace it by any other food so cheaply. But now that hay is £8 per ton the farmer who can obtain offals or cake under the rationing scheme for feeding stuffs will not find it profitable to attempt to do all his feeding on hay. These concentrated foods have twice the feeding value of hay and to the extent they are procurable at prices under £17 a ton they are cheaper than hay at £8 a ton. The further reason why farmers should market as much of their hay as possible is that town horses are more dependent on hay than farm horses, inasmuch as substitutes can more readily be found in the latter case. It is estimated that if every consumer of hay could reduce by one-fifth the quantity fed to his stock last year, sufficient hay would be saved to supply the entire needs of the Army and town transport horses.

How to Secure Economical Use.—Hay is chiefly used for indoor feeding, so that the first measure for securing economy is to

reduce the indoor feeding period to the narrowest possible limits. Cattle should not be housed in the autumn until the condition of the pastures or other considerations make it obviously desirable. In this connection the outdoor wintering of store stock which is profitably practised in many districts should receive wider consideration.

It has been a matter of common observation in the past that on many farms much waste of hay has taken place owing to lack of care in the methods of feeding it to stock. In some cases the waste has been occasioned owing to the feeding arrangements permitting a good deal of hay to get under the feet of the animals and consequently become unfit for feeding.

This waste is reduced when the hay is fed from suitable racks. On the other hand the loss is greatly aggravated when, as not infrequently happens, especially in these days of shortage of labour, the amount of hay given at a foddering is more than the animals can readily consume. In such cases the wastage on the floor is greatly increased, and the surplus remaining at the next foddering is frequently so spoilt that it has to be thrown out for litter or manure. Such excessive foddering of hay is bad practice at any time, and is especially undesirable under present conditions. The amount given at one foddering should not be more than the animal will consume in an hour or so.

Still greater economy can be effected, though with enhanced labour, by feeding as much as possible of the hay in the form of chaff, preferably in admixture with a certain amount of concentrated food or pulped roots. In the case of cattle and sheep it is generally thought desirable that a fair proportion of the hay (or straw) should be given long to ensure satisfactory "cudding," but with reasonable care a considerable amount of chaff can be fed.

By far the most effective method of economising hay supplies is to use them mainly as a supplement to straw for all stock capable of consuming straw effectively. It is particularly desirable that this practice shall be extensively followed during the coming winter, since it secures the double advantage of economising our deficient supplies of hay and of utilising in the most effective way our relatively large supplies of straw.

The merits of the different kinds of straw for feeding are dealt with in detail in Food Production Leaflet No. 20. Generally speaking, wheat straw is the least nutritious, and can only be used for feeding to a very limited extent. Sound

oat and barley straw, on the other hand, are valuable fodder for cattle, sheep and horses, their nutritive value being commonly fully one-half that of good meadow hay or even higher for the feeding of store stock. The better qualities of oat straw and barley straw containing clover are also useful at certain seasons for sheep. In so far, therefore, as adequate consumption can be secured, hay may be replaced by fodder straw in the proportion of roughly two parts of straw for one part of hay. This replacement involves a reduction in the supply of albuminoids, but this is probably only of practical consequence, however, in the case of cows in milk. The addition of 1 or 2 lb. of concentrated food per stone (14 lb.) of straw used will remedy any deficiency in this respect. Where bean or pea straw of good quality is used as fodder in place of hay no such difficulty arises as it is richer in albuminoids than cereal straws. Oat straw should be reserved for feeding and should not be used for bedding purposes except where no substitute is available.

A little difficulty is often experienced in inducing stock to eat straw along with hay, especially if both be given in the long state. For this reason, and with a view also to reducing waste, it is probably best, as a general rule, to feed the hay in the form of chaff containing a proportion of straw. Chaff mixtures containing up to two-thirds of their weight of straw will be readily eaten. Full use should be made of cavings as well as straw.

Where the straw is not of the best quality, it may be desirable to subject it to preliminary treatment before use with a view to making it more palatable. Various methods which have been used for this purpose are dealt with in the leaflet referred to above.

In replacing hay by straw some regard should be paid to the demands placed upon the animals. Thus, in the case of horses, the proportion of straw used should be greater in periods of light work than at times when the work is heavy. In some districts it is, indeed, the practice to maintain horses with no other coarse fodder but straw. Similarly, in the case of milch cows, the replacement of hay by straw may be steadily increased as the flow of milk shrinks.

Finally, the possibility of overcoming the fodder shortage by an increased production of arable fodder crops for soiling or silage should not be overlooked (see Leaflet No. 9 and Food Production Leaflet No. 51). A modification of existing farming practice with this end in view will go a long way to render

the farmer independent of both the hay crop and the root crop and make his future farming operations far less dependent on the vagaries of the weather.

Copies of the leaflets referred to above and other leaflets bearing upon the subject of fodder supplies can be obtained free on application to the Secretary, Board of Agriculture and Fisheries, 3, St. James's Square, London, S.W.1.

(This article is also issued as Food Production Leaflet No. 59. Copies may be obtained free of charge and post free on application to the Secretary, Board of Agriculture and Fisheries, 3, St. James's Square, London, S.W. 1. Letters of application so addressed need not be stamped.)

FLOODS AND WATERLOGGED LAND: THE LAND DRAINAGE ACT, 1918.

1. **The Need for Arterial Drainage.**—There are estimated to be in England and Wales something like a million acres which, by the improvement of arterial drainage, might be either brought into arable cultivation or greatly increased in value as grass land. In view of the urgent need at present existing, and likely to continue to exist for some years at least, of utilising for the purpose of food production every available acre of land, this brief summary of the changes made and facilities afforded by the new Land Drainage Act has been prepared for the information of local authorities and of all persons interested in the land.

2. **Previous Difficulties in Dealing with the Matter.**—Private efforts, having in view the prevention of floods and the more efficient drainage of agricultural land, have often been attended with little success, as the endeavours of energetic owners and tenants have been neutralised by the failure of others to carry out work essential to proper drainage, and difficulties have arisen in securing combined action by the whole of those concerned. These difficulties have been especially apparent where the owners and occupiers of the land have amounted to any considerable number.

In many places Commissions of Sewers have been established for centuries; in others, drainage authorities have been constituted under local Acts; and a number of Drainage Boards have been set up under the Land Drainage Act, 1861. The

total area dealt with is, however, small compared with the large area of floodable and waterlogged land capable of improvement in the country. In many instances also the drainage districts have been formed with a view to isolated areas and without any provision for co-ordination between the drainage authorities exercising jurisdiction in the same river basin.

In the past, there have been two chief obstacles to the setting up of Drainage Boards. First, it was necessary, before the Board of Agriculture and Fisheries could set up a Drainage Board for any area, that a petition should be received by them from the owners of not less than one-tenth part of the acreage affected. Consequently, where the owners of any area requiring drainage were apathetic in the matter, neither the Board of Agriculture and Fisheries nor any other body could initiate proceedings. Again, in the event of a Provisional Order being drafted by the Board the assent of the owners of two-thirds of the area was required before any further step could be taken, and the trouble and expense involved in obtaining consent in cases where many owners were concerned often discouraged persons who would otherwise have initiated proceedings.

A further impediment to speedy procedure under the Act of 1861 was the requirement that any Order made by the Board setting up a Drainage Board, even in those cases where there was no opposition, should be inoperative until confirmed by Parliament.

3. Difficulties Removed by the Act of 1918.—The Land Drainage Act, 1918, is intended to facilitate the establishment of Drainage Boards, to render possible a revision of drainage areas so as to suit modern conditions, and to assist in various other ways the renewal and extension of arterial drainage.

4. Establishment of Drainage Boards.—Part I. of the new Act (Sections 1 and 2) considerably modifies procedure for these purposes. An Order constituting a separate drainage district may now be framed by the Board on receipt of a petition from the owners of one-tenth of the proposed area (as formerly), or from the council of any county or county borough in which any part of the land proposed to be affected by the Order is situate, or the Board may themselves initiate proceedings for such an Order. After due notice has been given, copies of the Draft Order deposited, objections considered, and, if necessary, a local inquiry held, the Board may proceed to settle the Order unless within a prescribed period the owners of one-third of the proposed district signify their objection to the making of the Order, in which case the

Order cannot be made. The Order, when settled, becomes operative after 30 days' notice, unless within that period a memorial against it is presented to the Board, in which case (unless the memorial is withdrawn) the Order requires the confirmation of Parliament.

If the Order comes into force the expenses of obtaining it are, under Section 3, made a first charge on the rates of the district constituted by the Order. If the petitioners do not obtain the Order, they are required to pay the expenses.

5 Alteration of Boundaries.—The boundaries of an existing drainage area may be extended or altered (by a similar procedure) with the consent of the drainage authority for the area, and the petition may emanate from that authority.

The limits of a Commission of Sewers may be defined on the petition of the Commission.

6. Powers to Transfer to County Councils.—Provision is also made (Section 1 (2)), for the transfer, subject to certain conditions, on the petition of a county or county borough council, to such council of the powers, duties, property and obligations of drainage authorities exercising jurisdiction within the counties or county boroughs; such a transfer may also be made to a joint committee of county and county borough councils where the drainage area is within the jurisdiction of more than one council. The expenses incurred by a council as the drainage authority are to be defrayed under the transferred powers, and not out of the council's rates or funds.

The expression "drainage authority" is defined in Section 13 and includes Commissions of Sewers, Drainage Boards, and any body of persons authorised by a Local Act or Award to make or maintain works for the drainage of agricultural land.

7. Increase of Rating Powers: Limit of Rates.—In many instances a drainage authority is hampered in the execution of necessary works by a limit of rates which is inconsistent with modern conditions or by some other disabling or inadequate provision; to meet such cases the Act empowers the Board to confer upon a drainage authority additional powers of levying rates and borrowing, and of altering or supplementing the provisions of any local Act or award from which its powers are derived, where this is found necessary or expedient for the purpose of effective drainage (Section 1 (1)).

The petition for the Order may be presented by the drainage authority, or by the council of any county or county borough in which any part of the drainage area is situate.

8. Other Provisions as to Rating.—Section 4 removes any doubt as to the power of a Commission of Sewers, or a Drainage Board constituted under the Land Drainage Acts, to levy rates on the basis of acreage, and validates rates levied on that basis whether before or after the passing of the Act; but does not prohibit rating on the basis of annual value. The same Section enables an Order to provide for differential rating of a part of a drainage area or for total or partial exemption of buildings, railways, canals, inland navigation or any other special class of land.

9. Contributions by Urban and Rural Authorities.—Section 5 empowers local authorities, with the concurrence of the Local Government Board, to contribute to the expenses of drainage authorities where drainage works are desirable in the interests of the public health or for the protection or better enjoyment of highways.

10. Combination of Drainage Authorities.—Under Section 6, any drainage authority can make arrangements with the drainage authority of an adjoining area for the execution of works in the latter area on such terms of payment or otherwise as may be agreed.

11. Navigations: Power to Transfer to Drainage Authorities.—Section 7 provides under certain conditions for the entry of drainage authorities and navigation authorities into arrangements for the execution of necessary drainage works; and for the transfer to a drainage authority of the whole or any part of the undertaking of a navigation authority. This power may be of value in cases where the remains of obsolete navigation works form an obstacle to an effective drainage scheme.

12. Outfalls Outside Drainage Areas.—Section 8 enables drainage authorities to execute works outside their district under the same procedure as exists under the Land Drainage Act, 1847, and Part III. of the Land Drainage Act, 1861, for enabling persons interested in land to secure outfalls for their drains.

13. Annual Returns.—Section 9 requires every drainage authority to send to the Board of Agriculture and Fisheries annually, before a date which will be fixed by the Board, a report of their proceedings during the previous year. The form of report will be prescribed by Regulation.

14. Power to Invest on Security of Rates.—Section 12 authorises owners of land in a drainage area, who have power to invest money on real security, to invest money on a first mortgage of the drainage rates leviable in the area.

15. New Powers Conferred upon the Board.—Part II. of the new Act confers on the Board of Agriculture and Fisheries powers of considerable importance to secure the due performance of duties and obligations with regard to arterial drainage, and to arrange for the arterial drainage of small areas; these powers are summarised in the following paragraphs.

16. Power to Enforce Carrying out of Duties and Liabilities.—Under Section 15 of the Sewers Act, 1833, where a person or body liable to maintain works affecting drainage has failed to do so, an officer appointed by a Court of Sewers is empowered to execute any needful repairs and recover the expenses incurred from the person or body liable. This power may now be exercised under Section 15 (1) of the new Act by any officer appointed by and acting on behalf of the Board of Agriculture.

Section 15 (2) empowers the Board to exercise drainage powers conferred by any general or local Act or any Order or Award or by any Commission of Sewers, which are not being exercised or are being insufficiently exercised. This Sub-section enables the Board of Agriculture, if any drainage authority fails to maintain efficient drainage, to carry out the necessary work in place of the authority and to recoup their expenditure by the exercise of the authority's rating and borrowing powers. It also enables the Board to enforce the drainage provisions of Inclosure Awards.

17. Drainage Schemes for Small Areas.—In Section 16 provision is made for dealing with the drainage of areas of land capable of improvement which cannot be conveniently dealt with under Part I. of the Act. Where the Board of Agriculture are of opinion that any such area is capable of improvement by drainage works, and that the expenses of executing and maintaining the works will not exceed the increase in the value of the land arising therefrom, they may prepare a draft scheme detailing the area to be improved, the proposed works, the estimated cost of their execution, the maximum amount recoverable by the Board in respect of such cases (not to exceed £5 per acre, or £5,000 in all), and the manner in which the expenses of executing and maintaining the works are to be apportioned amongst the lands in the area. The draft scheme is to be deposited for inspection, and notices given to the owners and occupiers of land in the area, and to other bodies and persons interested, so that

objections may be made and considered before the scheme is finally settled. For the purpose of executing and maintaining these works, the Board have, within the area concerned, all the powers of a Drainage Board, and the expenses of execution (up to the maximum stated in the scheme) and of maintenance are recoverable by the Board in a summary manner, subject to the proviso that, if an owner so requires, the sum payable by him may be payable by instalments in the same manner as in the case of a private improvement rate for private improvement expenses incurred by a Local Authority under the Public Health Act, 1875.

18. **Delegation of Powers.**—The Board of Agriculture have power under Section 17 to delegate any of their powers under Part II. of the Act to bodies constituted in accordance with the terms of that Section.

FORMS IN WHICH PETITIONS UNDER THE LAND DRAINAGE ACT, 1918, MAY BE MADE.

BOARD OF AGRICULTURE AND FISHERIES.

Land Drainage Acts, 1861 and 1918.

Petition for the Constitution of a Separate Drainage District.

(Strike out paragraphs and words not applicable.)

County of
We, the undersigned, proprietors, within the meaning of the Land Drainage Acts, 1861 and 1918, of at least one-tenth part

or

We, the council of the administrative county of or county borough of....., in which are certain lands which form part of an area containing acres or thereabouts which is drained by such part of the (1) as lies between (2) and or by the tributaries or drains connected therewith, and is capable of being benefited by the maintenance or improvement of such river, tributaries or drains, hereby petition the Board of Agriculture and Fisheries to constitute a separate Drainage District under the provisions of the said Acts, comprising such lands as are capable of being benefited by the maintenance or improvement of such river, tributaries or drains.

(1) Name the main river or channel draining the area.

(2) Define the portions of the river or channel referred to by naming the points up and down stream at the ends of these portions.

NOTE—The Order will require the consent of the Drainage Authority if any exists.

The said lands are believed to be in no district of an existing drainage authority or Parts of the said lands are believed to be in the district of the following Drainage Authority :—.....

Signature and Address of Proprietor.*	Number of Acres in the Proposed District of which he is Proprietor.	Name and Address of Witness to Signature.

* For definition of "Proprietor" see Section 6 of the Land Drainage Act, 1861.

BOARD OF AGRICULTURE AND FISHERIES.

Land Drainage Acts, 1861 and 1918.

Petition for the Alteration of the Boundaries of a Drainage Area.

(Strike out paragraphs and words not
applicable.)

For definition of "pro-
prietor" see s. 6 of the Land
Drainage Act, 1861.

County of.....
We, the undersigned, proprietors within the
meaning of the Land Drainage Acts, 1861 and
1918, of at least one-tenth of the lands described
in the Schedule hereto

or
We, the council of the administrative county
of..... or
county borough of.....
in which are situate the lands or some of the
lands described in the Schedule hereto

or
We, the..... being the
drainage authority of the drainage area known
as the

being desirous that the lands described in the
Schedule hereto should be included within (or
excluded from) the drainage area known as
.....and under the jurisdiction of the
.....
hereby petition the Board of Agriculture and
Fisheries to make an Order under the said Acts
for the alteration of the said drainage area
accordingly.

Signature and Address of Proprietor.	Area of Scheduled Land Owned by the Proprietor.	Signature and Address of Witness.

SCHEDULE.

Lands proposed to be added (or, excluded).

The description may be by O.S. numbers or by a map attached.

NOTE.—The Order cannot be made without the consent of the Drainage Authority.

BOARD OF AGRICULTURE AND FISHERIES.

Land Drainage Acts, 1861 and 1918.

Petition for the Definition of the Limits of a Commission of Sewers.

We, the Commission of Sewers for..... acting under a Commission issued on the of..... 18..... being desirous that the limits of the jurisdiction of the said Commission should be defined under the provisions of the Land Drainage Acts, 1861 and 1918, hereby petition the Board of Agriculture and Fisheries to make an Order under the said Acts defining the said limits.

BOARD OF AGRICULTURE AND FISHERIES.

Land Drainage Acts, 1861 and 1918.

Petition for the Alteration of a Local Act or Award.

(1) Give particulars of the Local Act and Award (if any) under which the Drainage Authority act. We..... the drainage authority acting under (1).....

or

(2) Act and Award.
or

We, the council of the administrative county of or county borough of..... in which is situate (part of) the drainage area under the jurisdiction of the drainage authority acting under (1)..... being desirous that the provisions of the said (2)..... should be altered or supplemented in the respects indicated in the Schedule hereto so as to enable the area for the benefit of which drainage works are authorised by the said (2)..... to be drained effectively, hereby petition the Board of Agriculture and Fisheries to make an order under the Land Drainage Acts 1861 and 1918 for altering or supplementing the provisions of the said (2)..... accordingly.

SCHEDULE.

The Schedule should indicate the proposed alterations as fully as possible, but need not contain the precise terms of the amendments desired.

(This article is also issued as Food Production Leaflet No. 56, copies of which may be obtained free and post free on application to the Secretary, Board of Agriculture and Fisheries, 3, St. James's Square, London, S.W. 1.)

IN this *Journal* for January, 1917 (p. 963), was published an article on the Croydon Vacant Lands Cultivation Society.

**The Croydon Vacant
Lands Cultivation
Society.**

The Society have recently issued their Third Annual Report for the year 1917-18, in which is given an account of the operations of the Society since its inception in September, 1914, and the following particulars are taken therefrom :—

A few days after the outbreak of the War, the unoccupied lands of the Croham Park Estate at Croydon were offered rent free by their owner, a well-known Croydon land owner, for cultivation by those willing to undertake the work. A committee was formed to make all necessary arrangements respecting this land, and it was decided to form a society for the purpose of carrying out the management. An undertaking was given to vacate possession if the owner should subsequently require the land, compensation in this case to be made to the occupiers for any loss of crops. More land was then secured, part of which was soon let.

During the next two years all vacant land in the county borough was sought out and registered; and where ownership could be traced the owners were urged to lend their land to the Society. A good deal of diffidence was experienced on the part of those who were in a position to give information, but help was afforded by official departments, and on the whole the response was gratifying.

All services were voluntary, an office was lent to the Society by the Guild of Help, a subscription of 4s. per plot was paid by the plot-holders, raised later to 5s., of which 4s. was carried to a compensation fund for the purpose of giving compensation to those plot-holders whose land was given back to owners without the plot-holders being able to obtain the full benefit of their crops and outlay on the land. By means of strict economy the total working expenses for the first two years (during which 995 plots were let out), amounted to only £35, and were met by voluntary donations.

In December, 1916, the Croydon Corporation were empowered by the Board of Agriculture under the new Defence of the Realm Regulations to undertake the cultivation of vacant land in the borough. The Committee of the Croydon Vacant Lands Cultivation Society agreed with the Allotment Committee of the Corporation to do all they possibly could to cultivate 61 acres, or 790 plots of vacant land upon which the

Corporation were entering. The land acquired was let at an annual subscription of 5s. for each 10-rod plot.

As a result of the national allotment movement, which was started early in 1917, there was an increased demand for allotments in the district. Applications for land were received at the rate of about twenty a day, and many persons volunteered their services, both in the work of letting the plots to applicants and in supervising subsequent operations. Later in the year, the Borough Council acquired further powers to enter occupied land, and about 65 acres or 850 plots, were let to the Society at various rentals up to £3 per acre, and all land thus rented by the Society was quickly taken up by allotment-holders.

Comparing the position of the Society at the end of the year 1917 with the position at the end of 1916, the area of land secured by voluntary agreement was about 176 acres (let in 2,377 plots) as against 68 acres (995 plots) at the end of 1916. This area includes the land at Wallington and Purley. Since then the Purley Branch has separated and formed itself into a separate society.

The policy of the Committee has been two-fold: (1) to use the funds of the Society for the cultivation of vacant and neglected land in order to increase the food supply of the district, and (2) to decentralise as far as possible, so that the plot-holders on the various estates might be persuaded to manage their affairs themselves. It is only recently that the latter plan has begun to bear fruit, and there are now no fewer than 6 registered societies and 8 unregistered which have been formed to look after the interests of different groups of plot-holders.

The success of the Committee was well exemplified in the excellent results which were obtained by plot-holders at the Croydon Flower Show, the prizes at which were generously provided by an anonymous donor.

Early in January, 1918, the Croydon Corporation gave notice of their intention to resume possession of the land already entered upon by them and to enter into possession of some of the land which has been let to the Society by the owners; and to make such land over to plot-holders' associations, recently formed and in contemplation. Accordingly, a list of the Society's lands entered by the Council, and handed over to the various small societies, consisting of about 1,700 plots, was submitted to the Committee. This still left some 630 plots on 70 different holdings under the management of the Committee. They agreed to cultivate this land to the

fullest possible extent and to acquire any additional land which might become available. Their efforts in this direction have from 1st January, 1918, up to the date of the Third Annual Report, resulted in the addition of 115 plots, covering about 20 acres, and there is still a large demand for such land.

The accounts of the General Fund for the year 1917, show the income of the Society to be £541 8s. 1d., in which is included £21 6s. 1d. as the balance in hand on 1st January, 1917, and £493 1s. 9d. in respect of subscriptions from the plot-holders. The expenditure amounted to £457 12s. 9d., the principal items being: rents of land, £167 1s., office, etc., £20; cost of labour, notice boards, fences stakes and drainage, £79 14s. 9d.; outlay on spraying less repayments, £21. Honorarium to the secretary, £105. The balance in hand at the end of the year 1917, was £84 5s. 1d.

In addition, the amounts to the credit of the compensation fund, including the Purley and Wallington branches, and, including £153 balance from 1916, amounted to £505, which was dealt with by payment of £56 to Purley on its becoming a separate society, and of about £200 to the new societies (about fourteen in number) in respect of the members taken over by them, and by retaining for the new compensation fund in respect of the plots remaining with the Society £136, the Wallington Branch £60, and 3d. per share for the general expenses fund of the Society.

EVERYONE is familiar with cases in which certain individuals are only too willing to live at someone else's expense, and we all know how difficult such individuals are to get rid of and how desirable it is to get rid of them. Among

**Parasitic Mange
in Horses:
Practical Advice to
Horse Owners.***

all living creatures there exist certain classes generally small and insignificant to look at which have adopted this mode of living. These we call parasites, and their mode of living is called parasitism.

During the last two or three years certain parasites of this kind have adopted the horse as their unwilling host to such an extent that horses all over the country are affected with the diseases caused by their presence, and since it is impossible for a horse badly infected with these unwelcome guests to keep in good health, let alone perform its work efficiently, horse owners will recognise the importance of keeping horses free from parasites.

* See also article printed in this *Journal*, August, 1918, p. 581.

As the result of trials carried out by the Veterinary Department of the Board of Agriculture, a method of treatment has been evolved which will enable the horse owner to free and keep free his horses from these parasites, and all horse owners will follow with interest the extracts from a lecture given by Sir Stewart Stockman, Chief Veterinary Officer to the Board of Agriculture, on 1st August, 1918, showing how this can be done. The following are extracts from the lecture :—

External parasitism, of which the most serious is mange, is of great importance to horse owners and to the State at the present moment. During the last two years its prevalence has greatly increased.

Need for Co-operation among Horse Owners to Overcome the Disease.—These diseases can only be successfully combated by the owners of the animals. If they will not co-operate in curing and preventing mange and such diseases, no administrative order can have any material effect. It is their duty to the State at the present moment ; it is also their duty to the animals which suffer, and on personal grounds it is well worth owners' attention, since mange will seriously diminish the usefulness of their horses and greatly reduce their value. Mange may even cause considerable mortality in neglected cases.

Why the Disease Spreads.—The reasons for the increase are : Short rations, shortage of labour, and reluctance to report cases to the Authorities. None of these reasons, however, constitutes a good excuse for mange being allowed to spread. External parasitism need not spread under such conditions if the parasites are destroyed, and good opportunities for destroying them are provided when they are congregated on their hosts as at present.

Sympathetic Government Attitude.—The amending Mange Order which has recently been issued by the Board of Agriculture recognised the difficult position in which a horse owner may be placed if his horses are suffering from mange, and if he is entirely prevented from making use of them on account of mange. The Order allows affected horses, and those in contact to be worked under certain conditions which are exceedingly reasonable, namely, that they must be treated regularly in such a way as will effect their cure, and during the curative process render them harmless to other animals. There is no excuse, then, for neglecting to report cases of mange. Indeed, it is highly foolish on the part of an owner not to do so, since the Authorities are only anxious to be brought in contact with the outbreak in order to have the opportunity

of giving further instructions to owners as regards the best method of bringing the outbreak to an end. The shortage of labour for purposes of treatment can easily be got over by a mechanical method of applying treatment which will be demonstrated at the close of this address. It is not only an easy and labour-saving method, but it is exceedingly cheap, and should not cost more than 2d. or 3d. per application of dressing to the whole body. The treatment against one kind of parasite will destroy other kinds on the skin.

Something Important about the Unwelcome Guest.—Mange is a disease caused by external parasites known as acari, and since the parasites can pass from one animal to another directly or through the medium of stable tools, harness, litter, infected stalls, etc., it is contagious. There are two principal varieties of mange which are caused by different but related parasites. There is Sarcoptic Mange, caused by the Sarcoptes; and Psoroptic Mange, caused by the Psoroptes. The Psoroptes live on the surface of the skin, and, as a general rule, are easily got at by suitable remedies. On the other hand, the female Sarcoptes burrow beneath the superficial layers of the skin, and lay their eggs in dug-outs, as it were, where the young hatch. On this account the parasites are more difficult to get at, and this form of mange is somewhat harder to cure. It is quite curable, but requires more persistent treatment. To understand curative measures it is necessary to explain some points in the life history and habits of the parasites. The adult females lay eggs. *These eggs hatch out and produce larvæ in from four to six days*; that is an important point to remember in relation to treatment. Another important point is that the larvæ take from eight to ten days to become adults, at which stage they can lay a fresh crop of eggs. The parasites themselves can be destroyed more or less easily by dressings. The eggs are more difficult to destroy, though some dressings are better in this respect than others. This brings us to the subject of treatment and prevention.

Methods of Treatment and Prevention.—Details of treatment are described in a printed leaflet which I have prepared for issue by the Joint Committee of the Board of Agriculture and the Ministry of Food.* It is unnecessary, then, to go into details in this address, since it can be read in the leaflet. The dressings and appliances will be demonstrated at the close of this address, but full information regarding them can be obtained from the Public Control Department of the London County

* See p. 976.

Council and from the various War Agricultural Executive Committees. It may be said that, whereas all these dressings are to some extent irritating, it is essential that they should not be excessively so, as dressings which blister not only do the horse a lot of harm, but they make it resentful to wearing harness for work. In the case of Sarcoptic Mange it is to some extent advisable that the dressings should be just sufficiently irritant to make the surface layers of the skin peel off, as this expels the females and larvæ from their dug-outs, and exposes them to the action of the dressings. *It is a waste of time to try to treat mange by merely dressing the visible patches*, because there are bound to be others which have not yet become apparent. To be successful, treatment on each occasion must be applied scrupulously to every part of the body and limbs, particular attention being paid to the nooks and corners, such as under the limbs, under the tail, the base of the ears, the mane, and other hairy parts, and it is advisable that these hairy parts should be kept clipped. *It is also a waste of time to apply dressings, and to leave too long intervals between the applications of dressings.* The first dressing if properly applied will kill the surface parasites, but it cannot be depended upon to destroy all those in burrows or all the eggs. A second dressing is applied to destroy the larvæ hatched after the first dressing, and those which have emerged from the burrows. If this second application is too long delayed the larvæ may have become adults, and laid a fresh crop of eggs. It is essential, then, that the interval between the dressings should not be more than, say, seven days. Theoretically, two such dressings at the proper interval should be sufficient to cure a case of Psoroptic Mange, but it is advisable to give at least three. For the cure of Sarcoptic Mange the interval between the dressings might be somewhat shorter, say four days, and the treatment should be continued until the case is pronounced cured by the veterinary surgeon in attendance. Sometimes an odd diseased patch may present special difficulties as regards curing. It would be well in such cases to obtain a special dressing for such patches with the advice of a veterinary surgeon, but, in addition, the whole body and the legs must be dressed with the ordinary spray dressings.

Half Measures Useless.—It is useless to treat the animals, and neglect the harness, stalls, flooring, rugs, brushes, rubbers, cart shafts, litter, etc. Some parasites may lurk on these articles and be the means of causing reinfection. These articles will disinfect themselves if kept from contact with

horses for about three weeks, for the parasites cannot live for long periods off their hosts which provide the nourishment for subsistence. It is better and more convenient, however, to disinfect these articles by spraying them with, or dipping them in, the tar oil and tar acid dressing. They may also be treated by exposing them for several hours to concentrated formaldehyde gas or sulphurous acid gas in a closed room or large box. Soiled litter should be well removed from contact with horses, and it will disinfect itself.

A Plea for the Blacksmith.—It has been suggested that something should be said about the blacksmith in relation to the spread of mange. Some blame the smith, but to be quite just, the smith has also cause for complaint. If owners did not send him affected horses to shoe, or if they sent him only horses which had been subjected to the curative and preventive treatment advised, less would be heard about mange contracted at the forge. Nevertheless, it seems reasonable to advise smiths to wear an overall when shoeing a suspected horse, and to disinfect his overall and apron afterwards as in the case of harness. He should also spray the smithy head-stalls and the flooring.

Suspect the Itchy Horse and Seek Advice.—Someone to my right suggested that a description of the symptoms of mange might be given. It is impossible in one lecture to cover every point of the subject, and I wish to get on with the principal part, viz., the demonstration. Further, to protect himself and obtain the full benefits from the amended Order, the owner should obtain veterinary advice regarding the form of mange which exists. A full description of the symptoms will be found in Leaflet No. 274, which can be had from the Publications Branch, Board of Agriculture, 3, St. James's Square, London, S.W. 1, or from Local Authorities for the asking.* My advice is, however, that you should regard every itchy horse as suspicious and have it treated, and at the same time treat the contacts as a precautionary measure. One of the objects of this meeting is to advise horse owners at the present time to treat their horses for the prevention and cure of external parasitism as farmers treat their sheep, and to do it of their own accord.

● *(This article is also issued as Leaflet No. 8B, of the Joint Committee of the Board of Agriculture and Fisheries and the Ministry of Food. Copies may be obtained, free of charge, on application to the Secretary, Joint Committee, 6A, Dean's Yard, Westminster, S.W. 1. Envelopes so addressed need not be stamped.)*

* A cinema film showing the method of applying the treatment has been prepared, and if applications are received from responsible bodies, arrangements will be considered for showing the film locally.

Ingredients.—Lime, powdered sulphur and water in the proportions indicated below. A convenient quantity for a

large establishment to make up at a time would be 9 lb. lime and 18 lb. sulphur.

**Dressing for
Mange in Horses,
Suggested by
the Veterinary
Department of the
Board of Agriculture
and Fisheries.**

Method of Preparation.—Slake the lime and make into a thick paste with the sulphur. Place the mixture in a strong cloth, tie the ends and suspend in a boiler containing 10 gal. of water so that the water completely covers the contents of the cloth. The cloth must not touch the sides or bottom of the boiler, as otherwise the cloth may be burnt and its contents escape. Boil for two hours, then remove the cloth, taking care that none of its contents escape into the water, and throw the solids away. Make up to 10 gal. again with additional water and put the liquid into a tight drum or barrel.

Application.—*For Preventive.*—*Application.*—Dilute the fluid with ten times the amount of water, i.e., 1½ pt. of the fluid to every 2 gal. of water, and apply with a spray to all parts of the horses' body.

For Affected Horses.—Dilute the fluid with eight times the amount of water, that is, 2 pt. of the fluid to every 2 gal. of water, and apply with a spray to all parts of the horse's body.

Quantity Used.—Two gal. of the diluted fluid is sufficient to treat one large horse.

Particulars as to other remedial dressings for Parasitic Mange may be had on application to the Local War Executive Committees, whom the Chief Veterinary Officer of the Board has undertaken to notify of preparations found especially useful.*

The best method is to give a first dressing with a tar oil and tar acid dip such as the above Committees recommend, and to continue with the lime and sulphur dressing.*

It is essential that every part of the body and legs be well drenched with the spray.

(This Note is also issued as Leaflet No. 8A of the Joint Committee of the Board of Agriculture and the Ministry of Food. Copies may be obtained free on application to the Secretary, Joint Committee, 6A, Dean's Yard, Westminster, S.W. 1. Envelopes so addressed need not be stamped.)

* Information as to suitable spraying pumps can be obtained from the same source.

With reference to the Note on "The 'Crop' of a Wood Pigeon," which was published in the issue of this *Journal* for August last (p. 584), the Board have received from Mr. S. P. Mercer of Armstrong College, Newcastle-on-Tyne, some interesting particulars of the contents of the crop of a wood pigeon shot in Cumberland in April, 1917. The crop contained about 8,000 seeds (weighing 14 grammes, after being washed and dried) of Spreading Orache (*Atriplex patula*), which were all ingested at one meal. It would seem, therefore, that the bird may sometimes be of some agricultural use. It may be stated that there were, in addition, about a dozen seeds of two species of vetch and a few very small scraps of clover leaf, but not enough of the latter to make one whole leaf.

The Importance of Dung Heaps and Composts.—The shortage of feeding stuffs is reacting on the manure heap, and the farmer's chief fertiliser will not be as rich as usual. This unfortunate state of affairs can be mitigated in two ways: (1) by taking the greatest possible care of farmyard manure, including liquid manure, and (2) by enriching the manure heap with any scraps and waste substances likely to be of sufficient manurial value. Farmers and others near large towns and villages who are able to obtain slaughterhouse residues, wastes from hide markets (such as salt, blood, and other fragments), sweepings of yards of salted hides of horses and cows, wastes from vegetable markets, or other similar materials, may make them into a compost, thereby increasing the bulk of manure available for application.

The need for improving the method of making and storing farmyard manure has been so often emphasised in these columns that it is unnecessary to do more than recapitulate the main items. First and foremost, the manure must not be exposed to the washing action of rain: the amount of damage suffered from this cause over the country is still very considerable. If the manure must be made in an open yard there should be an abundance of litter; broken and damaged straw, or straw released from potato clamps that have been opened, can be thrown in to prevent the manure from becoming too wet. When the manure is drawn out from the yard to be clamped, it should be put into as sheltered a position as possible, and, if at all feasible, covered with a layer of earth. Farmers

fortunate enough to possess liquid manure tanks should put these in order, and see that the drains are clear and unbroken. The liquid can be applied to grass land all through the winter and early spring : it makes an admirable dressing for temporary grass mixtures, and can be put on to stubbles intended to be followed by roots.

Compost Making.—In many parts of the country compost making is now a lost art, but at one time it flourished vigorously. Some of the farmers of 50 years ago were great adepts in the art. In certain districts composts are still made, and the practice might well become more general, especially in the case of small farms and market gardens. Perhaps the type of composts that has persisted longest is the old "lime compost," made by alternating layers of vegetable or animal refuse with lime. From the old directions given by one of the chief experts of his day, it appears that the best results were obtained when lime was composted with materials poor in nitrogen, such as hedge clippings, leaves, old banks of earth, scourings of ditches, road sweepings, weeds gathered from fallows or stubbles, peat, sawdust, roots of couch grass, etc. These were well mixed in the proportion of about one of lime to three of the other materials : the heap was left for a time, and then turned. The dressing was about 24 tons per acre, but sometimes more was used : modern conditions would demand less. Good results are said to have been obtained with cereals and on grass : indeed, many farmers still use some lime compost on their grass land.

Earth composts were preferred where the material contained more nitrogen than the above-mentioned substances, such, for example, as animal refuse, slaughterhouse waste, etc. The proportion of earth varied ; as much as 10 cartloads of earth to one of animal waste was sometimes used : in other cases only half this quantity of earth. It was, however, claimed that better results were obtained from the use of earth than from lime or farmyard manure : in these days of scarce labour, unfortunately, only horticulturists could make an earth compost, and usually it would be necessary to make a dung compost instead. In this case no earth is used, and the materials are simply thrown into the manure heap : obviously they should be richer in nitrogen than the ordinary vegetable refuse.

Bonfire Ashes as a Source of Potash.—The supplies of potash are still insufficient for all agricultural requirements, and whenever possible it is desirable to utilise ashes from bonfires. Docks, couch or twitch, hedge trimmings, fragments of straw, seeds, etc., from the threshing machine which cannot safely be thrown

into the yards or conveniently put on grass land, may be burnt, when they yield an ash nearly equal in value to kainit. To the allotment holder this source of potash is more valuable than to the farmer, because he usually has a larger amount of material to deal with in proportion to his smaller area of land: with care, he ought to have little difficulty in satisfying his potash requirements. Allotment holders' societies might well look into this matter and explore the possibilities in their own localities.

Improve Clover Leys if Possible.—Clover is playing an increasingly important part in the economy of the farm, both as a concentrated feeding stuff and as a fertiliser. Nothing should be left undone to secure a good crop. The two common causes of failure are wetness of the land and lack of lime. For wetness there is unfortunately only one remedy, viz., drainage, which, in present circumstances, is very difficult to apply. Lack of lime, however, is more easily put right, and no effort should be spared to do this. In some cases there is reason to believe that the nitrogenous manure applied to the corn crop in which clover was growing caused injury to the clover by stimulating the growth of the corn: this is unfortunate, but it cannot be helped. More commonly, especially in the Eastern Counties, the trouble has arisen because Red Clover is grown, and this variety, under conditions locally obtaining, is liable to clover sickness if sown too frequently on the same ground. Prevention here is better than cure: the trouble can be avoided by lengthening the time between successive crops, e.g., substituting Trefoil for the Red Clover, or a mixture of Alsike Clover and Trefoil. A certain amount of Red Clover can, if desired, be added to this mixture. Considerable attention to the clover leys will be needed both this year and next.

Nitrogenous Dressings for Winter-sown Corn.—The persistent rainfall of October has gone some way towards washing out nitrates from the soil, so that winter-sown corn will stand in need of help, and the need will become more prominent if the rain continues. A good dressing of household soot would be the best remedy, but, failing this, sulphate of ammonia is an effective substitute. In any case it is necessary to make provision early.

Army Stable Manure.—Farmers in Surrey, Sussex, and Hampshire who are near enough to Aldershot can obtain manure from the Eelmoor Dump at 5s. per ton. Analyses of Army stable manure show that it is very satisfactory in composition, and at this price must be considered good value for money.

Lime and Limestone.—Arrangements are now in working order for the distribution of lime in the South-Western Counties of England at a cost of 23s. per ton, which is cheap, considering the value of the return that may reasonably be expected on land deficient in lime. Particulars can be obtained from the Food Production Department of the Board.

THE following is a list of those varieties of fruit trees that have proved themselves generally to be the most serviceable for allotments and small gardens, the surplus from which finds ready sale if marketed. It should be understood that fruit-tree planting only pays on permanent allotments; war-time allotments are only supposed to carry seasonal crops.

It would be difficult, if not impossible, to name the "best variety" for every district, as the climatic conditions and soil vary so greatly in different places. The list here given, however, will be found to apply generally, and should form a useful guide. It is based on the idea that the surplus from any of the varieties noted would find a ready sale on the market if properly graded, and forthcoming in quantity, as well as supply the grower with desirable sorts for his domestic use.

APPLES.

Early Dessert Varieties: Fit to market when gathered.

<i>Name of Variety.</i>	<i>Season.</i>
Gladstone	July to August.
Beauty of Bath	" "
James Grieve	September to October
Worcester Pearmain	" "

Mid-season Dessert Varieties: Better kept for a time before marketing.

Allington Pippin	November to February.
King of the Pippins	October to January.
Charles Ross	November to December
Cox's Orange Pippin	December to February.
Blenheim Orange	" "
Ribston Pippin	December to March.
Rival	" "

Early Cooking Varieties: Gathered and sold at once.

Early Victoria	August to September.
Grenadier	September to October.
Stirling Castle	October to November.

Mid-season Cooking Varieties: Stored for a time.

Williams' Bon Chretien	September.
Conference	October.

Second Early Varieties : Will keep a few weeks after gathering.

Brown Beurre	November.
Brockworth Park	"
Pitmaston Duchess	"

Late Pears : Will keep some time after they are gathered.

Doyenne du Comice	November and December.
Glou Morceau	" "
Thompson	" "
Catillac	January to March (Stewing)

PLUMS.

It is assumed that these plums would be grown on standards in the open, as allotment holders very rarely have the facility of a wall.

The Czar	Early August.
Pershire	End August.
Victoria	September.
Pond's Seedling	Mid-September.
Monarch	End September.

DAMSONS.

For growing as standards :—

Farleigh Prolific Damson	September and October.
Merryweather Damson	" "
Shropshire Prune	September to November.
Langley Bullace	November.
Buckinghamshire Prune	"

The following are a similar list of the soft fruits :—

Raspberries : Superlative ; Norwich Wonder.

Black Currants : Boskoop Giant ; Lees Prolific ; Seabrook's Black.

Red Currants : Red Dutch.

Gooseberries : (Red Varieties) Lancashire Lad ; Winham's Industry ; Crown Bob ; Warrington ; Rifleman. (Green Variety) Keepsake. (White variety) White Lion. (Yellow variety) Leveller.

Strauberies : Givon's Late Prolific ; Laxton's Cropper ; Royal Sovereign.

Loganberry : This can be planted in any odd corner and proves very useful when trained over an unsightly fence, shed, or old building.

AN Agricultural Act providing for the national security and defence by stimulating agriculture and facilitating the distribution of agricultural products was approved by Congress on 10th August, 1917 (See this *Journal*, November, 1917, p. 880). By the Act certain sums of money were appropriated for agricultural purposes until June, 1918.

Agricultural Legislation in the United States.

A House Resolution, numbered H.R.11,954, was passed by the House of Representatives on 7th September, 1918, giving further support to this Act. It authorises further expenditure for certain agricultural purposes, and, *inter alia*, prohibits the manufacture from articles of food of spirits, wines, and other intoxicating drinks; prohibits the exportation and the transport among the several States, of certain specified feeding stuffs without a permit; and establishes a Rent Administration for the control of real estate in the District of Columbia.

The following are the principal grants appropriated for agricultural purposes by the House Resolution:—

For the prevention, control and eradication of the diseases and pests of live stock; the enlargement of live-stock production; and the conservation and utilisation of meat, poultry, dairy and other animal products, \$901,025 (£187,700).

For procuring, storing, and furnishing seed wheat and beans (this sum has already been authorised outside this Resolution) \$6,500,000 (£1,354,200).

For increasing food production, eliminating waste and promoting conservation of food, including edible nuts, by educational and demonstrational methods through country, district and urban agents and others, \$6,100,000 (£1,270,800.)

For gathering authoritative information in connection with the demand for, and the production, supply, distribution, and utilisation of food, and otherwise carrying out the purposes of Section 2 of the Act; extending and enlarging the market news service; and preventing waste of food in storage, in transit, or held for sale; advice concerning the market movement or distribution of perishable products; for enabling the Secretary of Agriculture to inspect and certify perishable agricultural products, \$1,280,155 (£266,700.)

For miscellaneous items, including the salaries of assistant secretaries appointed under the Act approved 10th August, 1917; special work in crop estimating; aiding agencies in the various States in supplying farm labour; enlarging the informational work of the Department of Agriculture; and

printing and distributing emergency leaflets, posters, and other publications requiring quick issue or large editions, \$1,105,980 (£230,400.)

THE following note is based on information supplied by farmers, agricultural organisers and officers of the Board in response to an inquiry addressed to them by the Food Production Department.

**Broadcast Wheat
Sowing.**

The modern and most approved method of sowing wheat, namely, by drilling, is not adapted for wet weather, consequently the efforts of farmers to get on with this work may be seriously hampered, as in the present season, by spells of rain. The effects of bad weather are felt most on the heavier classes of soil which, once thoroughly soaked in late autumn, are apt to remain wet and unworkable for many weeks.

In view of the national importance of getting in as much winter corn as possible farmers should, as an emergency measure, consider the question of sowing seed broadcast. About 1 bush. per acre more seed will be required than that normally allowed for drilling, but this should be counterbalanced by the advantage of earlier sowing, the saving of labour, and the larger area that can be tackled.

Broadcasting on the Furrow.—This is a general and successful practice on many of the heavier wheat lands. A well set-up furrow, properly harrowed after sowing, provides ample covering for the seed and, at the same time, enables water to get away more freely than the finer and deeper tilth usually prepared for drilling.

The practice is also adapted to old grass land where the turf would interfere with drilling. In this case it is advisable to "press" before sowing, so as to eliminate hollowness and secure a seed-bed of uniform depth and firmness.

Broadcasting and Ploughing In.—This practice is occasionally followed on free-working soils after potatoes, mangolds or turnips which have been cleared late in the season. In such cases the surface soil is already fairly friable and the usual preliminary ploughing and harrowing may thus be dispensed with. The seed is sown on the surface and immediately ploughed in to a depth of 2 to 3 in., and the land need not, as a rule, be harrowed afterwards. This method provides a seed-bed of the requisite firmness below, while at the same time it is left in a mellow, yet not too fine, condition above. The practice is not suited to heavy land as there is a danger of the plant not coming through.

If double-furrow ploughs are available the whole operation is quickly completed.

As a precaution against loss from bird attacks no more should be sown than can be covered in at one yoking; when once ploughed in, however, the seed is generally safer from birds than when drilled or harrowed in.

THE following particulars of work done during the past year at elementary schools in Hertfordshire in connection with food production speak highly of the efforts of the children in helping in the present national emergency:—

**Cultivation of
School Gardens in
Hertfordshire.**

One hundred and forty-one schools took part in the work, including 53 which have ordinary school gardens. The total area cultivated was 45 acres, of which 17 were in ordinary school gardens. The number of children engaged in the work was, approximately, 3,600 boys and 800 girls. The value of the produce distributed to the children in kind was £571, and of that which was sold, £355 14s., total £926 14s., but these figures do not include about 20 schools from whom the return as to produce has not been received. There are about 90 schools for older children which did not take part in the work, and most of these are proposing to do so during the present season.

THE new scheme of rationing for live stock comes into operation on 17th November, and particulars were given in our last issue* of the interim arrangements for distribution. It is with very great reluctance that the Food Controller has decided to institute a strict rationing of animals in so far as concentrated feeding stuffs are concerned.

The actual quantities permitted under the new scheme are as follows:—

Classes of Live Stock.	Per Day.		For Ten Weeks' Period.	
	Cake or Meal.	Offals or Grains.	Cake or Meal.	Offals or Grains.
Cows in milk, kept under rural conditions	lb. 2'4	lb. 2'4	cwt. 1½	cwt. 1½
Cows in milk, stall-fed under urban conditions	3'2	4'8	2	3
Calves under six months old ..	'4	'4	½	½
Bulls over six months old, kept for breeding	2'4	—	1½	—
Horses, agricultural	—	'4	—	½
Horses, not agricultural, entitled to rations under the Horses Rationing Order†	—	2'0	—	1½
Sows in farrow, and boars	—	3'2	—	2
Store Pigs	—	1'0	—	½

* See also this *Journal*, October, 1918, pp. 864, 888, 889, and 915, and later pages of the present issue giving subsequent information.

† Printed in this *Journal*, May, 1918, p. 231.

This means that for sheep and cattle other than dairy herds and breeding stock there are no supplies of imported food, and owners are compelled, therefore, to rely upon crops grown on the farm.

Rationing is not quite so serious as might appear at first sight, since oats, roots, beans, peas, hay, and straw are left free of the ration. A reduction, however, in the quantity of the feeding stuff to be supplied will be made by the Area Live Stock Commissioner on account of any quantities of damaged or tail corn for which the applicant has obtained a licence to feed to his stock.

The position which has led to the rationing of stock is due to the necessity of cutting down the British programme of total food requirements in view of the shortage of tonnage. In order to bring the maximum quantity of men and munitions to Europe it is necessary radically to limit the import of feeding stuffs and food. There are not enough ships for both. The demands of the American Army in Europe have very severely limited the space which could be devoted to ordinary cargoes.

When it came to making a choice between human and animal food, it was inevitable that the preference should be given to human food. Again, when a choice had to be made between the different classes of live stock, priority of supply was given to the dairy herds, because of the incontestable importance of maintaining the milk supply and breeding stock, so that the industry should not suffer permanent damage. Small supplies are available for pigs up to the end of the year, but after that point it is impossible to guarantee concentrated food, though there may be a limited quantity. This is not quite so serious at this period of the year as it would be at any other time, since a large proportion of the pig population is ordinarily slaughtered at Christmas. The warning now given will deter the purchase, especially by cottage owners, of stores for spring fattening.

Some farmers are much better supplied than others with home-grown foodstuffs—with oats, roots, beans, peas, etc.—and, if those who have sufficient stocks in hand are able to do without the concentrated foods, it may be possible to provide a small margin for other stock. Generally speaking, it is probable that the strain on shipping must continue for the present, and it is not likely that an increase in imported feeding stuffs will be possible; consequently, any gains must be made by economising in stocks.

The Ministry of Food recognise the difficulty under which farmers are placed, and the decision to institute a definite rationing of live stock on the basis just described was only reached after consultation with the agricultural authorities. A change is made in the system of distribution which places responsibility largely in the hands of the Area Live Stock Commissioners, who are in close and constant touch with the farmers' committees in their area; and the new arrangements will, it is hoped, provide a perfectly just basis for the distribution of such supplies of feeding-stuffs as it has been possible to import.

There are complaints with regard to the quality of some of the mixtures sold for the feeding of animals. It has been very difficult to control these on account of their very various compositions. Steps are now being taken by the Feeding Stuffs Section of the Ministry to standardise meals and to fix prices accordingly.

Feeding Stuffs Committee.—The constitution of the county committees has been considered by the Feeding Stuffs Board, and it has

been decided to make certain modifications. The committees will in future consist of—

- Four farmers, nominated by the War Agricultural Committee ;
- Three dealers, nominated as far as possible by local associations ;
- One representative of the co-operative societies, nominated by the Agricultural Organisation Society ;
- One miller, nominated by the local millers' association ; and
- One brewer.

The function of these committees will be to advise the Area Live Stock Commissioner on questions connected with licensing and registration, with control and sale, and in the distribution of feeding stuffs.

Area committees, mainly nominated by the county committees and similar in composition, are also being set up. The main duties of an area committee are to regulate the distribution of local produce, either by letting the producers act themselves as direct suppliers or by passing on to them buying permits for local supplies that have been given by the Area Live Stock Commissioner to local suppliers. Among other duties, this committee will have to advise on the withdrawal of dealers' licences.

It has been suggested that dealers and agents have in some cases given to farmers application forms with their own names filled in as suppliers, thereby suggesting that farmers are not at liberty to select any supplier they choose. Applicants may, if they desire strike out any names of suppliers inserted on application forms, and insert the names of other suppliers entitled to trade in their district. (*National Food Journal*, 23rd October, 1918.)

THE following questions were put, and the following answers given, in the House of Commons on 16th and 17th October :—

The Glut of Fat Cattle: Questions in Parliament. *Sir John Spear* : Is the Minister for Food aware that in Devon and Cornwall many thousands of fat cattle are ripe for slaughter, but cannot be disposed of by farmers because of the small demand now being made for such cattle for grading ? And is he aware that many of these beasts are declining in condition, and yet consuming food intended for the purpose of preparing lower-grade animals for slaughter in ensuing months ? In order to relieve the congestion, could he not arrange for the slaughter of a large number of these cattle and place the meat in cold storage for winter use, when meat will be very scarce ? And will he put in force a more expeditious method of liberating damaged corn in order to enable farmers to complete the fattening of more stock for winter killing ? (Wednesday, 16th October.)

Major Astor : I am aware that the supply of fat cattle is in excess of the requirements under the present scale of rationing, and that grass-fed cattle are bound to decline in condition unless arrangements can be made for yarding them. The Food Controller cannot increase the existing ration now without an equivalent reduction after Christmas, as there is no present proposal of any further imported supplies. It is, therefore, essential for our supply of meat early next year to encourage the farmer to keep his beasts until after Christmas ; but it is fully recognised that the actual and prospective dearth of feeding stuffs

makes his task difficult. The question has been discussed with the Central Agricultural Advisory Council, who have made suggestions to the Food Controller for the purpose of relieving the situation, and these are being sympathetically considered. Meantime, all possible means of utilising fresh meat are being adopted; arrangements have been made for supplying the Home Forces, both naval and military, as far as possible with home-killed meat, and an endeavour is being made to export some quantities to France. The frozen meat thus saved will be stored for subsequent use. There is no plant available for freezing any considerable quantity of fresh meat, but steps are being taken to provide cold storage which will enable such meat to be kept in a chilled condition for a certain time. In view of the fact that it is impossible to import sufficient frozen meat to provide the necessary meat ration for the first four months of the year out of frozen meat only, the Food Controller hopes that farmers will do their utmost to hold over their cattle as long as possible. The arrangements made for administering the Cereals (Restriction) Order* are working satisfactorily. From 1st September to 9th October, 23,423 qr. of damaged grain were released for feeding purposes. Nearly 5,000 applications have been dealt with, and approximately nine-tenths of these were successful. An Order is being drafted to register grist millers to fix a maximum charge for the mechanical treatment of cereals and pulse and to fix maximum prices at the cost of ingredient plus the permitted charge for such treatment. The Order will prohibit the addition of husk and worthless material and the gristing of composite meals consisting of cereals and pulse, and will provide for weekly or fortnightly reports from all grist millers of the composition of the meals and the cost of the ingredients into the mill, and of the price charged *ex mill*.

Captain Sir B. Stanier : May I ask if the hon. and gallant gentleman is aware that not only in Devonshire and Cornwall, but in practically every county in England, this same sending back of the animals for market is going on, and cannot he go further and deeper into the question of chilling?

Sir J. Spear : May I ask if he realises that the holding back of this cattle at present will reduce the supply for winter use?

Major Astor : The Food Controller is quite aware of the difficulties which farmers are experiencing. The matter has had the attention of the Department for some time, and he hopes to make an announcement shortly. At the moment, generally speaking, only first-grade animals are being slaughtered.

Colonel Weigall : Are we to understand that the whole question of the feeding stuffs and home-produced cereal feeding stuffs is to be reconsidered; and, if so, will the advice of the Central Advisory Council be taken, in view of the fact that the present programme was agreed on without consulting the Advisory Council?

Major Astor : As I said just now, the suggestions of the Central Advisory Councils are being sympathetically considered by the Food Controller. I am afraid there is no prospect of revising their whole feeding-stuffs programme, because that depends on the military programme.

Colonel Weigall : Then how is their advice being considered?

Major Astor : They have made various suggestions for dealing with the present excessive number of cattle coming on to the market, and those suggestions are being considered.

Sir F. Flannery : Will the hon. and gallant gentleman say whether his Department is aware that in every market throughout East Anglia there is this going back of beasts for which there is no sale, and will he also say whether his Department and the Board of Agriculture are exactly in unison and acting together in this matter ?

Major Astor : The Food Controller has been in constant touch with the three Boards of Agriculture, as well as the Central Advisory Council.

Colonel Yates : Will the hon. and gallant member say who is responsible for the Orders that resulted in this glut of beasts ?

Major Astor : The glut is not due to any Order. It is due to the military programme, and the need for bringing over an increased number of American troops. That has meant a cutting down in the quantity of imported feeding stuffs, and the Food Controller is confident that as soon as this is appreciated by farmers they will do all in their power to assist.

Mr. Denman : Will farmers be allowed to use their own damaged corn ?

Major Astor : There is no restriction except as regards price upon the sale of damaged grain, except when sold by retail—that is to say, quantities of 10 cwt. or less.

[NOTE.—It is clear from the terms of the Cereals (Restriction) Order,* which was quoted in the main reply, that "damaged grain" here refers to such tailings of corn and damaged wheat, rye, barley or dredge corn as have been certified by the local Grain Officer to be unfit for the manufacture of human food, and for which the farmer has been granted a licence entitling him to feed them to livestock.]†

On the Motion for Adjournment, Sir John Spear said : The question of the slaughter of fat cattle is so important that it was not possible to deal with it by question and answer across the floor of the House. I cannot produce exact figures as to the extent of the difficulties that have arisen, but I think I am within the mark when I say that for every fat beast accepted by the butchers, two, if not three, are rejected through lack of opportunity to dispose of them. The farmer has been urged by the Prime Minister and others to do everything possible to produce meat, and we have been asked more than once this year to keep back the beasts and make them heavier in order to increase the food supply, and now there is not by any means sufficient outlet for these cattle. In addition to these difficulties, the Government is commandeering a great part of the hay. My hon. and gallant friend spoke of the lack of provision for cold storage. I think the Government is very seriously to blame for the neglect to make provision of this character. While we realise the difficulty, which is approaching disaster to the farmer, after all it is a matter for congratulation that after four years and more of war we are dealing with the difficulty of home supply instead of lack of food for the people. It cannot go beyond a month, or at the most six weeks, because there are certain farmers the character of whose land would not enable them to produce more than second-grade cattle. I

* Printed in this *Journal*, September, 1918, p. 745.

† See p. 1014.

would urge again on my hon. friend (Major Astor), who has shown appreciation of the case, the necessity of the immediate liberation of damaged grain, and of allowing farmers to use for their cattle all the dredge corn which they have grown. I think it is absolutely necessary for milk production that all the cake should be freed for use. I would also suggest that there should be an increased price for meat during the winter of at least 5s. per live cwt., to encourage farmers to keep on their cattle and to remunerate them for the extra outlay. I claim that the great influx of cattle from Ireland should be checked.

The debate was continued by Sir Croydon Marks and Major Lane-Fox.

Major Astor : In the very few moments that are available, I wish to put as many facts as I can before hon. Members, and I welcome this opportunity of doing so, even in a restricted manner. First of all, I quite realise—and we all realise—the extraordinary difficulty farmers are placed in at the present time. We fully appreciate that. But we are quite confident when they realise the facts and difficulties that we shall be able to count upon their co-operations.

Sir F. Flannery : More sacrifices !

An Hon. Member : Why do not you buy refrigerating plants ?

Major Astor : First of all, the situation which has arisen is entirely owing to the military programme decided upon by the Allied Governments ; and, secondly, my right hon. friend has acted in consultation with the President of the Board of Agriculture and the Agricultural Department. They have agreed, and we have all agreed, as to the programme. The Food Controller, no more than the President of the Board of Agriculture, wants to cut down feeding stuffs—it is obviously not to our interest to do so : we are interested in the maintenance of the production of food—but the figures which have been agreed to have been approved of and settled by the Cabinet with due regard to the military programme.

Mr. Leif Jones : May we know what tonnage they have allowed ?

Major Astor : I cannot give the figures. As regards the present situation, it is due to a certain extent to the fact that in last August and September we had considerable difficulty in providing meat, as growing cattle were not coming forward as well as we expected. They were kept longer on the farms owing to there being a great deal of grass during those months. I can assure hon. Members that the various proposals which have been put forward will receive sympathetic consideration. Some of them are always being considered, and others will be carefully attended to by my right hon. friend. May I mention some of the steps which are being taken to relieve the situation ? First of all, we are trying to get as much fresh meat consumed as possible, while at the same time reducing the amount of frozen meat which is being consumed. The Army has been taking fresh meat four days a week. Arrangements have now been completed with the War Office whereby the military forces in England will take fresh home-killed meat for six days per week. The Navy are taking as much fresh meat as they can, but it is quite obvious that they have to depend to a great extent on frozen meat, since they have to go to sea. As regards storage accommodation and refrigerating accommodation, hon. Members are quite wrong in saying we have not got enough storage accommodation. (Hon. Members :

"Refrigerating!" We have got ample refrigerating accommodation for storage purposes, but the difficulty is that the plant is not available for freezing. It is practically impossible to use the present plant for freezing. We provided the necessary storage accommodation to meet the situation required by the military programme. There is a shortage of freezing plant in the United States at this moment, and, in addition to that, although we are freezing a certain amount, we find a considerable lack of skilled men. We hope to deal with 2,000 tons by chilling them, and as far as freezing goes, at present, I think we are freezing 4,000 to 5,000 beasts per week, and we hope to work up to a maximum of 8,000. That is all we can hope to do, but it will be of considerable assistance. I only wish we could do more. It has been suggested that we ought to increase the meat ration now, and thus relieve the situation. I am sure the House will agree with me that it is essential to be able to guarantee a fair meat ration from January to April. Whatever we do, there is a strong possibility that the meat ration may be reduced, that it may come down. We cannot look to any increase of frozen meat from the U.S.A. We cannot allow for any increase of importation on our present expectations. As regards damaged grain, as I told my hon. friend at question time, nine-tenths of the applications for licences have been granted already, and our reports are that the machinery is working well. We are going to have an Order shortly dealing with composite meals, which, I believe, will be of considerable assistance to the farmer and do away with some of the genuine grievances which have existed in the past. I am sure there is no farmer who is not willing to submit to any inconveniences and difficulties—and he will have to face inconveniences and difficulties during the winter—if by doing so he can do anything to shorten the War even by a few weeks. What is happening in France shows, I think, the Government are justified in concentrating their efforts on bringing the War to an early termination, and I am perfectly certain that when the facts are known—and I have tried to put them briefly before the House—we shall be able to count on the ready co-operation of the farmers, whose difficulties we fully appreciate. (*National Food Journal*, 23rd October, 1918.)

Colonel Wheeler asked the Parliamentary Secretary to the Ministry of Food, on 29th October, if he had received a resolution from the Central Associated Chambers of Agriculture protesting against the breach of faith with farmers by the recent action of the Ministry of Food in sending back from the markets fat cattle and sheep and refusing to allow them to be sold although ripe for the butcher, and asked what action he proposed to take in the matter.

Mr. Clynes : The answer to the first part of the question is in the affirmative. As was stated yesterday, the holding back of cattle at the present time is the only policy which will secure the necessary meat ration for the first five months of next year. No undertaking was ever given to accept all stock which farmers might desire to sell regardless of national requirements, and there is, therefore, no breach of faith involved. Any additional expenditure will be met by the increased maximum prices which have now been sanctioned. I am confident that farmers will meet this difficult situation with the resource and energy which they have already displayed.

BULLETIN No. 274 of the College of Agriculture, Agricultural Experiment Station, University of California, contains an account of an

**The Common Honey
Bee as an Agent
in Plum Pollination.**

Valley, and which forms part of a series undertaken to determine why, under certain conditions, some plums bear abundant crops and under other conditions bear light crops or none at all.

In a large orchard two pairs of adjacent French and Imperial plum trees, as nearly as possible of the same age and size, were enclosed in a tent of white mosquito net, so as to exclude all insects. In every other way the trees were under the same conditions as the other trees in the orchard. The tents were put up before any of the blossoms opened, and taken down when there was no longer any danger of outside pollination. As soon as 25 per cent. of the blossoms had opened a hive of bees was placed under one tent, and kept there throughout the blossoming period (about five days). The bees seemed to prefer the flowers of the French plum to those of the Imperial plum. The results are given in the following table :—

Trees.	No. of Blossoms Counted. 11th April, 1916.	No. of Fruits Matured. 1st August, 1916.	Per- centage.
French plum under tent with bees..	1069	193	18.05
„ under tent from which bees were excluded	1058	11	1.94
French plums, average orchard set..	9991	359	3.59
Imperial plum under tent with bees..	1060	18	1.89
„ under tent from which bees were excluded	1050	0	0
„ average orchard set	2180	157	7.20

It is seen that the French plum under the tent with the bees set a much higher percentage of fruit than the other trees. The light crop obtained from the Imperial plum under the tent with the bees is unaccounted for, and it is intended to carry out further experiments to determine the cause.

The results show the honey bee to be one of the most important factors in carrying pollen from one tree to another. The most satisfactory method of introducing bees into orchards has not yet been decided, but it seems that the best results are to be obtained by placing about one hive to the acre during the blossoming period, after which the hives could be removed.

THE young shoots of nettles have long been used as a vegetable cooked like spinach or as a constituent of soup, though in recent times this practice seems to have become almost extinct. Nettles have also been used, chiefly in the cooked state, as pig's food : formerly, it was a common practice to cut nettles and cook them for pig's food, and in some cases they formed quite a large part of the food of the cottager's pig.

In view of these facts, and of the desirability of making use of all suitable foods during the present difficult times, a series of analyses was made by Professor Hendrick of nettles gathered at different stages of growth. The analyses show that young nettles up to the end of May, when they are 12 to 18 in. high, form a rich and valuable feeding-stuff. In the dry state they contain as much albuminoid material as linseed cake, and they also contain a fair proportion of substances extracted by ether which largely consists of fats. The ash is also high, but its composition has not yet been examined in detail. After May the nettles grew very rapidly, and when sampled early in July they were almost 5 ft. high, and were in flower. At this stage it was found, as was expected, that the fibre and soluble carbohydrates had increased. The material was still highly nitrogenous for a vegetable product, and contained a much higher percentage of nitrogen than, for instance, grasses. Dried nettles, therefore, at flowering stage contain considerably more albuminoid than ordinary hay, and are quite as rich as hay obtained from leguminous crops.—(*National Food Journal*, 11th September, 1918.)

Allotments and the Cultivation of Lands Orders.—The Food Production Department directs the attention of allotment holders and local authorities to the fact that the

Notes on Allotments. Board of Agriculture have lately issued the Cultivation of Lands (Allotments) Order, 1918,* to supersede the Cultivation of Lands Order, 1917. Among the provisions of the Order is one which enables a Borough or Urban District Council, or the London County Council, to enter on land, including the buildings thereon, for the purpose of using it for the keeping or breeding of poultry or bees, or arranging for its use for this purpose. A Council may so enter on land without any further sanction of the Board of Agriculture. If a Council desires, however, to enter on land for the purpose of using it for the keeping or breeding of "live-stock," such as pigs, the express sanction of the Board must be obtained and such sanction must also be obtained if it is desired to use land already entered upon for keeping livestock. Given this sanction a Council may arrange for the use of land for any of the purposes named by any person, either under a contract of tenancy or otherwise. Security of tenure is provided until the expiration of two years from the end of the War,† except in those cases where it is shown to the satisfaction of the Board that the land is required before that date for building or other special purposes, or where the compensation payable if the land is retained would be greatly in excess of the value to the nation of the food produced."

It has been brought to the notice of the Food Production Department that a strong desire exists on the part of many ploholders that wherever possible land for allotments should be secured on lease for a term of years, so that the ploholders may have greater security of tenure than is provided for under the Corn Production (Amendment) Act and the Defence of the Realm (Acquisition of Land) Act, 1916.† "The large extension of the allotment movement during the War, particularly in the urban areas, has been a development of the utmost

* Printed in this *Journal*, September, 1918, p. 718.

† See also Note in this *Journal*, September, 1918, p. 725.

value both to the nation and to the plotters themselves," says an official circular to the local authorities, "and the Board of Agriculture are anxious that the movement should be established on a permanent basis." It is suggested, therefore, that the local authorities wherever desirable and possible should negotiate with the owners of land taken for allotments under the Cultivation of Lands Order with a view to acquiring it on lease under the provisions of the Small Holdings and Allotments Act, 1908.

It may not be possible in all cases to secure a tenure for a definite number of years; but the President of the Board (Mr. Prothero) feels sure that many landowners will be willing to consider favourably applications for a lease. He advises that local authorities should proceed on these lines alike as regards land already in their possession under the Order and any additional land that may be required. He hopes and believes that there will be a considerable further extension of the allotment movement, with which he and his Board are in the most cordial sympathy. "It has been of great benefit to the nation at a time of serious crisis," testifies the Food Production Department, "and has assisted materially in relieving the anxieties of the Government in the realms of shipping and finance by making use of part-time labour in the work of increasing production of food at home."

The financial side of the allotment movement has been rather anomalous in many districts, and in the official view the time has now arrived when this matter should receive attention. At the time the earliest of the Cultivation of Lands Orders was made it was anticipated that the plots might have to be given up within a year or so. As an adequate return for the labour and expenses necessary to cultivation could not in all cases be expected within that period, the Board of Agriculture undertook to pay any deficit on the allotments up to a maximum of £2 per acre—under certain conditions up to £3 per acre incurred by a Council in providing or adapting land for cultivation. Some local authorities have assumed that £2 per acre would be granted in all cases and have made no effort to put the allotments on a paying basis. Mr. Prothero considers it reasonable that economic rents should be paid in future and asks local authorities to give this matter their careful and early consideration.

Allotment Progress.—During the week ended 18th October, local authorities agreed to lay out more new allotments than for many weeks past. The area concerned was 316 acres and the number of plots upwards of 4,300. Manchester and Barnsley head the list with 46 and 41 acres respectively; Bedford is next with 33½ acres; Ashington fourth with 32 acres; Hove fifth with 24½ acres, and Wigan and Tamworth equal sixth with 20 acres each. Other places in the list are Tredegar, 14 acres; Newton-in-the-Isle, 13 acres; Reading and Broughton (Lincs), 10 acres each; Birmingham, 2½ acres; Wimbledon, 8½ acres; Ipswich, Richmond (Yorks), and Ripon, 5 acres each; Plymouth, Norton, and Whickham, 4 acres each; Smallthorne and Welshpool, 2 acres each; Windsor, 1½ acres; Bungay and East Dereham 1 acre each.

Fertilisers for Allotments.—Allotment holders who are anxious about their fertiliser supplies should communicate at once with the secretary of their association, if they are members of an association; if not, they should apply to the Horticultural Sub-Committee of the County Executive Committee in which they reside. The Horticultural

Sub-Committee will then put them in touch with one of the fertiliser agents approved by the Food Production Department. These agents are stocking certain quantities of superphosphate, basic slag, and sulphate of ammonia, specially to meet the requirements of allotment men and other small growers. Some of the agents are also storing a certain amount of blast furnace flue-dust, which is a potassic fertiliser and can be used for the purposes for which kainit was formerly used. Small growers should not wait until the spring before ordering their superphosphate; they should do this at once. If orders are deferred difficulty may be experienced in obtaining supplies. Moreover, prices are officially fixed on a sliding scale so that the sooner supplies are bought the cheaper they are. The Food Production Department is in communication with the Horticultural Sub-Committees with a view to the prompt delivery of fertilisers, economy in the use of bags, etc., and allotment men can greatly facilitate the work of the Department by following its advice to order immediately.

Question in Parliament.—In replying to a question in Parliament on 17th October, as to the advisability of forming a Committee to provide sufficient land in the form of allotments to produce food for each household, Mr. Prothero stated that the Board of Agriculture possess the necessary powers for the provision of land for allotments, and have delegated them to the Agricultural Executive Committees and to the Urban Local Authorities. These powers are being exercised freely wherever there is a demand for more land for allotments.

In regard to whether local councils can be given power in future to borrow money for the specific purpose of the freehold purchase of land in order to lease it for food production, Mr. Prothero said that power to purchase freehold land for small holdings and allotments is already provided by the Small Holdings and Allotments Act of 1908. It was there in abeyance owing to the fact that the Government have discontinued making advances out of the Local Loans Fund for such purposes during the War.

He further stated that a special branch of the Food Production Department of the Board is already charged with the duty of promoting the allotment movement. Every information as to allotments will be supplied on application to the Director-General of Food Production at 74, Victoria Street, London, S.W. 1.

In replying to a question in Parliament on 21st October, respecting the relationship of the Agricultural Organisation Society to the Board

**The Agricultural
Organisation
Society: Question
in Parliament.**

of Agriculture, and the grants made to the Society in aid of allotments, the President of the Board stated that the Society holds no official position under the Board of Agriculture or the Food Production Department, but that it receives grants in aid of its work through the Board. In regard to grants made to the Society during the War for the purpose of promoting allotments, the amount of grant made this year is £10,000. This grant is administered through the Food Production Department, and the whole of it may be said to be available by the Society for stimulating co-operative trading, so far as that can be done by (1) supplying organisers to address meetings of allotment-holders on the advantage to themselves and to the State derived from organisation on co-operative

lines; (2) assisting in the formation of societies among allotment-holders; (3) advising societies in their trading and other operations. The grants to the Society in the earlier years of the War were applicable both to the promotion of agricultural co-operation generally and to co-operation among allotment-holders. These grants were as follows:—

	1915-16.	1916-17.	1917-18.	Totals.
Payments by Treasury from Development Fund	£ 9,290	£ 6,925	£ 13,240	£ 29,455
Payments by Board from Small Holdings Account	2,000	1,988	2,000	5,988
Totals	11,290	8,913	15,240	35,443

It should be mentioned also that the grant to the Society from the Small Holdings Account for the current year is £4,000, of which £1,000 is applicable to the Society's allotment work.

As regards the control exercised by the Board over the operations of the Agricultural Organisation Society, the control is exercised partly by means of definite conditions attached to the grants of Government money, and partly through the constant touch which is maintained between the Department and the officers of the Society, and through the work of the two nominees of the Board who sit on the Executive Committee of the Society. The grants to the Society are, moreover, annual, and the work of the Society comes up automatically for review every year.

Popular Land Women.—The demand for woman labour still exceeds the supply. There is at the moment an increased demand also for women milkers. A number of women trained in this work have for some weeks been drafted to other employment as there were no vacancies for them as milkers. They will, however, be withdrawn from any other work on which they are at present employed so soon as sufficient women are set free from potato gangs to replace them.

Women's Work on the Land.

Successful Woman Thatcher.—A woman thatcher, trained in Essex, has been employed with much success, and is already booked in advance by two more farmers so soon as her present job is finished. Many women are doing good work as thatchers: and further facilities are to be afforded for the training of women in thatching.

Land Women's Efficiency Test.—An interesting efficiency test was held in West Suffolk during the week ended 18th October, the first such test held in the county. It was conducted on the farm of the Chairman of the War Agricultural Committee, and three other farmers assisted in judging. The girls were examined in milking, ploughing, root pulling, manure loading, spraying and thatching. Fifteen recruits were tested and only one failure in one subject is reported.

Women's Training Farm.—A farm has recently been started in Essex by Miss Bowen Colthurst, formerly Principal at Holmes Chapel College. This farm is to be run for the training of women in agriculture, and 160 acres will be ploughed immediately.

At a meeting of the Society for the Promotion of the Cultivation of Moors, held at Berlin, an interesting report was read of the progress made in cultivation in the different districts. The *Weser-Zeitung* (28th February) calls attention to it. The original difficulties as to the cultivation of waste lands have been met. Some 417 associations have been formed, covering a tract of .hct.156,173, and 4,335 private individuals have taken over hct.15,740 on Government terms. The cost of reclaiming these hct.172,000 is estimated at Mk.66 mill.* It has been impossible to keep up the splendid start made in this work, but interest has been aroused and, when peace comes, fresh progress will be assured. The economic measures necessary during and after the War for cultivation of waste lands were pointed out at the meeting. The shortage of labour would prevent more intensive culture. It was imperative that every farm should plant the crops and feed the stock for which it was best adapted. Meadows and pasture land must be extended and root crops developed as far as possible. It is important in order to save labour that roots be grown near the farm buildings and that crops of various kinds be planted which do not all ripen at the same time. It was also shown that two possible methods of developing the cultivation of moors existed: taking into cultivation suitable waste lands, and increasing the productivity of moors already reclaimed. The national and political importance of this form of cultivation is great, since it creates industries for the lower- and middle-class peasant and adds to the numbers and strength of the nation. The economic value of the movement is obvious, and it was urged that the State should help it in every way by appropriate legislation and organisation. (*Reconstruction Supplement to the Daily Review of the Foreign Press*, 9th April, 1918.)

OFFICIAL NOTICES AND CIRCULARS.

N.B.—The Orders which may be mentioned in this section of the JOURNAL may usually be obtained at the price of 1d. each from H.M. Stationery Office, Imperial House, Kingsway, London, W.C. 2, and 28, Abingdon Street, London, S.W. 1; 37, Peter Street, Manchester; and 1, St. Andrew's Crescent, Cardiff.

THE following Circular Letter (No. C.L. 282/M. 6) was addressed to Agricultural Executive Committees by the Food Production Department of the Board on 7th October:—

Use of Tractors. SIR,—It has been brought to the notice of the Department that in certain districts extensive contracts for tractor ploughing have been made by Committees with the larger farmers, with the result that the smaller men are unable to obtain the use of Government tractors to the extent they

* 156,173 hct. = 386.00 acres; 15,740 hct. = 39,000 acres; 172,000 hct. = 425,000 acres. 66 million marks = £3,300,000, at 1 mark = 1s. The cost of reclaiming, therefore, works out at £7 13s. an acre.

desire. The Department realise that in planning the work for the present season it has been necessary in some instances to accept requests which have been made in good time by larger farmers, and to arrange for their work to be done at an early date in order to guard against the possibility of tractors standing idle, but in accepting future contracts Committees will doubtless bear in mind not only the importance of assisting the smaller farmers but the desirability of avoiding any appearance of preferential treatment of the larger farmers. The larger farmers are for the most part better able to help themselves, and should be encouraged to buy their own tractors rather than use Government-owned machines.

Cases have come to the notice of the Department in which farmers are selling their horses and relying upon Government tractors to do their work. Such action does not help food production, and the assistance of Government tractors should not be given in those cases.

I am, etc.,
(Signed) R. SOTHERN HOLLAND,
Controller, Cultivation Division.

THE following information (Ref. No. C. L. 142/L. 2) was circulated to Agricultural Executive Committees by the Food Production Department of the Board on 25th October :—

**War Agricultural
Volunteers.**

1. *Applications of Men to be Enrolled as War Agricultural Volunteers for Assignment to their Existing Employment or Existing Employer* :—(a) Application should be refused from men who were principally and usually engaged in agriculture on 28th May, 1918. Such men will continue to be dealt with under the arrangements regarding the issue of agricultural vouchers.

(b) Applications may be accepted from men who entered agriculture after the 28th May, 1918, subject to the applicant being otherwise eligible for enrolment and protection as a War Agricultural Volunteer and to the vacancy being approved by the Agricultural Executive Committee as one for which a War Agricultural Volunteer would be required. In this instance applicants may claim subsistence allowance only and *not* daily travelling allowance. The Enrolment Form should be amended accordingly before being signed by the man.

(c) Applications may be accepted from men who are employed on *non-agricultural work*, to be enrolled and assigned to the same employer for employment on *agricultural work*, subject to the conditions laid down in (b) above. In these cases particular care should be taken by the Agricultural Executive Committee or Exchange to whom the man applies for enrolment, that the employer signs the usual undertaking (Form W. A. V. 19) that the man will be employed "solely on agricultural work."

2. *Procedure for Dealing with National Service Volunteers Placed in Agriculture who Leave their Agricultural Jobs*—Any man who was placed as a National Service Volunteer in agriculture can, on leaving his National Service Volunteer job, be enrolled as a War Agricultural Volunteer, notwithstanding his having been engaged in agriculture on

the 28th May, 1918. Such men, if of military age, will ordinarily be in possession of some form of exemption or protection from military service. They may accordingly be enrolled irrespective of age and medical grade, but they will not be entitled to protection from military service solely as War Agricultural Volunteers unless they satisfy the conditions under which War Agricultural Volunteer Protection Certificates are issued.

3. *Occupations in which Men may be Placed as War Agricultural Volunteers.*—Agricultural Executive Committees should note that men may only be placed as War Agricultural Volunteers in any of the occupations in respect of which agricultural vouchers can be issued.

4. Particular attention is called to paragraph 12 of F. P. 278/L. 2* requiring that the original Forms W.A.V. 1 and W.A.V. 17A should be forwarded to the Ministry of National Service. Delay in forwarding these Forms may entail delay in the refund of any allowances paid by Agricultural Executive Committees on behalf of the Ministry of National Service.

THE following Notice (No. C. L. 286 (a) /M. 12) was addressed by the Food Production Department of the Board on 14th October :—

It is most desirable in the national interest that the services of prisoners of war should be used to the greatest possible extent for threshing. These men can be obtained in the following ways :—

Employment of Prisoners of War on Threshing Work.

1. **From Central Agricultural Depots.**—There are at the present time 330 depots in various parts of the country from which prisoners of war are sent out daily under the direction of the County Agricultural Executive Committee for agricultural work. Each of these depots contains 30 or more prisoners of war. By arrangement with the Agricultural Executive Committee gangs of men can be supplied for work within easy distance of the depot, the prisoners returning to the depot each night. The prisoners are required to walk a distance of 3 miles each way if necessary ; over this distance a conveyance must be provided by the employer unless conveyances are already attached to the depot.

Many prisoners at these depots claim to be skilled threshing engine drivers and feeders, and sets could, therefore, be worked wholly by prisoner labour within a 3- to 5-mile radius of the depots. If in the case of any particular depot the skilled men required are not available, men of the required type can be transferred from another depot where there is a surplus. In the event of owners of idle machines being unwilling to employ prisoners as drivers, etc., the County Agricultural Executive Committee will consider whether the machines should be taken over and worked by prisoner labour under their control.

The services of prisoners working under the above scheme are paid for at local rates by employers direct to the Commandant, the hours actually worked being charged for. The prisoners will be rationed by the military authorities.

2. Prisoners Boarded and Lodged on Employers' Premises.—Not more than three German prisoners can be sent out without guard to be boarded and lodged on the employer's premises on application to the County Agricultural Executive Committee. Employers must be responsible for the men and conform to certain rules laid down by the military authorities. They must never be lodged away from the employer's premises, and outside working hours must not be allowed more than half-a-mile away from their lodging. This scheme enables a machine to be worked by a prisoner driver and feeder within daily travelling distance of the threshing machine owner's own premises where he has accommodation for the men. Payment must be made at current weekly rates to the Commandant, less a deduction (at present 15s. a week) for cost of board and lodging.

Prisoners cannot be sent out under this scheme to premises situated in prohibited areas, *i.e.*, places near the coast, munition areas, etc. Employers in doubt as to whether they are in a prohibited area or not should communicate with the County Agricultural Executive Committee.

3. Proposed Scheme for Provision of Migratory Gangs.—A scheme has been submitted to the War Office for the provision of gangs of 10 prisoners and two guards, to be accommodated in lock-up buildings selected by the County Agricultural Executive Committee, each gang to be attached to one or more threshing machines and to be moved from farm to farm with the machines. In the event of the War Office being able to sanction the scheme, a further Memorandum will be issued.

It is particularly to be noted in connection with the use of prisoner labour for threshing that in no circumstances are Women of the Land Army and prisoners to be employed on the same threshing set.

THE following Memorandum (No. C. L. 143/L. 1) was addressed to Agricultural Executive Committees by the Food Production Department of the Board on 25th October:—

Prisoners of War: With reference to the Memorandum
Migratory Gangs. C. L. 139/L. 2,* as to the retention or substitution of migratory gangs of prisoners of

war for the potato harvest, the War Office have now notified all Commands (Ref. No. 2,337 P. W. 3) that migratory gangs already out or replaced by prisoners of war from parent camps, may remain out until further notice for any urgent agricultural work such as threshing. Commands have, however, been informed that for the present it is to be understood that the total number of prisoners of war detailed for such migratory gangs from parent camps is not to exceed the number of prisoners from non-agricultural camps recently withdrawn at the conclusion of corn harvest work.

Committees may, therefore, apply to the Command concerned, through the Area Commandant, for the formation of migratory gangs of prisoners required for threshing work, but the Command will not be able to supply a total number of prisoners in excess of the number who were engaged on harvest work under the migratory gangs system.

* Not printed in this *Journal*.

THE following Notice was issued by the Food Production Department of the Board on 16th October :—

Ploughmen for Food Production Department has been able to arrange with the Military Authorities that soldier ploughmen belonging to Agricultural Companies who have been recently graded "A" are not to be withdrawn from the farms for the present, even though substitutes have already been provided by the Military Authorities. The War Office has also informed the Department that every effort will be made to find an additional number of skilled ploughmen to assist in the autumn work. To this end inquiries are being made into the number of ploughmen serving in the Army at home who can be made available for sending out on two months' agricultural furlough.

IN reply to a question in Parliament on the 22nd October, Mr. Prothero stated that the area of arable land this year in England is 11,463,679 acres, in Wales, 934,961 acres, and in Scotland, 3,452,156 acres. He understood that the area of ploughed land in Ireland this year was 3,240,710 acres.

Tillage and Arable Land: Question in Parliament. He further stated that the Board desire that, as far as labour is available, the acreage of tillage should be increased, in order to obtain an additional output of corn, including beans and peas, at the harvest of 1919. The Board look for every effort on the part of the farmers with this essential object in view.

THE Food Production Department recently issued a warning to farmers of the danger of sowing wheat infested with ear cockles, since a comparatively slight infestation may seriously reduce the yield of the crop. From samples received at the Seed Testing Station, however, it is evident that cockle-infested grain is fairly prevalent in certain districts such as the south-western counties and parts of Wales; and where there are strong reasons for using such wheat for sowing, farmers should primarily remove as many of the "cockles" as possible. This may be done by floating them out. The operation needs care. When the wheat is first placed in water, only a certain proportion of the cockles float. The remainder sink; but later, after soaking for about three-quarters of an hour or less, they also float. The treatment recommended, therefore, is to stir the wheat thoroughly in water for five minutes. All cockles rising should then be skimmed off. The wheat should be allowed to remain in the water for three-quarters of an hour, stirring thoroughly at intervals of five minutes. At the end of three-quarters of an hour, any further cockles which have risen should be skimmed off. The wheat may then be dried ready for sowing. While the wheat is being treated, thorough stirring is important. The depth of wheat in the vessel should not be greater than necessary, as it is

* An article on Ear Cockles in Wheat was published in this *Journal*, October, 1918, p. 850.

naturally more difficult for cockles to rise through a great depth of wheat. If desired, wheat may be dressed against bunt at the same time by steeping it in a 1 per cent. copper sulphate solution (1 lb. in 10 gal.) instead of water.

THE following Press Notice was issued by the Food Production Department of the Board on 21st October :—

**The Damaged
Harvest: Need for
Testing of Cereals.**

In view of the large amount of damaged grain this season the Food Production Department would urge upon farmers the importance of having their cereals tested before relying upon them for seed purposes. Farmers desiring to send grain to the Food Production Department's Seed Testing Station to be tested are asked to forward their samples *immediately after threshing*.

Samples should not be less than 4 oz. in weight, and a fee of 3d. should accompany each sample; unless a declaration is required for the purpose of a sale, in which case the fee payable is 1s. per sample.

Envelopes for forwarding samples may be obtained on application to the Seed Testing Station, 70, Victoria Street, London, S.W. 1.

THE following Circular Letter (No. C.L. 47/S. 5) was addressed to Agricultural Executive Committees by the Food Production Department of the Board on 29th October :—

**Testing of Seeds
Order, 1918.**

SIR,—Representations have been made to the Department that the requirements of the Testing of Seeds Order* have not been adequately brought to the notice of farmers who are selling seeds to their neighbours. It is important that farmers should know the quality of the seed they sow, whether it be bought from a seed merchant or from another farmer, and I shall be glad if your Committee will do all they can to make known the requirements of the Order in your county.

The particulars which must be declared under the Order are set out fully in Food Production Leaflet No. 47, also in a shorter form in Notice No. F.P. 345/S. 5,† and still more briefly in a Poster (F.P.390/S.5), a copy of which is enclosed,‡ together with copies of the Leaflet and Notice.

It will be very helpful if your Committee will be so good as to arrange for copies of the Poster to be displayed on notice boards at markets and other suitable places. I shall be glad to send you supplies of this Poster, if you will let me know how many copies you can use fully exhibit. Copies of the Leaflet and Circular will be sent at your request for distribution as you may require them, to meet farmers' requests for copies. When you reply, please mark envelopes "Seed Control Section."

I am, etc.,
(Signed) LAWRENCE WEAVER.

THE following Notice was issued by the Food Production Department of the Board on 11th October :—

**Potato Spraying
Campaign.**

Between 1st November, 1917, and 1st August, 1918, over 14,500 knapsack and other spraying machines were bought in Great Britain for the purpose of potato spraying. These sales compare with 12,000 machines sold between 1st November, 1916, and 1st August, 1917. Roughly, the two years mentioned cover the period of the Food Production Department's spraying propaganda. The average pre-war sales of machines were less than 1,000 yearly. It will be noticed that in 1917, when the Department supplied machines direct to buyers, there was an increase of about 1,100 per cent. in the demand ; that this year, when the sprayers have been supplied through the trade, there has been a still further increase. These increases may fairly be attributed to the official propaganda in favour of spraying potatoes. The demand for horse-drawn sprayers for spraying either potatoes or charlock has also been materially stimulated by the lectures and demonstrations given by the Food Production Department. Between January and July this year 1,370 lectures and 947 demonstrations were given.

Spraying trials carried out at Christchurch offer significant evidence in favour of the efficacy of spraying. Scotch Up-to-Date seed was planted—the sets 16 in. apart in the rows, and the rows $2\frac{1}{2}$ ft. apart. The crop was lifted on 28th September, and the yields were :—1 rod, unsprayed : total weight, 287 lb. ; healthy tubers, 226 lb. ; blighted tubers, 61 lb. One rod, sprayed (three times) : total weight, 401 lb. ; healthy tubers, 345 lb. ; blighted tubers, 56 lb. Blight was general on the unsprayed land on 22nd August ; on sprayed land not until 17th September.

THE alarming spread of wart disease, or black scab, of potatoes in recent years—and especially in the past twelve-months—invests with a special interest this year's experimental work at Ormskirk, and the potato show at the same place, which was held on 30th October.

**The Wart Disease
Peril : Potato Show
at Ormskirk.**

It is generally known that for a number of years the Board of Agriculture have been conducting tests of the varieties of potatoes classified as "immune from wart disease" and endeavouring to discover new immune varieties. Outside trade and official circles, however, it is not fully realised on what an extensive scale and in how thorough a manner the investigations of the Board have lately been carried out.* Still less is the general public aware of the important schemes which are in hand for developing and systematising national research into the diseases which affect the plants of the farm, and in particular the potato. The large and representative gathering of growers, raisers, and

* See articles in this *Journal*, November, 1917, p. 801, and September, 1918, p. 713.

merchants attending the show on the 30th October, were able to see for themselves some part of the results already achieved; and Lord Bledisloe (until recently, Sir Charles Bathurst), in opening the show, explained briefly the plans of the Board for the future, whilst warmly commending to the support of his hearers the scheme for a National Institute of Agricultural Botany.*

In his address, Lord Bledisloe said that for five years past the Board of Agriculture had been conducting experiments with a view to the eradication of wart disease. These experiments were to be continued on a larger scale. The future of the potato-growing industry in this country was full of promise. During this War for the first time the Government of the day had begun to interest itself in the culture of the potato.

New Board of Agriculture Farm for Experiments.—The Board had recently purchased a farm for experimental purposes. The agricultural and industrial potentialities of the potato were practically unlimited, given a larger measure of research on the right lines and the co-operation of everybody concerned with the industry. It was proposed to make Ormskirk the permanent home for potato trials on a scale worthy of this country. The farm would cost anything from £5,000 to £10,000 properly to equip, but his Lordship was confident that the sum required would be subscribed by growers, raisers, and merchants interested in the encouragement of the cultivation of potatoes and cereals on up-to-date lines. He announced that Mr. Poad, of York, had contributed £500; Mr. Gardiner, of Perth, £100; and Mr. Alfred Birch, of Liverpool, £50. It is understood that numerous other promises of support to the National Institute of Agricultural Botany were subsequently made.

The Board of Agriculture have recently issued a revised edition of Leaflet No. 105 on Wart Disease, containing a life history of the fungus, a description of the methods by which the disease may be spread, hints on control measures, and a brief summary of the Wart Disease Order of 1918.† Free copies can be obtained from the Board of Agriculture, 3, St. James's Square, London, S.W. 1.

* See articles in this *Journal* July, 1918, p. 383, August, 1918, p. 519.

† Printed in this *Journal*, May, 1918, p. 211.

THE following Notice was issued by the Food Production Department of the Board on 25th October :—

The Supply of Seed Potatoes. The President of the Board of Agriculture having given careful consideration to the question of the distribution of seed potatoes of the 1918 crop in England and Wales, has decided that the Board shall leave the supply to the ordinary trade channels

It will be remembered that the scheme of distribution by the Food Production Department was introduced in the season 1916-17* when the supply of "seed" was extremely limited and in order to overcome the difficulties of the allotment holder and cottager in obtaining suitable potatoes for planting. This scheme was put into operation again in 1917-18† in order to demonstrate further the value of "seed."

Mr. Prothero is of opinion that the objects which the Department had in view have now been secured, and that the prospects of the present potato harvest yielding an ample supply of good "seed" are such as to remove the justification for the amount of Government interference involved in the distribution of "seed" by Agricultural Executive Committees during the coming season.

An Order relating to the sale and distribution of seed potatoes will shortly be issued by the Ministry of Food, by which maximum prices (a) paid to the grower and (b) charged by wholesale and retail dealers will be fixed for different classes and varieties. Under the Order it will be possible for small growers to obtain their requirements either direct from the grower or through ordinary trade channels. In any case, where a society or group of small growers finds difficulty in obtaining supplies the Department will be prepared to give information as to reliable sources.

The Food Controller has issued General Licences (Orders Nos.*1304 and 1303 respectively) under the British Onions Order, 1918,† and under the Imported Onions Order, 1918,‡ authorising persons who have dealt as retailers in onions and also persons who have purchased imported onions direct from a licensed broker to continue to do so until further notice. The Food Controller also postponed the dates by which brokers and grower dealers have to apply for registration until 1st November, 1918. Both the British Onions Order, 1918, and the Imported Onions Order, 1918 stand, however, so far as any other persons are concerned.

AN Order (No.1236), dated 1st October, 1918, has been made by the Food Controller fixing maximum prices of British Eating and Pickling Onions of the 1918 crop. The Order defines

The British Onions Order, 1918. "eating onions" as those which will not pass through a riddle having $1\frac{1}{4}$ in. mesh, and "pickling onions" as those onions which will pass through a riddle having a $1\frac{1}{4}$ -in. mesh. Onions must be sold by

* See this *Journal*, February, 1917, p. 1141.

† See this *Journal*, November, 1917, p. 900.

‡ See below.

§ Order No. 1210, 1918. Not printed in this *Journal*.

weight and pickle makers must not use eating onions for making pickles. It is an offence to sell British onions mixed with any other onions or to misrepresent or falsely describe British onions as imported onions or imported onions as British onions.

The maximum prices are as follows :—

EATING ONIONS.

Time of Delivery.	Growers' Maximum Price f.o.r. or f.o.b.	Retail Prices.		
		Sales of 1 cwt. or more, per cwt.	Sales of 1 st. or more, but less than 1 cwt., per stone	Sales of less than 1 st. per lb.
1918.	£	s.	s. d.	d.
Before and on 31st Oct.	28	34	4 5	4½
1st Nov. to 30th Nov. ..	29	35	4 6	4½
1st Dec. to 31st Dec. ..	30	36	4 8	4½
1919.				
1st Jan. to 31st Jan. ..	32	38	4 11	5
1st Feb. to 28th Feb. ..	34	40	5 2	5½
1st Mar. to 31st Mar. ..	36	42	5 5	5½
1st April and after ..	38	44	5 8	5½
PICKLING ONIONS.				
Any time	30	36	4 8	4½

Onions sold by growers not separated must, if sold for delivery on or before 31st December, be sold at prices applicable to eating onions, and after 31st December, at prices applicable to pickling onions.

The maximum wholesale dealer's profit is 5s. per ton, and if the onions pass through the hands of more than one wholesale dealer this profit must be shared.

Growers who carry on separate businesses as wholesale dealers may apply to the Director of Vegetable Supplies, 100, Cromwell Road, London, S.W. 7, for licences to sell their own onions as wholesale dealers. Onions may be sold by retail only by registered retail dealers in eating potatoes or by growers whose total crop of onions is not more than 1 cwt. Retail dealers may charge ½d. per lb. with a maximum of 2d. for delivery to consumers. This Order does not apply to shallots, potato onions, or to onion sets sold for planting. All contracts are cancelled, except in respect of deliveries prior to 7th October, 1918.

This Order came into force on 14th October, 1918

THE following Notice was issued by the Joint Committee of the Board of Agriculture and Ministry of Food on 16th October :—

At a meeting of the Central Agricultural

The Price of Meat and Offals.

Advisory Council, held on 17th September, the following resolution was passed :—

“ That it be a recommendation to the Food Controller to increase the price payable to breeders of cattle and sheep

for the offals of cattle and sheep sold by them on the dead-weight basis by the sum of $\frac{1}{2}$ d. per lb. carcass weight, or alternatively that breeders should be paid the wholesale prices realised for such offals."

We understand that this resolution has been given very careful consideration by the Food Controller and replied to as follows:—

The Food Controller regrets that the principle involved cannot be accepted. The price of 75s. per cwt. is exactly equivalent (or as near as can mathematically be computed) to the price of 1s. $0\frac{1}{2}$ d. per lb. for the meat, plus 2d. per lb. on the dressed weight for the offals, on a 10-cwt. beast yielding 56 per cent. If the farmer sells on the dead-weight basis, he gets this full 1s. $2\frac{1}{2}$ d. per lb., or, in other words, he gets the same return as if he had sold the same beast on the live weight basis. If an increased price is paid for offals it would therefore be equitable to pay a less price for the meat, otherwise the farmer would secure more for a beast on the dead-weight basis than he would by selling the same beast on its live weight.

AN Order (No. 1308), dated the 14th October, 1918, has been made by the Food Controller to the effect that —

**The Cattle Feeding
Stuffs (Distribution)
Order, 1918.**

1. *Restriction on Supplying or Obtaining Cattle Feeding Stuffs.*—A person shall not on or after the 17th November, 1918, obtain or attempt to obtain cattle feeding stuffs from any person or supply or attempt to supply any cattle feeding stuffs to any person except under and in accordance with the provisions of this Order.

2. *Power to Sell to Holders of Certificates.*—A person named as a supplier, in a certificate granted under this Order, may supply to the person therein named or referred to as the buyer, cattle feeding stuffs of the class or classes and up to the quantity and subject to the conditions mentioned in, or applicable under such certificate.

3. *Power to Holders of Certificate to Buy.*—A person named or referred to as a buyer in a certificate granted under this Order may obtain from the person named therein as the supplier, cattle feeding stuffs of the class or classes and up to the quantity and subject to the conditions mentioned in or applicable under such certificate.

4. *Cattle Feeding Stuffs to be Used in Accordance with Certificate.*—A person shall not use or permit to be used any cattle feeding stuffs obtained under a certificate granted under this Order except in accordance with the terms and conditions mentioned in or applicable under such certificate.

5. *Producers, Makers or Dealers not to Use Cattle Feeding Stuffs to Feed to Live Stock.*—(a) A producer or maker of or a dealer in cattle feeding stuffs shall not on or after the 17th November, 1918 (except under and in accordance with the provisions of this Order or of any directions given thereunder), use any cattle feeding stuffs produced, acquired or obtained by him in the course of his occupation, trade or business for the purpose of feeding his live stock.

(b) Nothing in this Clause shall prevent:—

(i.) A person who has made an application for a certificate under this Order from using for the purpose of feeding to his live stock any cattle feeding stuffs mentioned in such application as being in hand at the date thereof; or

- (ii.) A person from using for the purpose of feeding his live stock any cattle feeding stuffs which he might lawfully have obtained and fed to such live stock otherwise than under a certificate.

6. *Power to Food Controller to Grant Certificates.*—The Food Controller or any person authorised by him may grant certificates under this Order on such terms and conditions as he may from time to time determine and may revoke any certificate, and may from time to time by general or special notice vary the quantity or class of cattle feeding stuffs obtainable under any certificate or any class of certificate.

7. *Grading of Certificates.*—(a) Certificates granted under this Order may be graded by or under the authority of the Food Controller so as to give priority to any class of live stock over any other class of live stock, and for this purpose any class of live stock may be subdivided.

(b) Where certificates have been graded, a person shall in the disposition of any cattle feeding stuffs held by him have regard to the grades of the certificates upon which he is named as supplier, and shall not dispose of any cattle feeding stuffs to the holder of a certificate of a lower grade until all orders for cattle feeding stuffs properly demanded upon a certificate of a higher grade have been filled by him.

8. *Application for Certificates.*—Every application for a certificate shall be made in such a manner or on such form as may from time to time be prescribed by or under the authority of the Food Controller.

9. *Power to Food Controller to Give Directions.*—(a) Directions may from time to time be given by or under the authority of the Food Controller relating to—

- (i.) Records to be kept and returns to be made by any person who deals in cattle feeding stuffs or who has obtained any cattle feeding stuffs upon a certificate granted under this Order.
- (ii.) The endorsement on certificates of particulars of the class and quantity of cattle feeding stuffs supplied thereon, and
- (iii.) Any other matter in connection with the trade or business of any person dealing in cattle feeding stuffs.

(b) All persons concerned shall comply with any directions given by or under the authority of the Food Controller, and shall permit any person authorised by the Food Controller to inspect any records directed to be kept under this Clause.

10. *Saving Clause in Case of Maize, Maize Products and Poultry Mixtures.*—(a) Nothing in this Order shall prevent the sale and purchase without a certificate of maize or maize products (other than gluten feed, Paisley meal, maize germ meal and hominy chop) or of any horse mixture where the purchaser declares that he is buying for the purpose of feeding the same to any stallion used exclusively for stud purposes, or to any horse to which the Horses (Rationing) Order, 1918,* or any other Order made by the Food Controller restricting the amount of cereal foodstuffs to be fed to horses applies: provided that the purchaser shall use the same for the purpose of feeding a horse or horses of the classes specified above.

(b) Nothing in this Order shall prevent the sale and purchase without a certificate of any poultry mixture where the purchaser declares that he is buying for the purpose of feeding the same to any poultry, provided that the purchaser shall use the same for the purpose of feeding poultry.

(c) The Food Controller may at any time by notice under this Order direct that any declaration to be made for the purpose of either of the foregoing Sub-clauses of this Clause shall be made in writing.

11. *Provisions of Horses (Rationing) Order, 1918, to be Observed.*—Nothing in this Order shall be taken to authorise any cereal foodstuffs to be fed to horses in contravention of the provisions of the Horses (Rationing) Order, 1918, or any other Order of the Food Controller restricting the amount of cereal foodstuffs to be fed to horses.

12. *False Statements.*—A person shall not—

- (a) make or connive at the making of any false statement on any application or return made in connection with or for any of the purposes of this Order, or make or connive at the making of any false statement for the purpose of obtaining any cattle feeding stuffs, or obtain or attempt to obtain any cattle feeding stuffs, where any false statement has been made on the relative application ; or
- (b) without lawful authority alter or attempt to alter or forge any entry upon a certificate ; or
- (c) make or connive at the making of any false entry or endorsement on a certificate ; or
- (d) fail, neglect or connive at any failure or neglect to make any entry or endorsement on any certificate in manner directed thereon or required under this Order ; or
- (e) assign or attempt to assign any certificate or any cattle feeding stuffs obtained thereunder ; or
- (f) falsely represent himself to be a person to whom any such certificate applies or has been issued.

13. *Interpretation.*—For the purposes of this Order—

The expression " horse " shall include mare, gelding, filly, pony, ass and male.

The expression " cattle feeding stuffs " shall mean oil cakes and meals and other cattle feeding cakes and cattle feeding meals of every variety, millers' offals, millers' screenings, barley offals, oat offals, malt culms, brewers' grains, distillers' grains, maize, gluten feed, Paisley meal, maize germ meal, hominy chop and other maize products, molassed foods and mixtures containing any of the foregoing articles, but does not include dog biscuits or any of the foregoing articles which are suitable for human food.

14. *Exception.*—This Order shall not apply to—

- (a) the making or obtaining of a supply of cattle feeding stuffs proved to have been made to a person buying for the purpose of re-sale pursuant to this Order ; or
- (b) the making or obtaining of a supply of cattle feeding stuffs for the purpose of being fed to any horse owned by the Admiralty, Army Council or Air Council.
- (c) Sales of cattle feeding stuffs in quantities not exceeding 7 lb. in one week to or for the benefit of any person, except in so far as the Food Controller may direct that it shall apply ; or
- (d) Dealings in cattle feeding stuffs in Ireland for delivery in Ireland.

15. *Revocation.* S. R. & O. No. 7 of 1918.—The Cattle Feeding Stuffs (Priority Supply) Order, 1918,* is hereby revoked as at the 17th November, 1918, without prejudice to any proceedings in respect of any infringement thereof.

Mr. Wright asked the Food Controller whether he is aware of the general sense of dissatisfaction amongst home-producers of meat and milk at their failure to obtain supplies of concentrated feeding stuffs; and if he will state the reasons why these feeding stuffs cannot be obtained?

**Feeding Stuffs:
Question in
Parliament.**

Mr. Clynes: A certain degree of dissatisfaction is inevitable, but it should be realised that the shortage of concentrated feeding stuffs is due to the paramount requirements of the American military programme. Tonnage which would have been otherwise available for feeding stuffs has, by the decision of the Government, been allocated to the transport of American troops. So far as the President of the Board of Agriculture and myself are concerned, we could only accept this decision, which clearly tends towards shortening the War, and do everything in our power to remedy the difficulties with which the farmers were bound to be faced. We forthwith arranged a scheme for the equitable distribution of such feeding stuffs as were available, and with a view to encouraging the farmers to hold back their cattle at the present time, we propose to increase the prices for cattle and sheep as from December.

General Sir Ivor Philipps asked the President of the Board of Agriculture what is the approximate average price per 100 lb. which a farmer receives for wheat, barley and oats fit for human consumption delivered at corn-dealers' stores; what is the approximate average price per 100 lb. a farmer receives for wheat, barley and oats which is damaged and not fit for human consumption; what is the approximate average price a farmer has to pay for barley meal or compound prepared meals for cattle and pig feeding; and what is the approximate average cost to a farmer of hauling the above from farm to market per 100 lb. per mile?

**Wheat, Barley and
Oats: Question in
Parliament.**

The Parliamentary Secretary to the Ministry of Food (Major Astor): I have been asked to reply. The approximate average price per 100 lb. of home-grown wheat, barley and oats fit for human consumption delivered by the farmer to dealers' stores, in accordance with the custom of the district, is 15s. In case of delivery outside the accustomed range an additional charge of 9d. per ton per mile may be made for the extra distance. The approximate average price per 100 lb. of these articles when unfit for human consumption is 13s. 9d. The price of compound meals for cattle is controlled under Clause 1 (c) of the Cattle Feeding Stuffs (Maximum Prices) Order, 1918,† which prescribes that a manufacturer may only charge the actual cost of the ingredients used plus the cost of manufacture and profit, such addition not to exceed 30s. per ton. On this basis the maximum price for dairy meals ranged from £16 17s. 6d. to £17 5s. per ton according to the proportion of oil and albuminoids employed. The fourth part of the question is of a some-

* Printed in this *Journal*, February, 1918, p. 1307.

† " " " " March, 1918, p. 1474.

what hypothetical character. I may add that a new Cereal Meals Order is in preparation which should control more effectively the quality and price of cereal meals.

THE following Press Notice was issued by the Board towards the end of October :—

Since the Board of Agriculture in the spring urged both farmers and cottagers to keep pigs and encouraged the formation of pig clubs in urban districts where household waste could

**Shortage of Feeding
Stuffs: Advice to** be collected the situation has changed greatly for the worse.

Pig Keepers.*

Even at that time the Board felt it necessary to confine their encouragement to pig keepers who could provide the greater part of the food required either from household waste, garden produce, roots, vetches or other green crops of the farm.

Despite the increasing difficulties that were experienced in obtaining even a small allowance of concentrated feeding stuffs, a difficulty caused by the growing shortage of supplies, a large number of people throughout the country responded to the invitation of the Board and effected a substantial increase in the number of pigs.

It has now, however, become necessary to tell pig keepers that even the small allowance of concentrated food hitherto allotted to pigs may not be continued beyond 25th January, 1919.

Every possible ton of shipping space has to be spared to bring American soldiers and their supplies. To this broad decision of policy to force the War to an early and successful issue the Board of Agriculture must conform, much as it may deplore the difficulties it imposes upon owners of livestock. The result is that the small supply of feeding stuffs available must be strictly rationed, and the amount coming forward is only sufficient to supply the milch cows and calves, sows and pigs with a limited allowance. Even that allowance will soon begin to outrun the supply and pigs may have to be withdrawn from the favoured list after 25th January.

What is the pig keeper to do ?

The farmer has to command a certain quantity of home-grown food ; he may be able to spare some roots, he may have chat or damaged potatoes. With these and a small daily allowance of tail or damaged grain he can keep his pigs growing without even the allowance of offals to which he is entitled until January. No man ought to feed pigs on meal alone.

Pig clubs can still command the waste that is being collected ; with that and the allowance of offals they can still obtain they will be able to maintain their pigs until January. They must use their own judgment as to whether they can keep them any longer, or whether they must kill off some before that date in order to have food enough for the rest. Many cases are reported to the Board where pigs are being kept successfully on waste alone, and this is possible where the pigs are not too young. The cottager is, perhaps, in the worst case. He must do the best he can under his own circumstances. Up to January he can still buy offals, he has his small and damaged potatoes and a certain amount of waste and garden produce. He must get the pig on as far as he can with that and at the worst kill it before the supply gives out.

The Board are being constantly asked whether they want pigs kept. They want every possible pig kept, but they cannot promise any food

* See also p. 1029.

beyond January, and they, therefore, cannot advise anyone to continue to keep pigs who does not see some way of providing for them out of local resources. The price of pork and bacon is high and is not likely to fall, there will be a great demand for young pigs as soon as food becomes available again. These are the plain facts: the Board want pigs and believe in pig production, but cannot obtain any food for them from the outside. But they urge every pig keeper to make the best shift he can.

THE following Press Notice was issued by the Ministry of Food on 5th November :—

Slaughter of Pigs. As there seems to be considerable misunderstanding with regard to the attitude of the Ministry of Food on the subject of the killing of pigs, the Food Controller announces that there is no Order or instruction to the effect that pigs must be killed before Christmas or any other date. The misunderstanding appears to have arisen from the announcement that the Ministry could not guarantee that supplies of imported feeding-stuffs would be available for store pigs after Christmas. The reason for this was that the Government decided that, in view of the military situation, it was imperative to bring over as many American soldiers as possible to relieve the armies in the field, and, consequently, the imports of feeding-stuffs which had been arranged by the Ministry had to be drastically reduced. Meantime the National Salvage Council, on which the Ministry of Food is represented, is taking all possible steps to encourage the collection and utilisation of house and garden refuse for purposes of providing food for pigs.

Owing to the large supplies of home-killed beef and mutton at present available, it is not desired that pigs should be slaughtered if they can be fed. It has, however, been decided by the Food Controller to remove the restriction on the slaughter of pigs weighing less than 112 lb. live weight at the time of slaughter. Such pigs may be slaughtered on the farm or elsewhere with the consent of the Area Live Stock Commissioner. Self-suppliers do not, however, require such consent. The carcasses or carcasses and offals of such pigs, if intended for sale, must be sent to the Government authorised slaughter-house or bacon factory notified by the Live Stock Commissioner, where they will be bought and paid for at the controlled dead-weight prices if received in good condition, and distributed to butchers for sale against the ration or utilised in the bacon factory as the case may be.

THE new Pig (Sales) Order* and the instructions issued under it, provide a simple method for the disposal of the cottager's pig. He obtains a special postcard at any post office addressed to the Live Stock Commissioner for his area, notifying the fact that he has a pig for sale. Arrangements are then made to deal with the matter. Small owners should bear in mind that facilities cannot be given to any one man for sale, otherwise than through a market, of more than three pigs in one calendar year. (*National Food Journal*, 23rd October, 1918.)

THE following Notice, prepared in agreement with the Ministry of Food, was issued by the Board of Agriculture and Fisheries on 21st October, for the information of farmers :—

Damaged Grain: 1. Farmers possessing tail corn (wheat, rye, barley or dredge corn) or corn which, after threshing, they consider unfit for use as human food, must submit a sample to the Grain Officer of the district.

Notice to Farmers.* 2. If the Grain Officer accepts the sample as unfit for human food he will grant a licence to the owner enabling him to use the corn for feeding live stock subject to any restrictions imposed by the Horses Rationing Order† and other Orders issued by the Ministry of Food, and will advise the Live Stock Commissioner.

3. Any licence granted will incorporate a certificate entitling the farmer to sell in quantities of 10 cwt. or less at a time, but no certificate is required for the sale of larger quantities.

4. No farmer is compelled to sell tail or damaged corn passed by the Grain Officer, but if he does sell he may not accept more than a fixed maximum price for damaged grain, that is 7s. per qr. less than the price for undamaged grain.

5. A farmer who cannot obtain a licence to feed grain as tail or damaged corn is not compelled to sell at any price below the maximum. If he finds any difficulty in selling he should apply to the Grain Officer, who will obtain for him at the earliest opportunity the maximum price.

6. Farmers having badly-sprouted crops are recommended to stack separately, and in respect of such portion as is considered to be incapable of being threshed, should apply to the Grain Officer for a licence to feed, which may be granted or refused after inspection.

7. As regards crops which are badly sprouted or badly laid in the field, the Grain Officer, after inspection may grant a licence for feeding the whole or portion of the field, or where the grain has been cut may instruct the farmer to stack any portion of the sheaves separately for threshing, afterwards giving him a licence to deal with the rest for feeding.

8. This notice does not apply to oats. A farmer may feed a reasonable quantity of oats in the straw subject to any conditions imposed by Orders issued by the Ministry of Food or Army Council, but may not sell such oats except to the Army authorities.

9. Farmers are urged to hold their out-of-condition grain as long as possible in the stack so that it may become mature, and the maximum quantity thereby retained for human food.

THE Food Controller, by an Order (No. 1309), dated 14th October, 1918, has made the following amendment to the Dredge Corn Order, 1917‡ :—

**Order Amending
the Dredge Corn
Order, 1917.**

In Clause 2 (a) of the Principal Order, the words ' the Grain (Prices) Order, 1918,' shall be substituted for the words " the Grain (Prices) Order, 1917."

* See also The Cereals (Restriction) Order, 1918, printed in this *Journal*, September, 1918, p. 745.

† See next page.

‡ Order No. 1182 of 1917. Printed in this *Journal*, December, 1917, p. 1028.

AN Order has been issued by the Army Council providing that :—

1. Producers having in their possession unthreshed oats grown by them may use a reasonable quantity as feed for their own stock.

Regulation of the Sale and Use of Unthreshed

Oats in Great Britain. 2. Farmers desirous of purchasing unthreshed oats must make application to the District Purchasing Officers for Supplies* of the county or district concerned for a licence to do so, stating the name and address of the producer from whom they desire to purchase the same and the quantity required. Such unthreshed oats must not be used for any purpose other than the consumption by stock in the purchaser's possession, and must not be re-sold.

3. The above are the only instances where the consumption of unthreshed oats is permissible, outside possible Army requirements.

AN Order (No. 1331), dated 17th October, 1918, has been made by the Food Controller to the effect that :—

The Horses • (Rationing) No. 2 Order, 1918. 1. No person shall feed any horse or permit any horse to be fed with cereal foodstuffs except as provided in this Order, or under the authority of the Food Controller.

2. This Order shall not apply to horses falling within the classes mentioned in the First Schedule.

3. Horses falling within the classes mentioned in the Second and Third Schedules may not on any day be fed with more than the quantity of cereal foodstuffs prescribed for such horses in the Schedules, or in such other Schedules as may from time to time be prescribed by the Food Controller for the purposes of this Order.

4. The maximum quantity of cereal foodstuffs which may be fed on any one day is prescribed in the Schedules in terms of oats, but other cereal foodstuffs may be used in lieu of oats, and if so used they shall be deemed for the purpose of this Order to be the equivalent of oats in the following proportions :—

7½ lb. maize=10 lb. oats.

9 „ beans=10 lb. oats.

9 „ peas=10 lb. oats.

12 „ brewer's grains=10 lb. oats.

13 „ bran or other miller's offals=10 lb. oats.

12 „ any horse mixture not containing hay or straw chaff=10 lb. oats.

10 „ any other cereal foodstuffs which may lawfully be fed to a horse=10 lb. oats.

The allowance for brewer's grains is for dry grains—4 lb. of brewer's grains obtained wet may be used in lieu of 1 lb. of dry brewer's grains.

5. Horses falling within the classes mentioned in the Fourth Schedule may not be fed with any cereal foodstuffs.

6. Any person or persons in possession of a horse or horses to which this Order applies shall keep a record in writing in sufficient detail to show (1) the number of horses kept by him in each class referred to in Schedules II and III, (2) the total maximum rations authorised by this

* A list of the addresses of these officers was published in this *Journal*, September, 1918, p. 749.

Order, (3) the description and quantities of the cereal foodstuffs fed to such horses per week, and (4) the description and quantities of all cereal foodstuffs purchased and the date of such purchase; such records shall at all reasonable times be open to inspection by an officer or constable of police or any person authorised by the Food Controller, or the Controller of Horse Transport.

7. For the purpose of this Order :—

“ Horse ” shall include mare, gelding, colt, filly, pony, mule, and ass

“ Cereal foodstuffs ” shall include all grains, and beans and peas, and products thereof, and mixtures containing any such articles.

8. The Horses (Rationing) Order, 1918,* is hereby revoked as at the 21st October, 1918, without prejudice to any proceedings in respect of any contravention thereof or to any exemptions granted thereunder.

This Order came into force on the 21st October, 1918.

NOTE.—The amount of hay which may be fed to horses in Great Britain is restricted by an Order of the Board of Trade called the Hay and Straw Order No. 3, 1918 (S.R. & O. No. 1216) of 1918.† No restriction is placed by this Order or by the Board of Trade Order on the use for feeding purposes of straw or roots. •

Schedule I.

Horses excluded from the operation of this Order :—

- (a) Horses owned by the Admiralty, the Army Council or the Air Council.
- (b) Horses maintained and used exclusively for agricultural purposes.
- (c) Stallions used exclusively for stud purposes.

Schedule II

Horses solely or mainly used for trade or business purposes to be rationed :—

Class of Horse.	Maximum Daily Ration in Terms of Oats.	
	When in Hard and Continuous Work.	When not in Hard and Continuous Work.
(a) Heavy dray and cart horses and heavy trotting vanners	1b. 16	1b. 12
(b) Light dray and cart horses and light trotting vanners	14	10
(c) Other light horses and cobs	12	9
(d) Ponies 14 hands and under	7	5

Notes.

† (1) The jobbing out of horses is not in itself a trade or business purpose within the meaning of this Order.

(2) Pit ponies, working in the pits or at the pit mouth, may be given 4 lb. extra per day.

(3) Pit horses, working in the pits or at the pit mouth, may be given 2 lb. extra per day.

(4) Horses regularly engaged in work at a slow pace, not involving heavy loads and allowing of frequent intervals of standing, should be regarded as not in hard and continuous work.

* Printed in this *Journal*, May, 1918, p. 231.

† Printed in this *Journal*, October, 1918, p. 891.

Schedule III.

Horses not used for trade or business purposes to be rationed :—

<i>Class of Horse.</i>						<i>Maximum Daily Ration in Terms of Oats.</i>
(a)	Brood Mares	7 lb.
(b)	Weaned Foals	6 "
(c)	Yearlings :—					
	1st January to 31st May	6 "
	1st June to 31st August	3 "
	1st September to 31st December	6 "
(d)	Two and three year olds :—					
	1st January to 30th April	7 "
	1st May to 31st October	3 "
	1st November to 31st December	7 "
(e)	Entire thoroughbreds, two years old and upwards, not used for stud purposes					7 "
(f)	Hunters, not less than 14.3 hands, between the ages of 4 and 12 years (both inclusive), regularly hunted, sound, and suitable for military service as (a) officers' chargers, (b) cavalry troop horses, or (c) artillery riding horses; such horses being the property of (1) the master or committee of a recognised pack of hounds, or of (2) recognised followers living within the limits of the hunt. The horses to be registered by the master or his authorised deputy, who shall notify the owners of the horses and the Controller of Horse Transport, 7, Whitehall Gardens, S.W. 1, of such registration. Horses so registered are liable to be called up by the Army Remount Department at any moment.					6 lb. from 1st Oct. to 31st Oct.; 10 lb. from 1st Nov. till end of season.
(g)	Racehorses registered with the Controller of Horse Transport, 7, Whitehall Gardens, S.W. 1, for the purposes of the limited racing scheme					13 lb.

Note.—The age of a horse is to be reckoned as beginning on the 1st January of the year in which the horse was foaled.

Schedule IV.

Horses not to receive any cereal foodstuffs :—

Horses not falling within any of the classes mentioned in Schedules I., II., III., including :—

- Racehorses, hunters and thoroughbreds, other than those specified in Schedules I. and III.
- Carriage horses, hacks, char-à-banc horses, polo ponies, including all horses let out on hire for these purposes, and horses used in entertainments.
- Horses mainly used for other than business or trade purposes including all horses let out on hire for other than these purposes.

Note.—Correspondence with respect to this Order should be addressed to the Controller of Horse Transport, 7, Whitehall Gardens, S.W.1.

THE following Notice was issued by the Food Production Department of the Board on 18th October :—

Horse chestnuts may be profitably utilised as food for farm stock. They are similar in composition to acorns but are appreciably richer in carbohydrates. While some classes of stock will eat them in the raw state, the bitter principles and other ingredients which they contain cause them, unless specially treated, to be

* A note on Horse Chestnuts as Fodder was printed in this *Journal*, July, 1918, p. 451. See also this *Journal*, September, 1914, p. 511, an article on "The Value of Acorns, Horse Chestnuts and Beech Mast as Food for Stock."

refused by some animals. In this fresh state they are poisonous to fowls, ducks, and geese.

In the fresh condition, however, they are well suited for sheep and goats, to whom the bitter principles referred to would appear to be actually beneficial. To sheep they may be fed crushed in quantities of 1 lb. per head per day, well mixed with chop or green food. Ewes with lambs should not be given more than $\frac{1}{2}$ lb. per day.

Cattle will also readily take the crushed fresh nuts, but they *must* be crushed; and as much as 20 lb. per head per day has been fed to fattening cattle, although 12 lb. is more usual and a safer ration. Accounts differ as to the use of fresh chestnuts for dairy cattle, but they are on the whole not recommended.

Horses, if they can be induced to eat chestnuts in the fresh crushed state, may take them up to 6 lb. per head per day.

In all cases it is desirable to correct the binding tendency of the chestnuts by a liberal use of green food or other laxative material, such as roots or silage, to which chestnuts have proved a very satisfactory supplement. The use of salt also corrects their binding effect. Provided that this effect be prevented, it is claimed that chestnuts exercise a beneficial influence medicinally. They should also be of value for feeding together with oil-cakes rich in protein.

Pigs will not take fresh horse chestnuts, but will take them in the form of meal mixed with other foods up to 1 $\frac{1}{2}$ lb. per head per day.

Chestnuts should be allowed to fall before being harvested.

To prepare the meal the nuts should be dried by spreading out in a thin layer and occasionally turning. The drying should be completed (if possible, but not necessarily) in a hop oast or similar appliance in which the temperature can be raised to 160° F. They should then be husked and roughly crushed, soaked for 24 hours in one or two waters, or in a running water, and then boiled for about half-an-hour. The water should then be drained off and the residue dried and reduced to a meal, which in feeding value will be roughly equivalent to barley or maize.

Wherever practicable, and especially where it is desired to feed large quantities of chestnuts, it is desirable for all classes of stock that such a meal should be prepared.

Mouldy chestnuts or meal made from mouldy chestnuts should, of course, never be fed.

Mr. Wright asked the President of the Board of Agriculture whether, in view of our dependence hitherto upon the German Empire for the supplies of potash necessary for good cultivation, any and what steps have been taken by the Government to ascertain if potash can successfully be recovered on a commercial scale as a by-product from the manufacture of cement and pig-iron?

Potash: Question in Parliament.

Mr. Kellaway: A scheme for recovering potash on a commercial scale from the blast furnaces used in the manufacture of pig-iron was approved last year. In consequence the Ministry has encouraged the installation at various iron works of gas-cleaning plant designed to extract from the furnace gases potash-bearing dust. Certain of these plants are now in operation, others are under erection, while others, again, are in course of construction. A factory has also been erected

at which muriate of potash, free from deleterious impurities, is being manufactured from such dust. This factory is capable of dealing with all the dust that can be collected by the gas-cleaning plants now under erection and construction. As other gas-cleaning plants are installed it is proposed to erect other factories in suitable localities. A small amount of potash is also being obtained as a by-product of the cement industry, and experiments are, at the present time, being carried on with a view largely to increase the amount so recovered.

AN Order (No. 1334), dated 18th October, 1918, has been made by the Food Controller to the effect that :—

1. (a) In clauses 3 and 4 of the Principal Order* the words "2s. 3½d. per lb." shall be substituted for the words "2s. 1½d. per lb." and the words "2s. 3d. per lb." shall be substituted for the words "2s. 1d. per lb."

(b) In clause 6 of the Principal Order the words "2s. 6d. per lb." shall be substituted for the words "2s. 4d. per lb."

2. The Notice dated 16th September, 1918,† prescribing certain prices for Government butter shall cease to have effect as from the 20th October, 1918.

EARLY in October a number of newspapers published on the authority of a Surrey correspondent a statement to the effect that "thousands of rabbits" were dying in Surrey and other counties from "a mysterious disease." In some quarters it was suggested that the disease was "fluke"; in others that it was "a new disease."

It is perfectly true that a certain number of deaths has been reported by rabbit-keepers in different parts of the country; possibly the total of such deaths may have run into "thousands," although no precise figures are available on this point. In relation to the number of rabbits that are now being kept, and on the whole kept successfully in this country, however, the losses reported are negligible.

It is estimated that at present there are at least ten times as many tame rabbits in England and Wales as there were twelve months ago. It is only to be expected that, since the majority of these rabbits are owned by persons who had never reared a rabbit before the national rabbit-keeping propaganda started, and since have experienced a rather unfavourable season and difficulty in obtaining good hay in many places, there should be a percentage of deaths. It is very significant, however, that whilst many novices, including school children, soldiers at the Front, inexperienced women and others, have written to the National Utility Rabbit Association (124, Victoria Street, S.W. 1) telling of their success as breeders or rearers of rabbits, no serious loss has been notified by any beginner who has followed the instructions given in Leaflet No. 265, a copy of which may be obtained free of charge on application to the Board of Agriculture, 3, St. James's Square, London, S.W. 1

* Order No. 976 of 1918. Printed in this *Journal* September, 1918 p. 759.

† Order No. 1164 of 1918. This Order has not been published in this *Journal*.

The disease from which the rabbits referred to in the Surrey report apparently died is neither new nor mysterious. It is called Coccidiosis. Young animals are particularly liable to this disease, which affects the liver. There is no known cure, and animals suffering from a bad attack should be killed and burnt. The parasite of the disease is extruded from the bowels of an affected animal; at first it is not infectious, but it becomes so in a few days.

The *preventive measures* advised are (1) special cleanliness—the hutch being cleaned out, if possible, every day and any contaminated bedding removed; (2) care in feeding—so that the rabbits eat no contaminated matter; and (3) the supply of twigs for the animals to nibble. It may be explained that practically all rabbits harbour the parasite of the disease, but it is only through repeated infection from the consumption of foul matter that “the disease stage” is reached.

It is suggested that the danger of bowel or liver trouble in rabbits may be minimised by an avoidance of the feeding of wet, frosted, or stale greenstuff. If weeds or vegetable waste are wet when gathered they should be dried by being laid out thinly before feeding; if dirty, these and roots, which form the bulk of the winter food, should be cleaned before feeding.

Broadly speaking, a 6-lb. rabbit should have 2 oz. of hay and 10 oz. of green food or roots per day. The authorised ration for a rabbit is 1 lb. of hay per week. This can be obtained from any licensed dealer in hay by anyone who has registered as a rabbit-keeper.

THE following Notice was issued by the Food Production Department of the Board on 18th October:—

The National Rabbit Scheme Interesting Developments.

The National Rabbit Breeding Scheme has been taken up by nearly every county in England and Wales; and in some counties as many as ten breeding centres have been formed. Since the formation of the National Utility Rabbit Association a considerable amount of spare work has been done, especially in proving to the general public that tame rabbits do not taste “hutchy”; are in fact the same as the “Ostend Rabbit,” and in convincing breeders that rabbits can thrive on food other than corn, oats, middlings, and bran. Before the opening of the doe-centres in different parts of the country the Association managed to put upwards of 3,000 would-be purchasers and sellers in touch with one another. Advice has been given continually as to the best methods of breeding, the diseases of rabbits, and their care, the best methods of forming clubs, etc. The Association has also arranged with the Food Production Department to approach the Ministry of Food with a view to securing sufficient rabbit food for the winter for members affiliated to the Association. The big depot at Neasden has now been stocked with hutches and rabbits, and demonstrations will shortly be held there showing how to kill and skin rabbits.

One Hundred and fifty-six doe-centres have been formed in different parts of England and Wales; and a scheme has been organised which will enable members of the National Utility Rabbit Association to purchase from their nearest centre rabbits for stud purposes, to hire stud bucks, to obtain material for hutches, certain foods, advice, etc. Through these centres members will also be able to dispose of their

surplus stock and rabbit skins. Certain days have been fixed for killing paunching and skinning rabbits; the rabbits and skins will then be packed and despatched to markets.

Promises have been obtained from furriers to take all skins at higher prices than have usually been obtained by rabbit-keepers. The question of dyeing the skins for furs is receiving attention.

THE following Notice was issued by the Food Production Department of the Board on 11th October :—

**Tame and Wild
Rabbit Prices.**

The Food Production Department has been in communication with the Ministry of Food regarding the question of the price of tame rabbits; and it has been decided that for the present the price of these should not be fixed. A large number of people apparently believe that the Order fixing the price of wild rabbits applies also to tame rabbits. This is not the case. The Ministry of Food has not fixed the price for tame rabbits.

It would certainly not be fair to a breeder if he has to sell his tame rabbits at the same price as the rabbit catcher sells wild rabbits. Moreover, the flesh of the well-kept tame rabbit is superior in taste to that of the wild rabbit.

THE following Notice was issued by the Food Production Department of the Board on 25th October :—

The Rat Evil.

During the past eighteen months the Food Production Department has been encouraging the formation of Rat Clubs and in other ways endeavouring to combat the damage caused by rats to cereals in store. The Ministry of Food has now issued the Rats Order, 1918,* wherein local authorities charged with the administration of the Order are instructed to give due regard to any recommendations of the Board of Agriculture or a local War Agricultural Executive Committee. In view of the enormous amount of damage done by rats, the Food Production Department asks Executive Committees to call the attention of the local authorities to any cases in which action should be taken under the Order, and in all possible ways to co-operate with these authorities in making the Order effective.

THE following Notice was issued by the Food Production Department of the Board on 25th October :—

**Birds and Grain :
Official Advice on
Dressing.**

The usual dressings used to protect seeds corn from birds are made from tar. The different kinds of tar vary in usefulness and the Food Production Department have recently had tests of different tar dressings made at Rothamsted. No dressing tested gives absolute protection; most of them injure the seed unless carefully used. But when wheat is sown late in the autumn or grain is sown early in spring, rooks and other birds may cause so much damage that seed should be dressed.

The best form of tar that has been tested is *acetone tar*. This is only supplied by the Ministry of Munitions (Propellants Branch, 32, Old Queen Street, London, S.W. 1), and in quantities of not less than one barrel (40 gal.). It is produced in Essex, and in the Forest of Dean, Gloucestershire; and the current price is about 80s. per barrel at the works. To secure this product farmers who do not require a 40-gal. cask should combine and secure delivery of a barrel through a dealer. The method of treatment is to sprinkle 1 pt. of tar on 4 bush. of grain, and to turn the seed over and over until the tar is uniformly distributed. If spread out the seed should dry in a day. If the tar is too thick for handling (as it is in very cold weather), it must be warmed before use. This may be done by standing the vessel containing the tar in hot water.

Ordinary coal tar is often used for dressing seed; but it is rather variable in nature. It is not so protective nor so safe to use as acetone tar. If, however, the coal tar usually met with is used as follows, the risk of injury to seed is slight. One pint thinned down with one-quarter to one-third its volume of paraffin and stirred well may be applied to 6 bush. of grain in the same way as acetone tar. Great care must be taken to obtain an even distribution of the tar, otherwise it will have a harmful effect on the grain. This may be dried off with lime.

In dressing seed by either of the above methods, the most important point to remember is that the mixing should be thoroughly carried out, and the mixture be used as directed. The material will then have little or no adverse effect on the germination of the grain.

Mr. Maurice Healy asked the Food Controller on 29th October whether he had received a resolution from the Committee of the Cork City and County Bee-keepers' Association

**Bee Food: Question
in Parliament.**

claiming that bee-keepers should receive the same facilities for the purchase of sugar as is given to the fruit growers, and whether he is prepared to accede to this request?

Mr. Clynes: The resolution referred to in this question has been received by the Food Controller. Arrangements have been made to increase the supplies of bee candy, and a system of rationing the supplies of bee food to bee-keepers is in contemplation. It is not considered advisable to issue for use as bee food sugar which is suitable for domestic consumption.

Mr. Wright asked the President of the Board of Agriculture on 29th October whether a cow or heifer injected with the Board's anti-abortion vaccine, which is supplied free to

Anti-Abortive Vaccine: farmers who apply for it, remains a carrier of the germ of epizootic abortion, though immune herself, and liable to infect other animals;

and, if so, for how long?

The President of the Board of Agriculture (Mr. Prothero): The reply to the first part of the question is in the negative. The second does not, therefore, arise.

No further cases of Foot-and-Mouth Disease have occurred in East Sussex or elsewhere since those recorded in the *Journal* for last month.

**Foot-and-Mouth
Disease.**

The restrictions on the movement of animals which were imposed by the Board in consequence of those cases were gradually modified and were finally revoked by an Order of the Board which came into operation on the 11th November.

SINCE the Notices which appeared in last month's *Journal* respecting cases of Rabies in Devonshire, the number of outbreaks has unfortunately continued to increase almost daily, the total number of animals in which the disease has been confirmed now standing

Rabies.

at 71, whilst there are still 39 suspected cases under investigation. The majority of the cases have occurred in Plymouth and the immediate vicinity, but there have also been disease centres at Modbury, Ivy-bridge, and Tavistock in Devon, and at Fowey, Launceston, Wade-bridge, Bodmin, St. Mellion, Probus and Penzance in Cornwall. In the Launceston case the dog had travelled from Okehampton, a distance of some 15 miles.

Owing to the length of time that Rabies was in existence in Cornwall and Devon before it was reported to the Board, there is still a grave risk that the disease has been carried to other parts of the country, although no cases have yet been confirmed outside the two counties mentioned. The appeal twice made by the President to persons who had visited Devon and Cornwall during the summer months accompanied by dogs to notify the Board and to place their dogs under detention on veterinary premises, has met with a response in 29 instances only. As there must have been many more, it is hoped that the owners will in the interests of the public as well as in their own interest follow the course advised. Human life is at stake. At least 22 persons are known to have been bitten, 9 being children, and all of these have been sent to Paris for treatment at the Pasteur Institute.

As regards the measures taken by the Board to prevent the further spread of the disease, the whole of Devon and Cornwall is now subject to muzzling regulations, and no dog can be moved out of those counties except with a licence of the Board and subject to the condition that the dog must be detained and isolated on approved veterinary premises for four months.

AN abridged Annual Report of the Chief Veterinary Officer of the Board for 1917 has just been issued. Copies may be obtained from H.M. Stationery Office, Imperial House,

**Annual Report of
the Chief Veterinary
Officer of the
Board for 1917.**

Kingsway, London, W.C. 2, price 2d. net, excluding postage. The Report deals with the outbreaks of swine fever, glanders, anthrax, sheep scab and parasitic mange during 1917. The number of suspected outbreaks of *Swine Fever* reported was 10,261, and the

number confirmed by combined inquiry in the field and at the Board's laboratory was 2,104. This is a decrease of 2,227 as compared with 1916. Twenty-five outbreaks of *Glanders* among civilian horses are reported, which shows a decrease of 19 as compared with 1916. In regard to *Anthrax*, reports were received in relation to 2,229 suspected outbreaks, of which 423 were confirmed by tests for diagnosis at the Board's laboratory—201 in England and 222 in Scotland. Notification of *Sheep Scab* was received in 604 cases, occurring in premises which were declared infested places by service of separate detention notices. Disease occurred in 34 counties in England, compared with 24 in 1916, 25 counties showing an increase and 9 a decrease in the number of outbreaks compared with 1916. *Parasitic Mange* is only briefly mentioned in the Report, but it is stated that owing to war conditions, the disease has shown a tendency to spread.

The following is a PRELIMINARY STATEMENT showing the ESTIMATED TOTAL PRODUCTION OF HOPS in the years 1918 and 1917, with the ACREAGE AND ESTIMATED AVERAGE YIELD per STATUTE ACRE in each COUNTY OF ENGLAND in which Hops were grown. It is dated 17th October, 1918:—

COUNTIES, &c.		Estimated Total Produce.		Acreage Returned on 4th June.		Estimated Average Yield per Acre.	
		1918.	1917.	1918.	1917.	1918.	1917.

TOTAL	..	130,272	220,719	15,666	16,946	8.32	13.02

NOTE.—The total production of hops this year amounts to 130,272 cwt., or about two-fifths of the average production of the last ten years, on an area which has been reduced to less than half the pre-war average. The yield per acre (8.32 cwt.), while 4½ cwt. less than last year, is, however, only 1½ cwt. short of the average.

* A Preliminary Statement, showing the acreage of hops in England and Wales in 1918, was printed in this *Journal*, September, 1918, p. 765.

THE following Notice was issued by the Food Production Department of the Board on 11th October :—

**Educated Women
for Forestry.**

Forestry is among the most delightful forms of outdoor work for strong young women. A number of women are required for training as forewomen for forestry work at once. During training they will receive 24s. per week, out of which they will have to pay for their board and lodging. After training they will receive 25s., rising at the end of three months to 27s., and when efficient to 30s. They must have had a good education and should apply to the Food Production Department, 72, Victoria Street, London, S.W. 1.

THE Ministry of Food have recently issued a 24-page pamphlet entitled "How to Feed the Family," which contains some very useful information for householders. It gives a number of war-time recipes, with the prices of different articles of food and the food value of various articles of dietary. Copies of the pamphlet may be obtained gratis and post free on application to the Literature Distribution Section, Ministry of Food, Room 605, Palace Chambers, Westminster, London, S.W. 1.

IN view of the importance of maintaining an even supply of fat cattle and sheep for consumption, and to meet the extra expenses incurred by farmers in holding back stock, the Ministry of Food has decided to increase in December by a further 1s. per live cwt. the price to be paid for cattle for slaughter, making the price of super first-grade cattle 78s. instead of 76s. as at present, and also gradually to increase the prices already announced for both fat sheep and first-grade cattle as from 1st February. The highest point in the new scale will be reached in May, when the price of first-grade beasts will be 10s. per live cwt. above to-day's prices, returning by gradual decreases to to-day's prices in August and September of next year.

These prices are intended to encourage the winter feeder to take immature beasts from summer grazing districts, and to reduce the numbers of cattle at present being offered for slaughter. The Ministry of Food is fully alive to the desirability of slaughtering all cattle as far as possible as they become mature, and steps have been taken to deal with the maximum number coming forward that can be disposed of. In order to conserve supplies for the winter and spring months, however, the Ministry of Food is bound in the national interests to limit the

* Reprinted from *Weekly Notes*, No. 18, issued by the Joint Committee of the Board of Agriculture and the Ministry of Food.

number of cattle accepted for slaughter both from Great Britain and from Ireland.

It is hoped that these increases will be covered by the recent changes, in the retail prices, and that there will, therefore, be no necessity to add to the cost of meat to the public.

All inferior cattle will be placed in the fourth grade, and will be sold by auction at prices not exceeding the maximum prices in force for the time being, or may be sold on the dead-weight basis as set forth in Circular Letter to Area Livestock Commissioners No. 192.* No cattle in the fourth grade will be covered by the Central Live-stock Insurance Scheme.

If, in the opinion of the person grading a beast, it is likely to yield an unusually small or large proportion of bone, the above prices may (except in the case of fourth-grade cattle) be varied by 1s., 2s. or 3s. more or less, but in no case shall the price for the first grade be exceeded by more than 1s. per cwt. for bulls, bullocks, and cows in excess of the maximum prices in force for the time being.

THE Food Production Department announced on the 15th November that the War Office have issued general instructions that all threshing-machine drivers, irrespective of **Soldiers for Threshing.** category, now with the Home Forces are being released immediately on agricultural furlough. This arrangement will affect from 250 to 300 men, who will be distributed from the centres serving their counties of origin. It is believed that the release of these men by way of supplement to the labour resources already at the disposal of farmers will relieve the latter of any anxiety they may have felt as to the threshing of this year's crops.

**Agricultural Returns
of England and
Wales, 1918:
Produce of Crops.**

PRELIMINARY statement, dated 11th November, 1918, showing the estimated total produce and yield per acre of the corn, pulse, and hay crops in England and Wales in the year 1918, with comparisons for 1917, and the average yield per acre of the ten years 1908-1917.

* Mixed Corn was apportioned in previous years among Wheat, Barley and Oats.

† Hay from Clover, Sainfoin, and Grasses under rotation.

‡ Hay from Permanent Grass.

NOTE.—The yield per acre of all the corn crops in England and Wales this year is above the average, and with the single exception of the small area of beans, the total production is also greater; while all are better, whether judged by the yield from an acre or by total production than in 1917. The yield of wheat is estimated at 33 bush. per acre (2 bush. above the average), and the total production, upon the greatly increased acreage, amounts to 10,534,000 qr., which is the largest quantity harvested since estimates were first officially collected in 1885, and exceeds last year's total by 3½ million qr. Special reports received from the Board's Crop Reporters indicate that a certain proportion of the wheat has been damaged, especially in the northern districts and in Wales, but the condition of the bulk is satisfactory. Barley has yielded 32½ bush. per acre, or half-a-bushel more than the average; the total production of over 6 million qr. is the largest since 1914. The production of oats is almost 2 million qr. more than the previous highest on record (1907), and amounts to 14,336,000 qr.; the yield of 41½ bush. per acre is the best since 1910. Mixed or dredge corn, distinguished for the first time, produced an additional 620,000 qr. from 139,000 acres. The damage to barley and oats has been considerably more serious and widespread than in the case of wheat. Beans have given 29½ bush. to the acre, while peas, with 27½ bush., show the best return of the last ten years. Taking all the five corn crops together the gross production in England and Wales was no less than 8½ million qr., or quite 35 per cent., more than in 1917.

The yield of seeds' hay (clover, sainfoin and grasses under rotation) is practically equal to the average, viz., just 29 cwts. per acre; but that from the permanent grass (21½ cwt.) is ⅔ of a cwt. below the average. Owing to the increased production of corn, the total amount, viz., almost 2,100,000 tons of seeds and nearly 4,700,000 tons of meadow hay, is less than that taken last year, in spite of the better yield per acre. The total production of hay of both kinds amounts to 6,785,000 tons, or fully three-fourths of a million tons short of last year's total, and nearly 1,100,000 tons less than the average from the much larger area of the ten years 1908-17.

The estimate of the hop crop was issued on the 17th ult.; the returns of the production of potatoes and roots are collected at a later date, and will be issued subsequently.

In the course of a speech in the House of Commons on 13th November, the Food Controller said:—

Supplies of Feeding Stuffs.

"In view of the change in the food situation, the restriction on the slaughtering of young pigs has been withdrawn. Instructions will now be given that in the allocation of additional feeding-stuffs care shall be taken that cottagers and those who have joined pig clubs can secure a sufficient quantity of offals to enable them to fatten their pigs. Several relief measures have been taken. The price of cattle and sheep will be increased as from December on a graduated scale. The highest point will be reached in May, when the price will be 85s. per live cwt. That was a measure of mere justice, providing reasonable compensation to farmers who were obliged to keep back their cattle at a time when we could not guarantee feeding-stuffs for them and at a time when, had we counselled any increased ration, we should have endangered our prospects of even a slender ration during the beginning of next year.

"The second measure that we propose to take—it has been authorised and approved by the Cabinet only this week, which shows that we have been urging these matters forward as well as we could—is in order to deal with the present heavy surplus of cattle from the grazing districts, estimated approximately at 18,000 head per week. Supplies have been first taken from these districts, and the markets in arable districts have been temporarily closed to local supplies. These markets are being supplied from adjacent grazing counties. Further, the use of barley for feeding-stuffs has been sanctioned by the Cabinet during the course of the day.

"Arrangements are now being completed to release to the farmer 20 per cent. of each thrashing of barley, the remainder being allocated to manufacturers, distilling, munition purposes, and stock-owners who do not grow barley. On a rough estimate, this should make no less than 3,000,000 qr. of food available for the feeding of stocks. Again, in order to assist pig-owners, the prohibition of the slaughter of pigs weighing less than 112 lb. live weight, as I have intimated, has been withdrawn. The steps taken as regards closing markets in arable districts I have already announced, and they are quite in accordance with the recent recommendations of the War Emergency Committee of the Royal Agricultural Society. As a result of the relief in the tonnage situation afforded by recent military events, the Cabinet have sanctioned a reduction of the percentage of flour to be extracted from wheat. This alone will mean a release approximately of 18,000 tons of offal weekly to the farmers—food which will be in every respect finer than that commonly used."

MISCELLANEOUS NOTES.

THE *International Crop Report and Agricultural Statistics* for October, 1918, published by the International Institute of Agriculture,

Notes on Crop Prospects Abroad.

gives particulars concerning the production of the cereal crops of 1918 in certain countries in the Northern Hemisphere. *Wheat*.—The production in Spain, Great Britain, Italy, Luxemburg, Switzerland, Canada, United States, British India, Japan, Egypt, and Tunis is estimated at 250,233,000 qr. in 1918, against 210,086,000 qr. in 1917, or an increase of 19·1 per cent. *Rye*.—The estimated production in Spain, Italy, Luxemburg, Switzerland, Canada, and United States is placed at 13,912,000 qr. this year, or an increase of 26·1 per cent. compared with last year, when it amounted to 11,032,000 qr. *Barley*.—The production in Spain, Great Britain, Italy, Luxemburg, Switzerland, Canada, United States, Japan, Egypt, and Tunis is estimated to amount to 64,395,000 qr. in 1918, against 62,369,000 qr. in 1917, or an increase of 3·2 per cent. *Oats*.—It is estimated that the total yield in Spain, Great Britain, Italy, Luxemburg, Switzerland, Canada, United States, and Tunis will amount to 230,558,000 qr. in 1918, against 230,860,000 qr. in 1917, or a decrease of 0·1 per cent. *Maize*.—The production in Spain, Switzerland, Canada, and United States is estimated at 315,717,000 qr. this year, against 372,861,000 qr. last year, or a decrease of 15·3 per cent.

Sweden.—According to the official report for September the condition of crops was as follows, the corresponding figures for August, 1918, and for September, 1917, being given in brackets: (5=very good; 4=good; 3=average; 2=small):—Wheat, 3·0 (3·0 and 2·3); barley, 2·9 (3·0 and 2·8); oats, 2·8 (3·0 and 2·8); mixed corn, 2·9 (3·1 and 2·5); rye, 3·0 (3·0 and 2·0); hay, 2·1 (2·1 and 2·3); potatoes, 3·0 (3·3 and 3·7). The deterioration of some of these crops is attributed to heavy rains during September and the first half of October. (*The London Grain, Seed and Oil Reporter*, 1st November, 1918.)

Italy.—According to the latest official report the areas sown and yields of grain crops are given as follows, figures for last year and the average for five years, 1912-16, being given in brackets:—Wheat, 22,040,000 (17,196,000 and 22,124,000) qr. from 10,793,900 (10,432,100 and 11,764,600) acres; barley, 1,102,000 (886,000 and 1,129,500) qr. from 498,009 (466,800 and 605,100) acres; oats, 4,350,000 (3,504,000 and 3,221,000) qr. from 1,210,300 (1,090,500 and 1,189,300) acres; rye, 551,000 (505,000 and 588,000) qr. from 271,700 (270,950 and 290,470) acres. (*The London Grain, Seed and Oil Reporter*, 8th November, 1918.)

Spain.—According to the latest estimate, the acreages and yields of grain for this year are given as follows, figures for 1917 and the average for the five years, 1912-16, being given in brackets:—Wheat, 15,994,000 (17,830,000 and 15,740,000) qr. from 10,475,800 (10,335,770 and 9,820,720) acres; barley, 10,132,800 (9,352,100 and 8,893,600) qr. from 3,823,500 (4,003,900 and 3,638,100) acres; oats, 3,256,000 (3,478,000 and 3,130,000) qr. from 1,422,700 (1,398,000 and 1,346,100) acres; rye, 3,714,000 (2,823,000 and 2,930,000) qr. from 1,542,200 (1,803,800 and 1,882,100) acres; maize, 3,100,700 (3,425,000 and

3,225,000) qr. from 1,118,900 (1,175,700 and 1,138,600) acres. (*The London Grain, Seed and Oil Reporter*, 8th November, 1918.)

Canada.—According to the latest official estimate the yield of this year's wheat crop is given at 210,315,000 bush. against 233,742,850 bush. last year. The yield of oats is estimated at 457,000,000 bush. against 403,009,800 bush. last year, and the yield of linseed at 8,000,000 bush. against 5,934,000 bush. last year. (*The London Grain, Seed and Oil Reporter*, 5th November, 1918.)

India.—According to the final general memorandum on the wheat crop of 1917-18, issued by the Department of Statistics on 12th August, the total area under wheat is 35,497,000 acres as against 32,940,000 acres last year, or an increase of 8 per cent.; and the total yield is estimated at 10,174,000 tons (47,479,000 qr.) as against 10,234,000 tons (47,759,000 qr.) last year, or a decrease of 0.6 per cent. As compared with the average of the preceding five years, this year's yield shows an increase of 6 per cent.

United States.—According to the report issued by the Bureau of Statistics of the Board of Agriculture, the preliminary estimate of this year's maize crop is given at 2,749,000,000 bush., or an average yield for the whole country of 24.2 bush. per acre, against a total crop last year of 3,159,494,000 bush., and an average yield of 26.4 bush. per acre. The average for the last ten years was 25.6 bush. The crop of linseed is estimated at 15,000,000 bush., or 7.4 bush., a total crop last year of 8,473,000 bush. and an average of 4.7 bush. per acre. The weight of wheat is given at 58.8 lb., barley, 46.9 lb., and oats, 33.2 lb. per bush. against 58.5 lb., 46.6 lb. and 33.4 lb., respectively, last year. (*The London Grain, Seed and Oil Reporter*, 8th November, 1918.)

Argentina.—According to a report issued by the Statistical Department of the Ministry of Agriculture on 16th October, the areas of grain sown this season (1918-19) are as follows:—(figures in brackets are for 1917-18):—Wheat, 16,970,000 (17,576,000) acres; oats, 2,078,000 (2,854,000) acres; linseed, 3,418,000 (3,310,000) acres. As compared with the previous season (1916-17) there is an increase in every case. (*The London Grain, Seed and Oil Reporter*, 17th October, 1918.)

Australia.—According to the final figures available, the total wheat harvest for 1917-18 is 121,772,385 bush., as against 152,420,189 bush. last year. (*Broomhall's Corn Trade News*, 12th October, 1918.)

Japan.—According to a consular report, dated Yokohama, 18th July, the official forecast of the Department of Agriculture and Commerce gives the probable yields of corn crops as follows:—Wheat, 30,607,360 bush., or some 3,300,000 bush. below a normal year; barley, 39,930,880 bush., or 5,600,000 bush. below normal; rye, 39,178,240 bush., or about 1,500,000 bush. below normal. Last year's crops were in each case considerably above normal. (*The London Grain, Seed and Oil Reporter*, 14th October, 1918.)

Mesopotamia.—According to an official announcement the harvest recently gathered under Army superintendence and assistance has realised 475,000 tons of grain. *Broomhall's Corn Trade News*, 4th November, 1918.)

THE reports furnished by the Crop Reporters of the Board on agricultural conditions in England and Wales indicate that during October

**Agricultural
Conditions in
England and Wales
on 1st November.**

the remainder of the corn crops were practically all secured, with a few exceptions in hilly districts, throughout the country. The late corn, especially barley and oats, suffered a good deal from the prolonged wet weather, much of it had sprouted, and generally the condition of such corn is only moderate. Most of the wheat had been got in earlier in satisfactory condition.

Potato lifting had been a good deal delayed by the wet weather and the late corn harvest, but good progress was being made towards the end of the month. There appears to be rather more disease in the south than was anticipated, but elsewhere such reports are few, and the quality generally is satisfactory. Very variable progress has been made with mangold-pulling : in some areas half this work has been done, in others it is only just commencing. Very few turnips and swedes have yet been lifted. The quality of the roots is reported to be good generally.

Autumn cultivation was much hindered during the first part of the month, but the more satisfactory conditions of the last week or two allowed of more progress being made. The sowing of wheat and other winter crops was generally well in hand by the end of the month, and in a few districts almost completed, but in many parts this work is backward. In some counties the plant is beginning to show above ground, and in such cases looks quite well.

Seeds are variable : on the whole they may be regarded as satisfactory, but there are many poor or patchy fields in most districts. In the west and north some damage has been done by the stooks standing too long in the field.

The weather has not favoured live stock, which have only done fairly well ; and the grass in the pastures, although generally plentiful, is of poor quality. Prospects for winter keep are, on the whole, only fair, though there will probably be ample straw.

The supply of labour is generally deficient, but farmers have been able to cope with the necessary work.

The following local summaries give further details regarding agricultural conditions in the different districts of England and Wales :—

Northumberland, Durham, Cumberland, and Westmorland.—The supply of labour is deficient, especially for potato-lifting and thatching stacks.

Agricultural Labour *Lancashire and Cheshire.*—Labour is generally short, but women and children are giving much help in potato-picking, and assistance is obtained from soldiers and German prisoners.

Yorkshire.—Skilled labourers are scarce, but, on the whole, the supply has met the need.

Shropshire and Stafford.—The supply of labour is still short, but help has been given by women, children, soldiers, and prisoners of war.

Derby, Nottingham, Leicester, and Rutland.—The supply of labour is deficient.

Lincoln and Norfolk.—Labour is still very deficient.

Suffolk, Cambridge, and Huntingdon.—There is little change in the labour situation, the supply being below requirements as a rule.

Bedford, Northampton, and Warwick.—On the whole there is sufficient labour, though in some districts rather more could be usefully employed on potato lifting.

Buckingham, Oxford, and Berkshire.—Labour has been sufficient for the need.

Worcester, Hereford, and Gloucester.—The supply of labour is short on the whole, but there is some improvement in several districts, and with the aid of women, children, soldiers, and prisoners of war, the necessary work is being met.

Cornwall, Devon, and Somerset.—The supply of labour is still short, especially skilled hands, but women, children, soldiers, and prisoners of war have been of great assistance in potato-lifting.

Dorset, Wiltshire, and Hampshire.—The supply of labour is short, particularly skilled men, but with assistance farmers have been able to cope with the work.

Surrey, Kent, and Sussex.—The supply of labour is short, but the indispensable work has been done with such outside assistance as could be obtained.

Essex, Hertford, and Middlesex.—The supply is variable, but usually about sufficient to meet the needs. When no casual labour is obtainable, full advantage cannot be taken of fine days.

North Wales.—Labour is, on the whole, fairly satisfactory, and sufficient for the present need.

Mid Wales.—The deficiency in the supply of labour is rather keenly felt in some places, but in others, with temporary assistance, there is about sufficient labour to meet the needs.

South Wales.—Labour is still deficient, especially for skilled work.

THE JOURNAL OF THE BOARD OF AGRICULTURE

Vol. XXV. No. 9.

DECEMBER, 1918.

EDITORIAL NOTES.

AMONG the various factors which will take a part in the so-called reconstruction of rural Britain, one which is now receiving great attention at the hands of farmers is co-operative organisation, in relation to which a good deal of propaganda work has recently been done.

Agricultural Organisation.

Many forms of small "Societies" and "Clubs" have long existed in different parts of the country, and many have locally proved very successful, as the different articles on co-operative insurance societies which have from time to time appeared in this *Journal* have abundantly shown. Some of the co-operative societies have grown into bodies having a well-developed organisation and doing a large business, such as the Preston and District Farmers' Trading Society, Ltd., referred to at page 1098, in which it is stated that farmers have invested over £40,000 of capital, that the membership has risen from 208 in 1911 to nearly 1,000 last year, that the last returns show sales of upwards of £360,000 per annum, and that the society now has mills or depots at 13 centres. Further, a great network of co-operative societies, both large and small, is spread throughout England and Wales, and the societies affiliated to the Agricultural Organisation Society now have an annual turnover of £8,000,000 and a membership of 130,000. Grants to the A. O. S. (see page 1058) have been made to enable it to organise new societies and extend and improve existing ones.

Something above and beyond all these societies is needed, however, and the aim of the professed leaders of agricultural co-operative organisation would appear to be to bring the whole agricultural industry under one great organisation managed on a business basis. The objects of such a farmers' organisation would be to reduce the cost of production; to buy wholesale the best fertilisers, machinery, etc., at the lowest

price ; to sell on the soundest lines at the minimum cost ; to reduce the number of superfluous middlemen ; to guarantee quality of purchased goods (*e.g.*, fertilisers) ; to ensure just treatment of farmers by the nation ; and to enable farmers to produce, as stated by Mr. Leslie Scott, " the amount of food the nation wants, of the kind it wants, at the price it wants."

As to the desirability of such an organisation the promoters have not a doubt, but as to whether it shall become a vital part of British agricultural life farmers themselves must decide. The facts put forward in the several articles in this issue of the *Journal* should enable farmers to conclude that the advantages of co-operative organisation are genuine and considerable, and that it will be to the benefit both of themselves and their neighbours if they join the movement.

* * * * *

Most farmers will probably remember the days when the first motor cars could not run from London to Brighton (about 50 miles) in 12 hours. The distance can

Farm Tractors. well be done now by motor more quickly than by the fastest express train. So recently as five years ago doubts were freely expressed whether the farm tractor was of any value other than for purposes of simple road haulage, and, perhaps, the driving of the smaller forms of stationary machinery. These doubts are being gradually swept away, and the magnificent work which has been done by tractors during the past two years must have gone far to convince farmers that there is a great future before them in regard to farm tractor work—ploughing, cultivating, rolling, reaping, binding, thrashing, timber cutting, etc. Much remains to be done in improving existing tractors, but there has already been marked progress since the outbreak of war. The official tractor scheme is declared (see the article at page 1045) to have fulfilled its object, to have enabled the county committees " in every instance to carry out their programmes for increased corn production " and to have " assisted them to reap their harvest." Some of the work done, indeed, has been remarkable, whether it be examined from the point of view of speed or of efficiency—and it has been done, and the land has been sown, when horse labour could not have succeeded in producing a seed-bed. Captain Hutchinson's article, epitomising the experience of the Food Production Department, will be read with great interest by farmers, who will do well to watch closely the case for farm tractors—for, if an " emergency scheme " run under great difficulties

during the stress of war could secure the results it has done, it seems quite certain that under ordinary conditions and in private hands the farm-tractor will save labour and prove an effective method of cultivation.

* * * * *

HORTICULTURISTS will read with pleasure the reference at p. 1110 to the inauguration of a Chamber of Horticulture, which

**A Chamber
of Horticulture.**

should go far to secure greatly increased attention to all questions relative to the cultivation of vegetables, fruit and flowers.

There might well be in the future a wider knowledge of the simplest means of raising the more readily grown flowers which beautify our gardens and serve to stimulate in such great measure the harmonious activities for which gardeners are justly famous. At the moment, however, the more practical questions for consideration relate to the stemming of food shortage, having in view the greatly increased production of fruit and vegetables. Whereas the cultivation of vegetables is still very poorly conducted by the rank and file of growers as compared with the best, there is still greater difference between owners of fruit trees. Unfortunately, the grower does not sufficiently recognise the importance of pruning, spraying, variety in reference to cross-fertilisation, manuring, storing, and so forth. The farmer's orchard, also, is too often very much neglected in these respects, and his fruit yields might often readily be doubled. The Chamber of Horticulture is specially designed to aid in increasing the produce from market growers' orchards. These are usually better managed than the gardens of private persons, since their business is wholly involved, but even extensive fruit plantations might well be improved. A badly-managed orchard is a danger to orchards which neighbour it. The new Chamber of Horticulture, therefore, will find plenty to do in stimulating increased production, in indicating the results of better methods, and in forwarding educational and research work.

* * * * *

THE winter months are hardly propitious for the purpose of cheese-making, but they offer a convenient time during which

the advantages of cheese-making may be considered and arrangements may be

Cheese Schools. made to start work next spring. Articles dealing with the question have already been published in this *Journal** and,

* See articles in this *Journal*, May, 1917, p. 170, "The Manufacture of Cheese in Co-operative Dairies," and June, 1918, p. 322, "The Services of the Co-operative Cheese Schools in the Formation of Milk Depots."

in view of the importance of both knowledge and co-operation, notes on the working of co-operative cheese schools appear in the present issue (pp. 1087, 1091). This report affords instructive reading, and shows that by co-operating, the milk suppliers received several direct benefits. Farmers in any given district might very usefully consider whether they might not start a co-operative cheese factory, and if so, whether they might not first take advantage of the benefits to be secured, as at Marlston, near Newbury, by arranging for the organisation next season of a co-operative cheese school. Should such a cheese school be desired the Board would be happy to make the arrangements in co-operation with the local authority.

* * * * *

MANY farmers are fully acquainted with the value of basic slag for improving grass land, particularly on heavy soils, but there are, nevertheless, large numbers who do not make sufficiently extensive use of this phosphatic manure. It is no exaggeration to say that on some heavy land pastures the results of slagging have been marvellous—so good, indeed, that some very practical men have needed to see the improvement before they could accept the stated facts. Where grass was poor and thin, and clover was for all practical purposes absent, a dressing of basic slag in autumn has shown where it has been put on by the following summer, and treble so the year after, clover coming well and strong and the grasses improving as the clover has developed. The classic experiments at Cockle Park* and the results obtained by Professor Somerville at Poverty Bottom† are well known cases in which basic slag has proved its worth; the former are referred to at p. 1102 of this issue of the *Journal*. Where basic slag has not previously been used the farmer should consider carefully whether he might not now employ it with advantage and perhaps consult the county agricultural organiser in doing so.

GOVERNMENT TRACTOR CULTIVATION IN ENGLAND AND WALES.

CAPTAIN G. T. HUTCHINSON,

*Mechanical Cultivations Commissioner, Food Production
Department.*

In order to appreciate properly the part played in British agriculture to-day by the tractor, and its possibilities in the future, it is essential to consider briefly the history of the tractors operated by the Food Production Department—the so-called Government Tractor Scheme. Without this information misleading conclusions might be formed, and full value could not be obtained from the lessons taught by the Government tractor.

Inauguration of the Scheme.—The scheme was instituted at a moment when, in consequence of submarine warfare, it became necessary to grow as much corn as possible, and to grow it against time, in the British Isles. To carry this policy into effect throughout the country, some increased and more rapid means of cultivation than those hitherto in practice were demanded. Even if sufficient horses had been available, their work was too slow for the emergency; further, every team of horses required a man, and sufficient men could not be found. Nor could increased steam tackle meet the difficulty, for additional sets could not be procured quickly, and corn could be grown in many parts of the country where the geographical conditions made the use of steam tackle impossible. The Government, therefore, resorted to the tractor, which could operate in districts where steam tackle could not, and which required less labour and covered more ground than horses.

The Scheme Itself.—In these circumstances, little use could be made of the experience gained with the few privately-owned tractors in the country. It was considered necessary to purchase tractors of all types, wherever they could be found, to set them to work at once, and to deal with the question of suitable types and the renewal of worn parts as soon as the situation should permit. A beginning was made late in the spring of 1917, and the scheme was rapidly developed. In order to utilise the tractors to the fullest extent possible some system of centralised control had to be improvised, and at the same time local arrangements had to be made for working them, and keeping them in repair. These facilities were sup-

plied by the mechanics and repairing shops of the motor trade, which was, in effect, entrusted with the local management, under the control of the Food Production Department. Tractors were received by each county as they became available; the Tractor Representative for the county, acting in concert with the Agricultural Executive Committee, arranged their work; they were manned mainly by soldiers from the Agricultural Companies; and they were kept running by the proprietors of the provincial motor garages.

Their task was to plough land at all costs, and the initial difficulty was to overcome the reluctance of the farmer to employ an untried and suspected means of cultivation. They could not wait for suitable weather or suitable land; the position was like that of a new business, where orders must be canvassed for, unremunerative contracts accepted, and a supply created, in the hope that it will create a demand. Such was the preparation by the Government tractors for the 1918 harvest. After the completion of the spring cultivation, it became possible to place the scheme upon a more workable basis. At one time, more than 20 types of tractors were employed by the Government, and the inconvenience and frequent impossibility of providing spare parts and repairs for each type constituted a serious handicap. Within the past few months it has been possible to reduce the types to 6, and to ensure the supply of spare parts, so far as war conditions permit. It has also been possible to decentralise the scheme, and to hand over to each county committee the control of the tractors allotted to it. In several counties a further advance has been made by loaning the tractors to individual firms to operate as a private enterprise, subject to such control as the county committees consider necessary. Experience has shown that with tractor ploughing, as with other forms of business, better results are obtained by private enterprise than by Government employees. It has also been possible to release tractors for sale to individual farmers, and since the beginning of this year some 3,000 to 4,000 tractors have been disposed of in this way.

Results of the Scheme.—To summarise briefly the results of the scheme, it may be said that it has fulfilled its object. It enabled county committees in every instance to carry out their programmes for increased corn production; it assisted them to reap their harvest; and it has introduced a new and highly efficacious means of cultivation to the farmers.

To form a proper estimate of the capabilities of this instrument, however, a careful distinction must be drawn between the tractor of the Government scheme and the tractor in the hands of the farmer. The former was employed as an emergency measure ; in consequence its work was often imperfect, labour was wasted in connection with it, and operating expenses were high. In the hands of the farmer, on the other hand, the tractor economises labour and does the work cheaply. It would be most unfortunate if agriculturists should be tempted to base their opinion of the merits of the tractor solely on their experience of the tractor scheme.

Difference between the Government and Private Tractors.—The points of difference may be conveniently grouped under five headings.

(1) *Working Expenses.*—The first of these points concerns working expenses. The exigencies of the situation required that the Government tractors should be available wherever they were required. They were, therefore, grouped in units of (in most cases) 10 tractors, each unit serving a wide district. Steam tackle working under similar conditions would move from farm to farm as a self-sufficient unit, complete with plough, cultivator, and cabin for the crew ; the farmer would have fuel and water ready in the field. The tractor, however, cannot haul its own fuel supply, and, under war conditions, the farmer cannot provide it. Petrol, paraffin, and grease must be delivered daily in a light motor van : this method is expensive, but delivery by horse transport would be too slow, and a motor lorry could not reach the inaccessible fields in which so many of the tractors are employed.

In cases of mechanical trouble, a mechanic must be summoned from the headquarters of the unit to effect the necessary repairs. From time to time a supervisor of some sort must also visit the tractor, to see that the men are working, and that the ploughing is satisfactory. With the privately-owned tractors these officials disappear ; the farmer keeps the fuel in his coachhouse, supervises the work himself, and avoids the necessity of frequent repairs by taking care of his tractor. If bad weather stops the work, he can find another job for the driver, but the drivers for the 4,000 Government tractors, scattered in billets all over the various counties, often spend an idle day.

(2) *Repairs.*—The second point to be considered is the question of repairs. Most of the tractors operated by the Govern-

ment were built in America, where paraffin as a fuel is little used. The engine is designed to burn petrol or petrol substitutes, which are drawn off from the crude oil because of their volatility. Paraffin is a by-product of these oils and is not actually a volatile fuel oil. It has to be made so by means of an atomiser and superheaters, before being introduced into the combustion chamber. Time and experience are now meeting the difficulty, but last spring the work of the Food Production Department could not be delayed. Petrol could not be spared, but paraffin was available. Tractors were hastily adapted and worked with paraffin, and in some cases this has resulted in excessive wear of engine parts and consequent engine trouble. Competent mechanics have not always been obtainable when required, and the supply of spare parts, in wartime, in sufficient numbers for the Government tractors, has been a perpetual difficulty. The critic who concludes that the tractor is no good, because he has seen one standing idle for weeks in the field, should enquire whether it is in fact waiting for a spare part which lies at the bottom of the Atlantic! The peace-time tractor will not suffer from this handicap.

(3) *Nature of the Work.*—A third point to consider is the difference in the nature of the work which the Government tractor and the farmer's tractor are required to perform. For various causes, which it is unnecessary to discuss here, in nearly every part of England some very unsuitable grass land has been ploughed up within the past twelve months, and the most unsuitable has usually been allotted to the Government tractors. Much of this work has not been ploughing, but reclamation. The Government tractors carried out some astonishing performances last spring. They dug themselves deep into the Midland clay, they broke implements innumerable on the concealed rocks and boulders of the west country, and they skidded vainly about the hillsides of Wales and the North. Fatal accidents were not unknown, but land was ploughed—at a cost—and crops were grown: it was "magnificent, but not agriculture." No doubt this reclamation work has already justified itself, and the average farmer will not purchase a tractor to reclaim land, but to plough.

Government tractors were also operated in typical grass counties in the Midlands and in the West, where each farmer had sacrificed one field to the good cause. Here the fields themselves might be suitable, but the amount of roadwork involved in going from farm to farm, with consequent high fuel

consumption and wear and tear to the tractor, made economic working impossible. This difficulty will not apply to the farmer's tractor.

(4) *Labour*.—A fourth point of difference is labour. At the end of the spring cultivations in 1917 the Food Production Department was operating about 600 tractors; at the same period in 1918 it had over 4,000. Drivers had to be found and trained from such material as the exigencies of war left at the disposal of the Department. When the Government tractors are disposed of, these men will be available for the farmers, and already measures are being taken to assist the training of drivers for privately-owned tractors. The farmer will at least be able to select a suitable man to train for his tractor, but the Food Production Department was never in a position to pick and choose. A most encouraging feature is the excellent results so frequently achieved by the hastily-trained Government drivers, and the satisfaction which women drivers have given in so many counties.

(5) *The Implements Used*.—Another advantage which the farmer's tractor will have over the Government tractors is that the farmer will be able to attach it to the plough or cultivator which is most suitable for his particular requirements, whereas the Government tractor is limited to such implements as are now available. In nearly every part of the country the experience of generations has evolved a special plough, cultivator, or harrow, to deal with local peculiarities of soil or cultivation, many of which are manufactured locally. In war-time the output of such implements is limited, and if all are commandeered by the Government, the demands of private purchasers cannot be met. It has, therefore, been necessary to purchase implements in bulk for use with the Government tractors, largely in America, in order to carry out Government cultivation without unduly curtailing the supply available for individual farmers. It is, however, unreasonable to expect that their work should be equally satisfactory in all localities. One type of Oliver plough made to turn a wide furrow has proved unsatisfactory on hard ground, until converted to turn a narrower furrow. In some counties a heavier cultivator than those cultivators now obtainable is demanded. In these cases it is manifestly unfair to condemn the tractor because the right cultivator's implement is not obtainable, and the work has suffered in consequence.

Possibilities of Tractor Cultivation.—It remains to consider what profitable conclusions can be drawn from the experience

of the Government tractor scheme as to the possibilities of tractor cultivation in England.

In the first place it is established that to obtain the best economic results from the tractor, it should be in the hands of the farmer, and should not leave his farm, except perhaps to assist his immediate neighbours, in cases where such an arrangement is possible. Though there is no doubt that tractor ploughing firms will be started, to carry out work on the same lines as the existing steam ploughing firms, the difficulties of fuel supply, roadwork, and supervision, must always place this system at a disadvantage, when compared with the privately-owned tractor.

Work Done.—Sufficient has already been said to indicate that the acreage results achieved by the Government tractor must not be accepted by prospective purchasers as a final test of their capabilities. The statement of weekly averages in the counties, circulated by the Department, shows that few counties are able to maintain an average of 10 acres ploughing per week per tractor in commission, or a fuel consumption below 5 gal. per acre. In nearly every county, however, a Fordson tractor, with a self-lift plough, has ploughed over 5 acres in the day under favourable conditions, in the hands of one reasonably competent man or woman. The same tractors have frequently cut upwards of 15 acres in the day with a binder, which would not be exceeded by two teams of three horses working in two shifts. The fuel consumption of the farmer's tractor should be in the region of 3 gal. per acre ploughed.

Quality of Work.—It has also been proved in every county that the quality of the work done by tractors can be perfectly satisfactory. It serves no useful purpose to compare their work with that of horses or steam tackle, because all three will be required; it must depend on circumstances in each case which method can be, or should be, adopted. Plenty of bad work has been done by the tractors, the reasons for which have been fully explained. The best testimony in their favour is the verdict of the farmer, and whereas a year ago it was necessary to canvass for orders for work for the limited number of tractors available, to-day, in practically every county, the tractors are scarcely able to carry out the daily increasing number of contracts for ploughing.

Quick Work.—It is now realised that the tractor enables the farmer to cultivate at the right time, and the importance of

this is appreciated by every practical farmer. Theoretically, if a man has the requisite "strength" for his farm, he should be able to keep it employed throughout the greater part of the year, and to carry out the successive operations of husbandry, each in its proper course. In practice, climatic conditions make this impossible. One operation is delayed by the weather and subsequent operations suffer.

The broad distinction between the bad and the good farmer is that the former is usually in arrears and the latter beforehand with his work, because he has a reserve of "strength" to meet these emergencies. The tractor provides a reserve of cultivating strength which eats nothing and costs nothing when it is not employed. For example, during the past summer many farmers were able to employ all their horses for leading their earliest corn crops, while the later ones were being cut with tractor and binder, and by this means to complete their harvest before the weather broke. The same men could then plough their stubble with the tractor while their horses were still leading the later corn crops. Their neighbours, without this additional "strength," have had corn spoilt and have afterwards had to spend idle weeks waiting to plough their sodden stubbles. There is always a certain period of the year when the soil is in the proper state for ploughing; it is then possible to plough better and deeper, leaving the ground in good condition for subsequent cultivation, and for preparation of the seed bed which will give the best yield. If this opportunity is lost because the normal strength of the farm is otherwise employed, it cannot easily be recovered—on heavier soils it may mean a year's delay—but with the tractor it need not be lost. It is a notable fact that in some counties, in spite of the wet autumn, work on the farms is actually more advanced to-day than it was at this time last year—thanks to the tractor.

Types of Tractors.*—It is often asked, which is the best sort of tractor to buy? The Food Production Department have employed more than 20 different types, all of which have had their good and bad points. Six types have now been retained, but it must be remembered that, in eliminating, the possibility of ensuring an adequate supply of spare parts for the types retained was an important consideration. Of these, the "*Titan*" has done excellent work under the most variable conditions. It has ploughed on the Devonshire hillsides and in the holding clays of the Midlands, and it has been used as a stationary engine to thresh, to cut chaff, or work a saw. The

* A note in this *Journal*, January, 1918, p. 1164, might also be consulted.

main improvements which have been made in some cases are a better fore-carriage, and special spuds on the wheels to hold on slippery ground.

Another "general utility" tractor is the "*Overtime*," and many of these tractors have now been in the hands of private owners for upwards of a year, and have given satisfaction.

The "*Clayton Shuttleworth*" is a powerful and more expensive tractor, which has been found specially suitable on heavy clay land, as the pressure on the land is considerably reduced by a "caterpillar" track. It is the only tractor of this type now operated by the Department.

The "*Saunderson*" is another British-made tractor, which has the advantage of a winding drum, and has therefore been in request for threshing, as the drum enables it to haul a threshing box up a steep pitch in a country lane. It has been found more satisfactory than other tractors for roadwork.

The "*25 H.P. Mogul*" is a heavy tractor, employed mainly for threshing, but in some counties it has done a lot of work with the plough, while the land was in a suitable condition. It is too heavy for use on wet land.

The "*Fordson*" tractor is probably the cheapest tractor on the market, and, if its limitations are recognised, it is the best labour-saving device which the farmer can obtain. It is the only Government tractor equipped with a self-lift plough, and can, therefore, be worked by one man. It is not yet a "general utility" tractor, as it may prove to be too light to be used effectively as a stationary engine, but for the purpose of cultivating it is an acknowledged success. It is often said that it is unsuitable for heavy land, but its success in Essex and other heavy-land counties has led its adherents to believe that, when heavy land is in the proper condition for ploughing, the Fordson can plough it, and when it is not, it is best to leave it alone. No less than 2,500 of these tractors have already been purchased by private owners, a fact which indicates the farmer's opinion of its merits. For some time its reputation suffered because the No. 7 Oliver plough turned a 14-in. furrow, which in many cases proved unsatisfactory. This plough has now been converted to turn a 10-in. furrow, with the best results, and two other types of Oliver plough, one of them specially adapted for ley-ploughing, will shortly be on their trial in the counties. Other improvements now being carried out by the Department are the provision of a "governor" for the engine, a brake for roadwork, and a "release" attached to the draw-bar, to prevent accidents in case of the tractor rearing

FIG. 7.—A Titan Tractor with Plough and Land Presser.

up. In some cases, too, it has been found necessary to alter the strakes on the wheels, in order to gain a better hold on slippery ground.

How to Select a Tractor.—Unquestionably the proper course for a prospective purchaser to adopt is to examine the work of his neighbour's tractor, or of the different types of Government tractors in his county, before making his selection. He should have no difficulty in obtaining full information from the officials employed by the Executive Committee of his county, and by this means he can see and judge for himself which type is best suited to his particular requirements. He should also remember that the implement is just as important as the tractor, and can form his own opinion of the former by examining the various makes now utilised by the executive committees. For example, the work of the disc cultivator, and of other new implements, may be inspected with advantage. It may be added that, though tractors will undoubtedly be improved, it is better policy under present circumstances to purchase one of the reliable tractors now available than to wait for a perfect type. It is vain to hope for a tractor which will be equally good for cultivation and road haulage. Presumably the motor lorry represents the best type of internal combustion engine for road work, and it is impossible to imagine any form of motor lorry which could be utilised with a plough.

If British agriculture is to derive full advantage from the experience of the Food Production Department, much can be done by the executive committees of the counties. These committees have recognised that the Government tractors must work primarily for those farmers who could not cultivate under present circumstances without assistance, and that applications for tractor ploughing received from farmers who should be in a position to cultivate for themselves must be deferred. The latter should purchase their own tractors or more horses. It is to be hoped that the time is not far distant when all farmers will be in a position to dispense with Government cultivation. Meanwhile, committees can place at the disposal of the farmers the experience gained with the different types of tractors and implements employed in their county.

The writer of these notes has prepared them after seeing something of the work of the Government tractors in practically every county in England and Wales, and after discussing the difficulties encountered and the results achieved, with those who have operated the tractors since the inception of the scheme. Any points which may be described as technical have been

carefully verified by the experts employed by the Food Production Department. Though criticism of the tractor scheme is by no means unknown, there are no two opinions as to the value of the work of the tractors, and it only rests with the farmer to take advantage of what is probably the widest form of practical demonstration ever carried out by an Agricultural Department.

THE DEVELOPMENT OF AGRICULTURAL ORGANISATION.

Sir R. HENRY REW, K.C.B.,

Assistant Secretary, Board of Agriculture and Fisheries.

THE advantages which farmers would gain by combination for their mutual interests have long been recognised in theory, but very imperfectly realised in practice. For certain purposes, indeed, farmers have long shown some readiness to combine. There are hundreds of societies and clubs throughout the country, many of them of considerable antiquity, which exist mainly for the improvement of farm stock. No doubt many of them are largely supported by landowners and others interested in agriculture, but they nevertheless include a large proportion of tenant farmers, who have associated themselves together for practical objects. Combination of farmers for their general interests as a class has also had partial success, as in the Central Chamber of Agriculture and the Farmers' Union. But it, nevertheless, remains true that farmers are reluctant to combine, and that if for a time they are induced to do so they are apt very quickly to fall away. Under the influence of persuasive eloquence, or the stimulus of some political grievance, they may join an association, but when the second or third subscription falls due they begin to ask what they are getting for their money—a question to which a very definite answer is not always immediately obvious. Altruism is not a characteristic virtue of any class of Englishmen, and it is perhaps especially inconspicuous among farmers. The British farmer is a very practical person, with a strong tendency to individualism, and a rooted objection to unremunerative outlay.

It is now about a quarter of a century since, after some experience of agricultural organisation in different phases,

I became convinced that a national association of farmers on a scale commensurate with their numbers as a class, and their importance in the country, was only feasible if direct commercial objects could be combined with the more indirect political and economic objects, to which attempts at establishing such associations had generally been restricted. The really powerful class organisations in this country are those which offer pecuniary advantages to their members, as well as the more impersonal benefits to be attained by joint action in the interests of their class. I used such influence as I then had with the Chambers of Agriculture to induce them to take up the question from this point of view. Two committees explored the subject in considerable detail, and the report which was presented in 1898 on Co-operation for the Sale of Agricultural Produce attempted to sum up the position as it then appeared, and recommended the establishment of a "Co-operation Section" of the Central Chamber of Agriculture. That proposal was supported by many of those who at that time were among the more far-sighted leaders of agricultural opinion, and, if it had been possible to develop it, the initial difficulty of enlisting the aid of the larger farmers in promoting the principles of agricultural co-operation might possibly have been overcome, and the whole movement might, perhaps, have been accelerated. The organisation of the Chambers of Agriculture then, as now, comprised a large number of local bodies, which varied a good deal in the scope of their operations, and some of them, at that time, had adopted the principle of co-operation in one form or another—usually for the purchase of farming requisites. It appeared that by the process of building up on existing foundations the adoption of the principle might be gradually extended throughout the country, with the assistance and support of those who were recognised as the leaders of the agricultural community. There were obvious objections and difficulties attaching to this mode of procedure, and it may be that the establishment of a new and independent association was the better course. A year or two after, the late Sir R. Yerburgh, who was a member of the Committee of the Chamber of Agriculture, and approved its report, established the Agricultural Organisation Society, which has now become a powerful and widespread association. The position which it has now attained, and the work it is doing, are indicated by Mr. Leslie Scott and Mr. Acland in the papers which appear in this number of the *Journal*. It may be noted that the initial difficulty referred to above still remains, although, thanks

largely to Mr. Scott's own energy and enthusiasm, the interest and assistance of the larger farmers are now being rapidly enlisted in the movement.

In numbers, what may be termed large farmers are more limited than is sometimes realised. There are 51,767 holdings of more than 150 acres in England and Wales, of which no more than 14,126 exceed 300 acres. But the influence of these farmers is not to be measured by their numbers. Each of them is in a large degree an example which those who occupy smaller farms attempt to imitate, for the tendency of even the small holder to copy the methods and practice of the larger farmers in the district—sometimes quite unsuitably and unwisely—has often been remarked. No doubt it is difficult to bring the large farmer and the small holder on to the same commercial plane, but the problem, though difficult, is not insoluble, and if farmers themselves assist there is good reason to believe that the Agricultural Organisation Society can, and will, solve it.

The principles stated in the report to which reference has already been made, are generally accepted. While co-operative purchase of farming requisites is easy, co-operation for the sale of produce is very difficult. The advantage of associations of producers in particular districts, for the joint disposal of certain classes of produce, is particularly marked in the case of farm produce subjected to a process of manufacture, such as the conversion of milk into butter or cheese, the curing of bacon, or the making of jam. Co-operation for the sale of live stock and for the sale of milk had, twenty years and more ago, been undertaken with success. The tendency, both at home and abroad, for co-operative associations to be specialised—i.e., to confine their operations to a particular kind of produce, appears to continue, and probably affords the best, if not the only, means, in most cases, of getting the co-operative principle accepted in a district, leaving the linking up of specialised societies to a later stage of development.

It is a platitude that British agriculture, with the British nation, and indeed the whole world, is entering a new era, of which all that can at present be said, with certainty, is that the conditions will be different from any which have previously existed. Whatever the future may bring, however, it is clear that farmers will find combination not less necessary than before, and that in developing that form of it which is commonly known as co-operation, they will be wise in their day and generation.

AGRICULTURAL ORGANISATION, WITH PARTICULAR REFERENCE TO GUARANTEED MINIMUM PRICES.*

THE RT. HON. F. D. ACLAND, M.P.

My address has had to be put together hurriedly, mostly on railway journeys, because of the pressure of more important work. That work has largely been the getting in of my potatoes, and I am sure you will all agree with me that when this has to be done everything else is of less importance and has to be fitted in where it will go.

When I have thought of introducing the subject of Agricultural Organisation to this Club I have wondered where to begin. But as one of our wisest members said to me last week—What is this Agricultural Organisation? I must clearly begin at the beginning.

The Co-operative Movement.—Agricultural organisation, in the sense in which I shall speak of it, is a movement of co-operation of farmers, small holders, or allotment holders in societies registered under the Industrial and Provident Societies Acts, which now contain about 70,000 large and small farmers and about 100,000 allotment holders. There are about 450 farmers' societies of this kind now in existence, and about 550 allotment holders' societies, and their annual turnover is about £8,000,000. They vary in size from the Eastern Counties Farmers' Co-operative Association of 2,400 members whose holdings average over 250 acres, spread over several counties in East Anglia, with a turnover of over three-quarters of a million, to small village or suburban allotment societies, which exist, perhaps, merely for the sake of taking a piece of land in co-operation.

I must give some figures, but I will condense them. There are many sorts of societies, and in round figures they are grouped thus :—allotment societies 540, farmers' societies for purchase of requirements 250, eggs and poultry societies 70, fruit societies, co-operative auctions, etc. 60, dairying societies 50, credit societies 22. The first societies joined the movement in 1901, when we had 25. Taking this year and the four dates following 1905, 1910, 1915 and 1918, the numbers were, roughly,

* Address delivered to the Agricultural Club, 23rd October, 1918.

25, 125, 400, 550, 1,000 ; membership for the five dates 500, 7,500, 24,000, 55,000 and 155,000 ; turnover £10,000, £220,000, £1,100,000, £3,000,000 and £8,000,000.

The Agricultural Organisation Society.—The movement to which these societies are affiliated is called the Agricultural Organisation Society, or more usually the A.O.S. After much devoted pioneer work it was started in 1901, and for years it owed its progress and almost its existence to the late Sir Robert Yerburgh. For years it depended purely on the support of friends of co-operation, nearly all landowners. They put up about £2,000 a year to run it during the first eight difficult years, and have kept the voluntary subscriptions at about £1,500 a year since. Affiliation contributions from societies remained generally below £100 till 1912, and have only last year, with great difficulty, been squeezed up to £1,000.

The Small Holdings Fund began to help in 1909 and has given something near £2,000 a year since then. The Development Commissioners have given about £8,000 a year since 1912, and last year £15,000. This year's budget is for £24,000, and towards this sum the Development Commissioners give a block grant of £6,000 and pound for pound in voluntary contributions, and £4 for each £1 in affiliation fees from societies. There is also at present a special allotment grant of £10,000, mostly from the Food Production Department.*

For many years the movement was run mainly by an Executive who elected themselves, or one another, but during the past year it has been reorganised on an absolutely democratic basis. Fifteen branches have been set up covering all England and Wales. In each there is a branch committee responsible for organisation and propaganda, elected by the societies in the area on a basis which combines membership and turnover in a way which gives both the societies which are small in membership with a large trade, and those with large membership and small trade, a fair share of control. The branches are grouped into seven provinces for the election of governors on the same voting basis. Co-option of governors is reduced to a minimum. Each branch has a minimum staff of a branch secretary and an allotments organiser. The Society, besides being self-governing, is to become far more self-supporting. The affiliated societies are largely increasing their affiliation fees. Unless they do it, and with a will, the Government grant will, quite rightly, be withdrawn.

* See also this *Journal*, November, 1918, p. 994.

The principles of working the societies are very simple. Membership should be confined to actual cultivators of land. The capital should be provided by the members taking shares and paying up on them whatever proportion of their value is required. Liability is limited to the unpaid amount of the shares taken. The number of the shares that may be taken is unlimited, the interest that may be paid on them strictly limited. The profits, after this limited interest is paid, are distributed as a bonus on business done. Most societies do not aim at high bonuses but rather at buying cheaper or better, and giving better prices on sales than would otherwise have been obtained. Thus recently a society had 1,700 sacks of maize and the market price went up 10s. a sack. The society sold at the original price, giving members an advantage of between £7,000 and £8,000. Another society had 1,500 tons of decorticated cotton cake bought at £11 12s. 6d. a ton. The price went up to £15 15s., but the society sold at £11 15s., making only 2s. 6d. a ton towards profits, but saving the buyers £6,000. Similarly a decent society which buys cake will sell it again as cake within the fixed prices, and not grind it up into meal and sell it at double its value, as is done elsewhere.

Examples of Co-operative Societies.—Let me give some examples, taken almost at random, which will illustrate the sort of work a society can do.

The Auction Markets at West Bournemouth and Boscombe.—There are collecting depots for vegetables, etc., in nearly every village around Bournemouth. A motor lorry collects the produce of the small producer. On the following day it is put up in small household lots and sold by auction to Bournemouth householders. The produce is fresh, and the prices are less than shop prices, but the producer gets from 30 to 60 per cent. more than he would without the society. About £15,000 worth of produce is sold annually. Producer and consumer are brought together directly, by the work of the society, in a way that would not otherwise be possible.

Preston and District Farmers' Trading Society.—This is a society of small farmers, its object being to purchase pure feeding stuffs at reasonable prices. The society was started in 1903 under another name and languished till 1909. The sales went down from £800 to £300, and the profits from £14 to £5. But note the virtues of sticking to it. The society was moved to Preston and re-formed. Between 1911 and 1915 the membership rose from 200 to 550, the sales from £15,000 to £135,000.

Share and loan capital was subscribed up to an average of £30 per member. Mills were bought at Liverpool. The warehouse and offices are at Preston and there are eight branch depots. Grain is taken *ex-ship* to the mills, ground and sent direct to the depots and delivered in the society's waggons. No price lists are issued and often no prices are quoted. The traveller tells the farmer what the society can supply and what is the best value from time to time, and the farmer orders, knowing that it is in the society's interest to charge him the lowest price possible. Farmers' cheese and corn are bought and other steady developments are made owing to the farmers' willingness to put up capital. The success attained is due to the awakening of a real co-operative spirit by close organisation of a fairly limited area.

Urmston, near Manchester.—Here is a typical allotments society. It started in 1916 and took a field of 5 acres, let to tenants at £10s. for 350 square yards. Fencing was done by members in spare time, and a large central plot was left for experimental and charitable purposes. Next year the holding was five fields of 12 acres, cultivated by 190 holders. Tool-house, barrows, scales, sprayers, and seeds are bought co-operatively. A contract is made with a local co-operative society for all its stable manure. Artificials and seedlings are bought in bulk, and 7,000 jam jars are distributed. Wart and other disease is kept out of the potatoes, by buying immune varieties and spraying. Flowers have to be planted on the ends of the plots next the high road. Lectures are held, and a National War Savings Society is established. All is done on an income of £112, and an expenditure of £80. The special features here are the real keenness for genuine co-operation among the cultivators and the production of far more and far better produce at less price than would have been possible without the society.

Lastly, the *Wiltshire Farmers*.—About them I point out this only—membership was increased from 600 in 1916 to 1,200 in 1917, not by enlarging the area, but by careful organisation on the old ground. Of the 600 new members 120 were holders of 5 acres or less. The members produce milk, sending it to two depots, where it is cleaned, pasteurised and chilled. Result—none of their milk is ever lost as sour. Of the ordinary London supplies 2 per cent. are lost as sour in the summer, 1 per cent. in winter. This, on the basis of figures given in the Astor Committee Report,* means a loss on present prices

* See this *Journal*, July, 1918, p. 452.

of about £150,000 a year. The special feature of the co-operative method is that the public gets a regular standardised pure supply, *with no grading down to the statutory figure of butter fat*, and this it would not get without co-operation.

Possibilities of Co-operation.—So far I have simply tried to show that there is a movement which is doing something worth thought, study, help. The road which it has still to cover is, perhaps, even more worth thought and study, and to cover it still more do we want help from all persons of goodwill. There is much need. For years after the movement started it grew, but did not really strike its roots deep. It did not, for instance, gain the confidence of the big farmers. So the men who in the past year or two have been putting new life into it—amongst them first and foremost Mr. Leslie Scott—have much before them. For instance, in some great counties in England the movement hardly exists. Then the areas covered by societies must be delimited and each area worked intensively, for it ought to be thought bad form by farmers to take advantage of the existence of a society to bring down prices and secure closer competition from traders—and not to join it themselves. Again, societies have been content with little, they have just appointed a manager who was an expert buyer of supplies; they have taken no care to push the co-operative principle into all the corners of their life and industry. Again, there are spheres of work almost unexplored, promising good results alike to the farmer and to the community. For instance, we have only five co-operative slaughterhouses; we need 500—for good farmers will quite steadily come round to the dead-weight basis. Official schemes of providing credit in connection with societies are few; they should be increased. It should be an integral part of the work of societies to help in keeping their members' accounts and in determining their costs of production. Milk recording, the elimination of bad bulls, and the systematic inspection of dairy herds, should be a part of the work of all dairy societies; and we should handle far more milk than the present 150,000 gal. a day. Co-operative purchase and owning of implements, particularly tractors, has a great future, but is still in infancy. The system of control in the sense of the Irish Creamery Butter Control should be grafted into our producing societies. The control allows its trade mark to be used only if butter is produced under conditions the most sanitary, scientific and skilful that can be applied to the industry. So it should be all round. There

should be a guarantee to the public that anything bought from a co-operative agricultural society represents a standard of quality in the product and an avoidance of waste in its manufacture which is the very best that human skill can accomplish.

But there is more—and in this that follows, as in all my co-operative faith, I have to acknowledge my deep indebtedness to Mr. George W. Russell, the Editor of the "Irish Homestead," for years past, and I hope for years to come, the spiritual head of the movement for co-operation in agriculture.

The Influence of Town on Country Life.—The greatest need of the movement now is vital heat, an ideal to work for—a soul to warm it up. At present its body and bulk are more apparent than its soul. Country people are the great stable human element in the life of a nation, and certain elemental human virtues are found more often in the country than in towns. Yet there is, on the whole, a steady flight from the land, not only here but in Ireland, in very many countries of Europe, and in America. Of the millions who go from England to the United States none go on the land, for the agricultural population there has been stationary for half a century. Why should rural life seem in danger of breaking up? The beast and the bird have tended to replace man in England, deer to replace man in Scotland, machines in America. Why? Partly because the city is always wresting from the country its arts and industries, and those which it cannot convey to the town it tries to control. Weaving, spinning, boot-and-shoe making, brewing, tailoring, hosiery and many other employments have gone irrevocably from the home to the factory. A crowd of keen-witted business men have come with offers to the farmer. They will sell his stock for him, market his produce, manufacture his bacon, bake his bread, and wherever the country dweller has given way and yielded to their insidious offers, he has become poorer than before, his intellect less active, and the countryside has grown more helpless and deserted.

Some people criticise agricultural co-operation as confirming and intensifying this tendency. They think of a society only as a set of farmers who have combined to get an expert business manager to do for them what they used to do for themselves. I hope to show that it can be more than that and can greatly increase instead of diminish the farmer's interests, and give him opportunities for the practical application of his citizenship that he has often hardly yet dreamt of. . . . But as to the break up of country life; on top of the tendency to

remove agricultural industries and interests from country to town has come an enormous facilitation to travel. The world is all spread out before the agricultural labourer and before the farmers' sons and daughters to choose where they will live, and the general tendency has been for them to go partly to the towns, partly to land in other parts of the world, where there is more freedom, more life, more chance for individuality, even though work is just as hard or harder. The War will increase this tendency. Soldiers long for home now, and no wonder. "They'd be as pleased with me at home now as if I was a new kitten," said one of them recently. But they will be dull in the country after a bit. They will want to work in association, not alone. They will want hard, good brain work, something to grip, an absolute equality of mind with mind. Unless the country is to be different in the future from the country of the past, they will not stay.

Organisation after the War.—The country must create for itself a better civilization. This does not only mean that there must be surplus wealth to spend on something more than the bare necessities of a decent existence—though that is part of what is necessary. The power to organise the use of this surplus wealth is the other part. If it lacks this power the country is done, for organised industries and communities will always wrest surplus wealth from the unorganised. There will be plenty of this organisation all round the country. We shall have an era of organisation after the War that we have never yet known. Trades will be organised into trusts, international, impalpable, but very strong and extremely difficult to control. Very definite international action by Governments will be necessary if we are not to be the victims of these trusts, but that is another matter.

Against these organisations a country organisation which looks only to Westminster will, in my humble opinion, do little good. It could do very little in the best circumstances, and circumstances will not be of the best. The movement of self help, the mutual aid given by men to each other, opens up infinitely more noble and inspiring vistas—and more profitable vistas. It is the co-operation of men to wring from Nature and Life the utmost they can give which is the organisation that inspires—and without inspiration organisation is nothing. All classes in the country should take part in this organisation. That is quite essential, but it should be the subject of a separate paper. Here I will only say, dogmatically, that the worker will not take part

until he has two things—a real interest in the land, and a surplus of wealth beyond his normal daily needs. Without them he will organise against the other interests of the country, and no amount of talking to him for his good will prevent it, for he is far too sensible. I do not know any single panacea for giving the worker these things—hardly even socialism. Allotments and small holdings—if there is far greater power of getting them—will help, and colony settlements, and profit-sharing on large farms, and a really free cottage, and the regulation of wages by the Wages Board. Only if these things and others are given, and abundantly, is there hope of a real organisation of a country civilization embracing all classes. But the organisation itself should depend on the co-operative society.

The Future of Agricultural Organisation.—The rural community must make it their steady, persistent and fundamental policy to work towards complete control over the manufacture and sale of all the produce of the countryside, its livestock, crops, by-products, and the manufacturing businesses connected with them. Societies now specialised should become general purpose societies. With whatever primary object a society is formed it should have its agricultural store, its credit and banking department, its small produce department, its land-renting or owning department. But there should be more than these forms of organisation for profit. The good society should go steadily and persistently from strength to strength. "*Nihil humanum alienum a me puto*" (there's nothing human that is not my job) should be its motto. Its most important department should be that of the public good. It should promote village and home industries so as to give interesting work for women. It should make our hedges bear fruit trees rather than thorns, and see that this and other communal property is respected. It should be able out of its profits, almost without feeling the burden, to build village halls and recreation rooms, to start libraries and reading rooms, to run a cinema—as the agricultural co-operative society at Enniscorthy in Ireland has lately done.

It should be a movement dealing with life itself and trying to create conditions in which a higher humanity will be possible. It should aim at creating a social order where the struggle for existence will give way to a brotherhood of workers; where men, dependent on the success of their united endeavours for their own prosperity, will instinctively think first of the community to which they belong.

Surely in this there will be an appeal even to our friends the big farmers. I have never thought that they could make very much for themselves out of agricultural organisation—financially. If they do without it they will still do well, and they can look after themselves. But by throwing themselves into the movement they can look after the community to which they belong, and this will give them far more of the best things that life can offer. Certainly in no sense will it be a narrowing, but rather a great broadening of their lives.

The Advantages of Agricultural Organisation.—I now come to the special application of my subject. Please concentrate on three points which I hope have emerged sufficiently, though I have touched some of them only in outline. (1) Agricultural organisation means saving in costs of production. (2) Agricultural organisation can guarantee the consumer the best article in the best condition. (3) Agricultural organisation contains the seeds of a better and fuller life for the country community. The general conclusion which I suggest is that an industry if run on these lines deserves the support of the community, if not, not.

Guaranteed Minimum Prices.—To come at length to the business in hand—what the farmer means by the support of the community is guaranteed minimum prices for his produce extending beyond the period of the Corn Production Act, and a revision of the Corn Production Act prices for grain in view of the increased cost of production. He is naturally very sensitive on these points, and very anxious. He wants the Government to commit itself, but the Government is thinking of many things. Also, and I say this with complete conviction, the question does not depend on what any Government says, but on what the great mass of intelligent men and women in the country think. The farmer has to put his case in a way which will convince them of its justice. That is what matters. The farmer starts on his path of carrying conviction to the urban voter with some things in his favour, some against. In his favour the country has realised that he has worked very hard at food production under very difficult circumstances, and that if he had not we should have been far hungrier than we have been—we might even have lost the War. They realise that without the power of being self-supporting in an emergency we may be in a very tight place if another emergency arises. Our food supply is our weak spot. Also it is realised that graduated minimum prices are not the same as protection.

All hope for protection for agriculture by duties is utterly vain. German submarines gave us enough protection in favour of home-grown food to last us a lifetime. There is no chance whatever of our seeing any system which would in any way artificially increase the cost of the food we buy, except for purposes of revenue. But guaranteed minimum prices to home growers are quite compatible with giving everyone their food at the world's lowest prices. Under that system the general taxpayer, in return for value received, makes up to the producer the difference between the price which he can obtain in the open market, and certain prices which are necessary in order that food production may be carried on in the way which the State demands. And if the great mass of town voters who will control Parliament succeeds in placing the great mass of the burden of post-war taxation on the shoulders of those better off than themselves, as seems very likely, they might view the finding of the money to guarantee certain prices to the producer with equanimity. On the other side of the account we must admit that there is a strong prejudice in the minds of masses of townsmen against the farmer and the landlord. To them the farmer is an arrant profiteer, the landlord a blood-sucker. As to the landlord, I claim confidently that no other class has suffered anything like the same diminution of income owing to the War. The way they have, in the main, gone steadily on without trying to increase rents, even to cover extra tithe and taxation, let alone to cover the increased cost of all the work they have to pay for on their estates, without thought of actually increasing their incomes, still less with any notion of trying to have the same real income in purchasing power as before the War, without even imagining that the War could bring them profit (as it has to so many other classes) fills me with amazement. Do you know how much of the calculation of 2s. 3d. as the producers' price for milk represented rent? Not one townsman in a hundred would believe the answer, which is 0.44 of a penny, a tenth of a penny per quart, one per cent. on the retail price. As to the farmers profiteering, farmers in the main have not deliberately profiteered, though they have profited. But let us realise that when excessive claims have been put forward on behalf of farmers, as has unfortunately been done, untold harm is done to the interest of the whole agricultural community. They may get an extra pound a ton for their hay or potatoes now, but it is money dearly won. On balancing up pros and cons, however, I think it reasonable to conclude that the people of this country

would listen to proposals to organise the agricultural industry on a better business basis, even if this organisation involved guaranteeing minimum prices, with patience and without prejudice, and this is something to start with.

My suggestion then is simply this : If guaranteed prices are to be asked for it should be only on a basis which will keep under cultivation an area necessary to make us self-supporting in an emergency, and will give to all engaged in agriculture fair profits *if they organise their industry in the completest and best way possible*. I do not go into questions of areas to-night. On that I accept the teaching of Sir Daniel Hall, confirmed, as it was, by the paper which Mr. Lennard read us a fortnight ago. It is the idea of calculating the prices on the basis of a thoroughly organised agriculture that I commend to your consideration.

If the urban consumer is to be expected to square up to the policy of permanently subsidising food production, the least he can ask is that all factors due to human backwardness or lack of enterprise shall be entirely eliminated in reckoning the bill which he may be called upon to pay. He will have to learn to make a very ample allowance for the changes and chances to which agriculture is exposed, which no human skill can guard against. The cutting of a field of corn may be turned by 24 hours' rain and wind from an operation costing 5s. to one costing 35s. an acre. Such weather as we have had in the North and North West this year may, indeed, prevent there being any harvest at all. All this must be allowed for. But further than this no one need go ; and we may be pretty certain that under the terrific burden of taxation which we shall have after the war the community will not go. The present state of things will be a lesson, or should be. We have, for instance, recently had to fix milk prices. It was essential that there should be no reduction of the milk supply. What was it, therefore, necessary to do ? We had to find out what was the cost of milk production in that district in Great Britain where it cost most, and give the producers there a reasonable profit. The producers there may not practise milk recording, they may keep bad bulls, there may be no co-operation in dealing with their supplies. No matter. We were at their mercy, and so we shall have milk this winter at 10d. a quart. That sort of thing is not good enough, and we ought not to be asked to repeat it.

The Need of Organisation.—It is fair, then, to ask the consumer who wants a secure food supply to make its production

reasonably remunerative on a strictly business basis of organisation of the producing industry. But the converse has to be considered. Is it fair to expect the farmer to organise his industry on this basis? I think so, now as never before. Farmers now have, or should have, more capital than they have ever had before. They have been in the past, in many instances, more or less in the hands of auctioneers and traders. If they have not got free, or cannot now get free, they deserve very little consideration. They are, in fact, free to make what they like of their industry. The War has, in many ways, taught them to combine. They only need to use their power of combination for the public good as well as for their own to have before them extremely bright prospects. There is also now, clear for all to see, a strong compelling force, though it is in the nature of a goad, and it would be so much pleasanter to lead than to drive. It is this: that unless farmers organise themselves from within in co-operative societies, they will be much less pleasantly organised from without by State officials. The fear of controllers and inspectors and orders may do what neither self-interest nor public spirit can accomplish. But if farmers refuse to organise, what then? The answer of the State will, I expect, be perfectly prompt. Let us take over, and let them give place to those who will. I do not personally think that land nationalisation is better than my ideal of a truly co-operative community working out its own salvation for itself, but there are many millions of people in England who do, and unless they see very great changes taking place in the organisation of agriculture very soon these numbers will steadily increase.

But you may say, "Why all this bother? There is not enough in agricultural co-operation to make much difference in calculating guaranteed prices." It may, in fact, be argued that the factors of climate, weather and soil count 90 per cent. or more in the price of agricultural produce, the difference between good organisation and bad only 10 per cent., or less. I do not know how this may be. That and many other things in the economics of agriculture badly want working out. I only know that when agricultural co-operation was started in Ireland fertilisers came down 50 per cent. When the Irish Agricultural Wholesale Society took to providing dairying machinery, prices dropped 20 per cent. And we have, fresh in our minds, the figures that Mr. Guy gave us of the avoidable elements in costs of agricultural implements.* But it is the

* See article in this *Journal*, July, 1918, p. 402.

principle of the thing more than the amount that matters. If the whole organisation of the business is such as will give the consumer the best possible article at the lowest price he may fairly be asked to see that his food is produced on a basis which will first give the worker a living wage and a bit over for civilisation, then the farmer a reasonable margin of profit, and then the landowner a fair business return on the actual value of the work he does and of the equipment of the farm for which he has been responsible. The actual amount which the community saves by paying a price on a real business basis is a secondary matter.

The Future of Agricultural Prices.—There is one last point in regard to guaranteed prices that farmers should have in mind when they put forward their case. Guaranteeing a minimum price must carry with it the claim by the community to take produce at a maximum—not necessarily the same, but probably not very much higher. What world prices will be after the War we cannot tell. But if the State agrees to make farming remunerative, however low world prices may be, they will certainly expect the farmers to sell without any excessive remuneration if world prices are high. Remember that during the War the State has learnt to be a wholesaler on a gigantic scale, and in some ways not at all a bad one.

I can see that some of my friends among the farmers, if by this time I have any left, are looking pessimistic. I can imagine them saying "Its a gloomy outlook. We are to cultivate as if nothing depended on organisation. We are to organise as if nothing depended on cultivation. So, peradventure we may possibly win the chance of making a bare living from England's future rulers." Cheer up, it will not be as bad as that. But even if it be, has not the War taught us that it does not much matter whether we make much money or little, provided that we have a steady hard job, worth working at, that we understand, and that we can work at it in association with men whom we know and trust, and who know and trust us? This, at any rate, is the least that agricultural co-operation has to offer, and I think that even on this basis the offer will not be made in vain.

I must append a story which some of us heard a few days ago. A visitor had gone round an asylum and was much struck by the small number of attendants. "What," he said to the superintendent, "would happen if your inmates were to combine?" "Oh," he replied, "that's all right, *lunatics* never combine."

AGRICULTURAL ORGANISATION.*

LESLIE SCOTT, K.C., M.P.

ENGLISH farmers have in the past troubled very little about agricultural organisation ; but the future success of agriculture, from the point of view of both the farmer's pocket and the Nation's supply of good food at a reasonable price to the consuming population, will depend on the degree in which we succeed in organising the industry. Of all our agricultural questions, this one of organisation is, to my mind, by far the most important.

By " agricultural organisation " I mean the *business* organisation of the industry ; an organisation by which the cost of production is reduced to a minimum ; by which the selling of the farmers' produce is effected on the best business lines and at the lowest cost ; by which the whole commercial side of agriculture is directed by the best commercial brains that money can procure, and no one is engaged in it who is not needed, and every one who is engaged is efficient ; so that the industry shall not carry on its back any superfluous profit-takers. Under such a system the farmer can devote his whole time to the running of his farm and leave the buying and selling to men with commercial training who understand the job better than he does : but yet are so employed and paid that the farmer's interest is their interest. Every great manufacturing industry is organised to-day in this sort of way.

The Old Age.—To my thinking there are two features which stand out more clearly than any others in the picture of what British farming was before the War. (1) That the Nation took uncommonly little interest in it. To help the industry as a whole because the nation needed it never occurred to a British Government. (2) The complete freedom of the farmers and their independence of Government control.

How much was there of good and how much of bad in this state of affairs ? Freedom is good ; and I believe it to be absolutely essential to the welfare of this country, in the highest sense, that our farmers should remain a race of really free men earning their livelihood on their own farms, taking their own risk, and making their own profit. The preservation of their freedom is one of the first duties of statesmanship. But our

* Resumé of a Paper read before the Farmers' Club, 21st October, 1918. Reprints of the Address can be obtained from the Secretary, Agricultural Organisation Society, Queen Anne's Chambers, Tothill Street, S.W.1.

farmers have, perhaps, a little overdone the spirit of freedom. They were so independent in character that they insisted on being independent of each other, and were unwilling to enter into effective combination, so essential for business strength. Each farmer was like a Cyclops living alone on his own farm ; suspicious of his neighbour ; resenting help lest it should become interference ; often unwilling to learn new methods, and usually contemptuous of new-fangled science. There is a temptation when we look back to the State's indifference and aloofness, in those far-off days before the War, to think of it almost as an elysium ; but second thoughts remind us of the tragedy of the last two decades of the nineteenth century, when the low price of imported cereals, dictated by the competition of virgin soils and low ocean freights, made it impossible for the English arable farmer to meet the losses ordinarily incidental to bad seasons and ruined so many of them.

This is the other side of the medal, and freedom from State interference can be purchased at too high a price if it means that the industry cannot be carried on at a profit.

The New Age.—What, then, are the leading features of the new age ? At present agriculture is in the limelight, and the public is watching every movement of the farmers. Why ? Because the nation through the War has learnt what it was too stupid to understand before—*viz.*, that a productive agriculture is essential to its security, and, possibly, to its existence. The majority of the public see that we nearly lost the War through the German submarine, and that for the future we must be in a position to feed our population—or most of it—on home-grown food. In other words, the State from henceforth will regard itself as having a direct interest in agriculture. I believe that the days of State indifference have gone, never to return ; that, whether we like it or not, farmers will never again get the complete freedom which they had before the War. State control in some measure has come to stay. Whether the kind and degree of that control will be tolerable or intolerable will depend on the farmers themselves. To make it tolerable two things are necessary : (1) That they should produce the amount of food the nation wants, of the kind it wants, at the price it wants ; (2) That they should combine in an organisation which will be strong enough to insure that they are treated with justice and that the politician does not make impossible demands upon them. As I said before, the public has realised the importance of home production, but the great consuming population of the country does not as yet understand the

difficulties of the farmer nor the cost of production, nor does it care overmuch about his making a reasonable profit.

Another outstanding feature of the new age is to be found in the fact that leaders of commerce and industry have discovered the possibilities of good business both in farming and in farm products. Farmers, if they are not careful, may find their birthright taken from them. Capitalists are investing money in farming because they see that money is to be made by farming on big lines; in other words, by organisation. The small shopkeeper has in many trades been supplanted by the large multiple shop. Multiple farming has begun in this country on the same lines. A commercial company appoints a skilled manager and runs as one concern a number of separate farms, on each of which there is now just a foreman who was once an independent farmer.

Sir Daniel Hall has made us familiar with the idea of the very large 5,000 acre farm.* Of "commercial farms" of the sort it is well that we should have a few. It is one way whereby the farming of the country can be made more efficient. If it were the only way, economic pressure might force us to adopt it generally. But the drawback of it is that the nation would lose its race of independent farmers, who stand for so much that is strong and good in the fibre of our national character. And it is not the only way. I am convinced that by organisation on co-operative lines—i.e., through agricultural co-operative societies—most of the advantages of the large commercial farm can be attained without sacrificing the independent farmer.

And the farmer's birthright is not only farming. Why should he lose all control of his produce at its very first stage—viz., that of raw material? Why should he not follow it through its later stages till it reaches the consumer, and so share in the greatly augmented price that the consumer pays, and at the same time benefit the consumer by reducing the intermediate costs of manufacture and distribution, and letting him have his food at a lower price than before? The farmer grows the wheat. Why should not farmers join together and do their milling for themselves, and retain the offals of their own grain?

To-day they sell live stock to the amount (on pre-war figures) of over £50,000,000 a year. Why should they have no share

* An Article on the large farm as it might be organised on a commercial scale by women, was contributed to the issue of this *Journal* for October last (p. 785) by Sir A. D. Hall. See also *Agriculture After the War*, by Sir A. D. Hall.

in the fresh meat trade or in the valuable by-products of the slaughterhouse? Again, take milk. By a mere act of will the farmers of England and Wales who produce the milk could say, "We will do this business for ourselves." The man who controls the raw material controls the manufactured article. Every American manufacturer knew it long ago—and the Germans too. And now the war has taught it even to English manufacturers. Why don't farmers combine and take business charge of their own business—at least of their own wholesaling—even if they don't do the manufacturing or retailing? There is literally only one obstacle in the way, and that is their own unwillingness to improve their own business position. There is one certain road to success, and that is their own free decision to do it.

It is not only from the ordinary capitalist that the capitalist danger can be discerned. The small consumer has become a capitalist in these days, and he too is having a slice at your birthright. There are some 12,000,000 industrial co-operators. They are all consumers, and as consumers they are coming into agriculture. In the "Co-operative News" (which is the paper of the movement) for the 7th September last, it is stated that the Co-operative Wholesale Society—which has a huge capital—now owns 45,000 acres of land, including over 5,000 acres recently acquired, in regard to which they say that "the land will be used to develop a co-operative milk supply, and will constitute part of what we hope will ultimately be a huge system of co-operative dairy farms."

We may now sum up the chief features of the new age of British agriculture in one sentence. The State, the capitalists, and the consumers all have it in their mind to control the farming of the country. On the other hand, it is in the real interest of the nation that the farming class should be preserved as a distinct class in the community, and that they should continue as free men, and not become mere salaried bailiffs.

If you are to be kept alive—and in sound health—for the nation's benefit and your own, you must do two things:—(1) You must satisfy the State and the consumer by meeting the requirements of the population in regard to quantity, quality and price; (2) You must run your business efficiently, or it will be taken from you by the man of business. There is only one way in which you can do it, and that is by organisation.

What the Farmer would Gain by Organisation.—I have approached our subject from the point of view of the industry as a whole, because it is only by taking the big view and considering the general trend of the times that the absolute necessity for organisation becomes clear ; and it is this argument which is likely to have most influence with the big farmer. He knows that as well as being an expert in production, he is no mean hand at the commercial side of farming ; and he is naturally inclined to say, " What am I to gain by co-operation ? "

My first answer is that he can gain by co-operation (which is only one form of business combination) just what every big concern gains by joining with other big concerns. The new combined whole is greater than any of the individual businesses, however big they were. Why have some twenty leading banks of the country recently amalgamated so that now there are only five ? Not because the twenty banks were each of them inefficient ; but because their efficiency, great as it was, is made greater still by combination. It is plainly to the interest of the biggest farmer to take the lead in the campaign for organisation upon which the salvation of British farming depends.

There is another argument, and one that will, I think, appeal to the big farmers even more—that the small man depends infinitely more than they do for his success in life upon effective organisation, and that the big farmers can render him invaluable help by throwing in their lot whole-heartedly with the cause of agricultural co-operation. No man who farms less than 300 acres can be called a big farmer, yet only three out of every hundred farmers in this country farm more than 300 acres ; only thirteen farm more than 150 acres ; and only half farm more than 50 acres. England, then, is a country of small farmers ; Wales still more so, and the big farmers will, I feel sure, respond to my appeal, and extend the disinterested hand of help to all those small men.

There is a side issue, closely affected by our subject, which is very dear to the hearts of all of us, and that is the returning soldiers and sailors after the War. I was a member of the committee appointed to consider their settlement and employment on the land. The committee was unanimous in thinking that it was most important for the smallholder to belong to a good co-operative society, and doubly so if he came to his small holding without much previous experience. In order that they may learn something of their profession—for the life of a smallholder is both hard and difficult—they ought in the first instance, if possible, to be employed as labourers on the

farms ; though the experience of inefficient labour which farmers have recently had will not make it very easy to get untrained men taken on. But the prospect of a small holding in later years and of making a reasonably good living out of it is a great incentive to hard work, and it will make these men learn their work on the farm much quicker and better if they can rely on getting in the future, when they pass on to a small holding of their own, all the help that a completely organised system of co-operative societies alone can ensure.

What Organisation means in Practice.—Having dealt with the general reasons in favour of organisation, I want to see now what it means in practice. Experience has proved that it is not much use attempting to transplant the particular kind of society that does well in a foreign country. In Denmark there is a vast number of small societies, each for one type of business. Here in England and Wales we have found that the kind which serves our needs best is the large society—covering a considerable area, and conducting more than one type of business.

There may be several sides to such a society's work. *Buying co-operatively for its members what they want and selling for them what they produce are the two chief ones.* Of these two, it is easier to begin with the buying side ; and most of our successful societies have begun by the purchase for their members of farm requirements, such as fertilisers, feeding-stuffs, seeds, implements, and so on. As a general rule (and we need not trouble about the exceptions) there is nothing a farmer buys which cannot be bought better if bought through a co-operative society than bought by the farmer individually. The rule is of general application, and not confined in any way to a farmer's business. If you want to buy efficiently, you must go to the best sources of production. You can only do this if you can buy in sufficiently large quantities ; and you can only get the best price if you are a customer whose custom means a very great deal to your seller.

One thing more. The man who buys for you must be a first-class buyer ; and if you have to purchase different kinds of articles you must be able to command the services of a first-class buyer for each kind of article. If you are to employ different men for each class of requirements you must have enough trade to afford the salary of a good man in each line and to keep him continuously busy. For this purpose combination on co-operative lines can be made just as effective as combination on joint stock lines. It is obvious that a thousand

farmers bulking their purchases of fertilisers and placing one order can obtain better terms than any one of them could obtain by himself. This they can do by joining a co-operative society and employing a manager who understands the fertiliser trade.

You may say that whilst an average 1,000 farmers joined together in a farmers' trading society might afford one manager and a couple of sub-managers, they would not have enough business in each separate line—seeds, feeding-stuffs, fertilisers, machinery, etc.—to make it remunerative to employ an absolutely first-class man for each department.* I agree. But assume that the society of 1,000 farmers joins with 99 other societies of 1,000 farmers each, so that we have 100,000 farmers in farmers' trading societies, if all these societies combine for the purposes of joint buying and run their own wholesale society, they can send to it the bulked orders of their various members; and the wholesale society, now having behind it this combined volume of trade, can easily afford to employ the very best men in each line, can command the very last discount from the manufacturers, and can import whole cargoes on the very lowest c.i.f. terms.

And if 100,000 farmers can thus join together and win such a commanding position, what is there to prevent the 423,718 farmers, returned in the last annual Board of Agriculture statistics as the total number of farmers in England and Wales, from joining together in the same way and thus controlling every ton of the farmers' buying market in this country? There is only one thing in the way, and that is the mental slowness of the British farmer to see his own interest, and I hope farmers will not be offended by my frankness. Farmers can command the position absolutely if they will only say the words "we will join together"—*and do it*.

Selling Co-operatively.—So much for the buying side. But though less has been done as yet by co-operative societies on the selling side, it is in the long run the more important of the two, for the reason I have already given, *viz.*, that it is only by concerted action that you can retain control of what you produce in any one of the later stages than that of the mere raw material—and in each stage there is as much money to be made as in the production of the raw material.

Direct profit is not the only gain. Supposing the bulk of the wheat crop were disposed of through your co-operative organisation, you would not only make sure that each farmer got from his own society the full price that the quality and

condition of his grain justified, but your wholesale society would make it a term of its sale to the millers that they should return the whole of the offals. You would thus kill two birds with one stone, selling your corn and making sure of your feeding stuffs, and the millers would know that if they were not reasonable the capital resources of the Farmers' Wholesale Society would enable you to start milling on your own account.

Up to date more has been done on the selling side in milk than in other produce—probably because the advantages of common collecting, cooling and selling are peculiarly obvious in the case of milk. This summer our dairy societies have been dealing with about 150,000 gal. of milk daily.

Fruit and market garden produce is another line where co-operative selling has made good progress for a similar reason, *viz.*, that everyone knows that fruit must be well graded and packed to sell well. Indeed, the Americans say that "a well-packed article has already sold itself!"

Poultry and egg-collecting and bacon-curing are other subjects of co-operative activity, and during the last twelve months we have started what I hope will develop into a very big thing—co-operative slaughterhouses. We have five of these in full work now. If the farmers will take it up, we can, with the help of our wholesale society, make a very, very big thing of it, and, after the war, fight every foreign meat trust successfully and sell to the consumer at the lowest price for British meat.

The Effect on Production.—The extension of the buying side of co-operative trade will make for better farming by ensuring a good quality of feeding-stuffs and fertilisers, for every society will see to the analysis. The level of farming, however, can be raised in other ways too. A State or county expert adviser is looked on a little bit askance by the ordinary farmer—probably because of a feeling that the official expert has no direct interest in the pecuniary results of his advice. If I, however, as a member of a co-operative society, voted for the employment of an expert by the society, I should at once feel that the man was my servant, and that my interest was his interest, and be glad enough to take his advice. Through the societies a much more intimate relationship could be set up with the agricultural education system of the county. Besides, in farming the lesson that really teaches is the object-lesson: seeing is believing when you see the difference before your eyes of a crop grown in the right way and one grown in the wrong way; inches and yield are convincing. So are the properly kept milk records of a

good dairy herd, properly managed. Why should not societies arrange for demonstrations in cultivation, dairy records, cost accounts, etc., on the farms of selected members in different parts of their district? It would solve the difficult and pressing problem of demonstration farms.

Agricultural Credit.—Another need of British farming can be met by co-operative organisation, and that is the supply of adequate working capital for the small man—the best manure for both grass and arable. The big farmer can get it from his bank easily enough; but the small man can't or won't. And yet the personal credit of the keen, hard-working small farmer who means to get on is about the best security in the world. If he will only buy his requirements from his society and undertake to use them on his farm, the society can advance him a loan at interest, and he can get his full bonus for a cash purchase, and his society is perfectly safe. This is the credit scheme which I put before the Agricultural Organisation Society, and they have adopted and Lord Selborne's Agricultural Policy Sub-Committee have approved in their report (Cd. 9079). We hope, with the help of the banks and our wholesale society, to get it into working order before 1919.

Labour-Saving Machinery.—Indeed, there is hardly any department of the industry where co-operative organisation would not bring advantages. Take, for instance, the question of labour. With present rates of wages, arable cultivation has gone up to between £3 and £5 per acre per annum. At this rate economy in labour is of the highest importance. The chief saving, I imagine, is to be looked for from labour-saving machinery. The small farmers of the country cannot own much of it, or, if they do, cannot give it remunerative employment because it will be lying idle too long. If they want it, they have got to hire it. Which will be the cheapest for them—to hire it from a contractor or for their own co-operative society to own it and hire it out to them? Why should not machinery, with expert labour attached, be regularly hired by the co-operative society to its members?

Improvement of Stock.—Or, take the question of livestock. Why should not the society own bulls, stallions, boars, etc., and hire out their services? The use of inferior bulls is a curse of British farming. We all know how much the milking herds of the country could be improved.

This is the general policy of the Agricultural Organisation Society. The membership of affiliated farmers' societies to-day is about 60,000, and of allotment societies about 70,000, and

the total turnover about £8,000,000 sterling : a small proportion of the whole, I agree, but still substantial and rapidly growing.

Right Kind of Society.—An agricultural co-operative society formed in the interest of all farmers of the district should embody the following principles in its rules :—

1. Membership should be confined to cultivators of land.
2. Capital should be found by the members.
3. Interest on capital should be limited to a reasonable rate, say 6 per cent.
4. The total issue of share capital should be unlimited, so that shares should not enhance in value.
5. Balance of profits should be distributed amongst the members in the form of a bonus on business done through the society.

A society on these lines can be registered for a sovereign and will not be subject to payment of income-tax. It is the only form of combination which will make certain of *all* the profits from combination accruing to those in whose interest the combination is formed.

I am not a believer in small societies as a rule. Efficiency is immensely promoted, in my opinion, by having a strong society covering a fairly large area, such as one or two counties, and combining all the various functions that I have referred to above. It is only by doing business in a fairly big way that the society can afford to have the best head manager and managers of departments, and do its work at the minimum of cost in proportion to turnover.

Agricultural co-operative societies do not, like joint stock companies, lay themselves out to make profits, as their main object is to supply their members with the best goods at the lowest price. They must, however, allow sufficient margin in their prices to cover trading contingencies, and the profits, if any, arising out of this margin are distributed in the form of bonuses.

The Agricultural Wholesale Society, which the Agricultural Organisation Society has helped to get into going order this year, is now in full swing so far as Government control over supplies permits it, at 48, Mark Lane, near the Corn Exchange. A reasonable scale of share capital for societies joining it has been agreed to (£1 per member plus 2 per cent. on turnover for farmers' societies and 1s. per member plus 2 per cent. on turnover for allotment societies), and as its usefulness becomes apparent I have little doubt that it will be easy to increase its capital.

The directors are elected by the societies, and there are sectional boards—farmers' trading, dairy and allotments, etc., elected by the societies in each section, so as to make sure that each department is directed by men with special knowledge, subject only to the control of the general board.

Agricultural Organisation Society.—The duties of the A.O.S. are to help the farmers, smallholders and allotment-holders of the country to form themselves into co-operative societies on sound lines, and to help these societies with expert advice in various ways and get them new members after they have been once started. The cordial relationship which has been established between the allotment-holders affiliated to the A.O.S.—and there are now about 70,000 of them—and the farmers is one of the best bits of work the A.O.S. has done for the future of agriculture in this country. The A.O.S. has been reorganised this year and put on a purely democratic basis. A great majority of its governors are now elected by the farmers' societies in the fifteen branch areas into which England and Wales has been divided; and each branch has been given a large measure of local autonomy under its local committees elected by the societies trading in the branch area.

In addition, the A.O.S. branch committees might act as local advisory boards for the A.W.S. if invited to do so. The whole movement is therefore now democratic. The farmers' organisation is run by the farmers for the farmers.

CO-OPERATION AND THE ORGANISATION OF THE DAIRY INDUSTRY.

Need for Home Production.—For some years previous to the outbreak of War, the imports of dairy produce into this country were rapidly declining, owing to certain of the exporting countries requiring increased supplies for their own use. In this connection comparisons between the imports of dairy produce from the United States and Canada during the years 1911 and 1913 respectively are instructive.

TABLE I.—CHEESE IMPORTS (cwt.).

					<i>Canada.</i>		<i>United States.</i>
1911	1,473,275	..	150,321

1913	813	..	164

The diversion of merchant shipping to military purposes during the War has made this country even more than ever dependent upon home-manufactured dairy produce—a condition of things which is likely to be maintained if other countries continue to increase the competition against us for outside supplies, as may be expected.

The present situation affords a golden opportunity to the British farmer, which it is hoped he will seize, and, by organising his business, place himself in a position to assist in solving the problem of our nation's future food supply.

In order to do this to the best advantage it is necessary that the dairy industry should be thoroughly organised. This can be accomplished in two ways—(1) by private enterprise ; (2) by farmers' co-operative dairy societies.

(1) **Private Dairy Companies** have long recognised the need for organisation, and have established milk depots, condenseries, cheese factories or creameries in localities which offered unusual prospects of good supplies of milk or cream. These companies have served a very useful purpose in the past, in providing up-to-date buildings and machinery for pasteurising and cooling milk, before despatching it to their town depot, or for making cheese, cream, butter, or condensed milk, whenever the milk was not required to meet the demands of their customers. In the

majority of cases, however, the farmer who is the producer of the milk does not receive any consideration beyond the purchase of his milk at the lowest possible price—the natural objects of the company being to swell the shareholders' dividends and to gain a trading supremacy over rival firms.

(2) **Co-operative Dairy Societies** of producers alone will enable a farmer to meet the requirements of the public on the same footing as his overseas competitors or the private dairy companies. The dairy farmer of the future must be prepared to meet the wishes of the public and to supply the consumer with a uniform quality of the highest possible standard in regular quantities. This he can only do by organising the dairying branch of his business on co-operative lines, by which means every farmer, however small, is afforded the same facilities as the largest dairy concerns for manufacturing and marketing his produce in accordance with the most approved methods. In addition to improving the quality and regularity of his output it should be remembered that once he becomes a co-operator, every member has a voice in directing the policy of his own society's factory, and instead of the surplus profits going to a few shareholders, they are refunded to him in proportion to the amount of milk supplied.

Need for Co-operative Effort.—The producer who sends milk direct to a town retailer is often not in a position to guarantee a regular supply, because in winter his cows will probably yield not more than half or even a third of summer quantities. The following table, showing the weekly amounts of milk sent away from two separate farms, illustrates this point clearly. It is taken from Dr. Stenhouse Williams' pamphlet dealing with the "Wastage of Milk."

<i>Supply Mid-week in Month of</i>	<i>Farm I.</i>	<i>Farm II.</i>
November, 1915	391 ..	219
December, 1915	270 ..	162
January, 1916	272 ..	168

Quite frequently this type of producer has no means of dealing satisfactorily with surplus milk, and the result is financial and food loss. He rarely has adequate means for properly cleansing and sterilizing the milk cans, which are often returned from his

customers in a sour and dirty condition, and if milk is returned in these improperly cleansed cans, he has to bear heavy losses through his milk going sour *en route*. He must also run the risk of making bad debts as well as having deductions made from his account through wastage in transit.

If, on the other hand, he makes butter on the farm, he is, in ordinary times, faced with a glut on his local market during the early summer months when the wholesale price falls to such an extent as to yield an insufficient return. At other times he has scarcely sufficient butter to meet his own domestic needs.

If he elects to make cheese at home, he may find it unprofitable to do so (compared with the co-operative factory system) unless he is in a fairly large way of business, and deals with sufficient milk to make it worth his while to purchase proper plant for the purpose. Having made his cheese, he must wait until it can be sold before he can get any return for his labour, and because he had only a comparatively small quantity to dispose of, he is limited to his own local market, and must needs sell at whatever price is prevailing there at the time of sale.

Advantages of Organising to Farmers.—When a farmer becomes a member of a co-operative dairy society the trouble of manufacturing and marketing his dairy produce is undertaken for him. Briefly summarised, some of the chief advantages which he gains by becoming a member of such a society are :—

(1) He is paid fortnightly or monthly for all the milk he delivers to the factory, and is therefore able to meet his obligations more regularly.

(2) Means are provided whereby his surplus milk is dealt with near the source of production, thus preventing the heavy losses which often occur when more milk is consigned to large towns than is required by the demand.

(3) If he is a small farmer he is provided with a means of obtaining to the same extent as up-to-date and efficient labour and machinery as the larger and wealthier farmer.

(4) The amount of labour required to deal with an equal quantity of milk is less. For example, 500 gals. of milk dealt with on 10 different farms would require 10 cheesemakers with 10 sets of apparatus, whilst in a factory the work could be done by one cheesemaker, with one assistant, and one rather larger plant.

(5) Having larger and more regular quantities of cheese for sale a greater choice of markets is available, and the society is not obliged to sell to any particular

buyer, as the farmer who has only his own small individual lot to offer often must do, no matter how low the price may be.

(6) When a factory has established a reputation for its cheese, buyers are anxious to take its produce at top prices, because it can be obtained more uniform in quantity, form and flavour, than when it is produced on separate farms.

The foregoing advantages refer mostly to those gained by membership of a wholesale milk depot or cheese factory, but in more recent years co-operation has been adapted to the distribution of milk in towns. That some organisation in this direction is needed will scarcely be denied. The familiar sight of several horses and milk carts, all selling milk in a short street at one and the same time is, on the face of it, not only unnecessary but a waste of time and effort.

The saving of labour by the adoption of this form of co-operation is enormous, and in those places where it has been adopted, as many as one-third of the original number of horses and vehicles employed in distribution have been taken off the streets through the organisation of the rounds. The chief advantages to a farmer through becoming a member of such a society may be described briefly as follows :—

(1) Farmers have only to deliver their milk at the depot of the society, having no further trouble or individual expense with it. Often the milk is collected at the farmer's door.

(2) The system allows the farmer more time to concentrate on his farming operations and thus increase his production.

(3) Milk is paid for at regular intervals without any deductions, if it is delivered in a saleable condition at the depot.

(4) Members are relieved from bad debts.

(5) The depot may provide a market for other produce, such as eggs, poultry and garden produce.

The social benefits to be derived from membership in a co-operative society must also not be overlooked. It often proves to be the first introduction which a farmer has to ordinary business routine, and his term of office on the committee of the society not only promotes a freer interchange of ideas with his fellow-members, but by introducing him to habits of system, inquiry, calculation, regularity and order makes him better able to carry on his own business successfully.

Advantages of Organisation to the Consumer and the Nation.—

The advantages of co-operation are not on the side of the producer only. The nation as a whole and the consumer as an individual may reap certain benefits from its establishment.

Any expedient that will increase the supply of home-grown produce, eliminate waste, regulate supplies to meet fluctuating demands, improve the quality of produce, as well as standardise and stabilise such an important industry as dairying, should receive every encouragement and support.

It is claimed that co-operation can do all this, and do it in the least irritating and most efficacious manner. The following is a brief summary of the advantages derived by the consumer from co-operative organisation :—

(1) By ensuring a permanent market for his milk it induces the farmer to increase his production to the utmost yielding capacity of his farm.

(2) By paying for quality as well as quantity and the enforcement of stringent rules, a high standard of quality is maintained.

(3) By installing refrigerating machinery with brine cooler and cold storage accommodation milk can be supplied to be consumed in towns in such quantities and at such times as it may be required, thus balancing to some extent the ebb and flow in the supply and demand of the new milk trade. This treatment also eliminates losses due to souring and gives a more hygienic as well as a more regular milk supply.

(4) By converting surplus milk into cheese the nation's food supply benefits.

(5) By keeping pigs to consume the whey—either co-operatively near the factory, or on the farms of the members—a large amount of pork and bacon is added to the national larder. In 1915 one society alone fed pigs worth £3,000 with the help of whey produced from about 1,000 gal. of milk per day. Another society produces upwards of £60 worth of whey butter per annum.

In the past the neglect to put the by-products to their fullest use has resulted in huge losses to the nation.

Dr. Stenhouse Williams, of University College, Reading, in his pamphlet on the "Wastage of Milk," states that in two districts which he had under consideration, out of a total supply of 165,000,000 gal. of milk not less than 3,615,441 gal. were wasted, representing a loss of not less than 2 per cent. of the whole supply

According to statistics collated by Mr. W. Gavin, and published in Supplement No. 16 to this *Journal*, the estimated total consumption of milk in England and Wales in 1914 was approximately 810,000,000 gal.

If we assume that only 1 per cent. of this total supply was lost through preventable causes, we could, by preventing the loss, have added to our resources to the extent of 72,321 cwt. of cheese.

The Growth of Co-operation.—Co-operative dairying has been practised in this and other countries for the past 40 or 50 years, so that it is a proved proposition and long past the experimental stage.

Just before the outbreak of war in 1914 Germany had no less than 3,588 co-operative dairies established. The dairying industry in Denmark, Finland, Canada, New Zealand and Australia is almost entirely organised on co-operative lines. In Ireland co-operative creameries have to a very large extent superseded privately-owned concerns.

Both privately-owned and co-operative creameries have of late years turned their attention to cheese-making in preference to butter-making.

As a result of enquiries which were made and propaganda undertaken by the Royal Agricultural Society of England the first co-operative factory was opened in the town of Derby in the year 1870. The first factory which was built especially for that purpose was opened at Longford, about 10 miles from Derby, in the same year. The object of running the two factories concurrently was to show whether co-operative organisation was suitable—or otherwise—under either town or country conditions. The results of this experiment were so satisfactory that farmers in other districts began to combine for the purpose of building and equipping their own co-operative cheese factories. The following factories still continue operations on lines very similar to those on which they were originated :—

<i>Name of Factory.</i>							<i>Date of Establishment.</i>
Hopedale	1874
Manifold Valley	1874
Grange Mill	1875
Pipegate	1876
Gratton	1884
Croxden	1885
Mayfield	1889

Derbyshire and parts of Staffordshire were practically the birthplace of co-operative dairying in England, whilst Cornwall, Yorkshire and Leicester followed their lead, although at a later

date. The adoption of co-operative cheese factories and milk depots in Wiltshire, Carmarthen, Northumberland, Dorset, Suffolk and Cheshire, took place at a still more recent date; whilst in North Wales, where small farms are the rule, the idea was not taken up until 1917, and then as a result of the working of co-operative cheese schools at Llangerniew, near Abergele, and Chwillog, near Pwllheli, in that year. Since then five or six dairy societies have been registered in the North Wales area.

The Agricultural Organisation Society was inaugurated in the year 1901 for the purpose of furthering the cause of agricultural co-operation, but it was not until 1912 that a dairy branch was formed for the special purpose of fostering the establishment of co-operative dairy societies. The following table shows the increase in the number of such societies from the year 1913 onwards, in England and Wales :—

<i>Nature of Society.</i>	1913.	1914.	1915.	1916.	1917.	1918.
Cheese factory and milk depots	20	25	30	30	31	49
Milk retailing	3	5	5	6	7	7
Butter-making	2	2	2	2	2	2
Butter-blending	1	1	1	1	1	1

These figures include registrations which have been put through up to 31st March in each year. Three new dairy societies have been registered between that date and 31st October, 1918.

In 1916 returns were made by 35 dairy societies, which had a total membership of 4,082 and a turnover of £993,163, or an average of £243 per member.

Co-operative Cheese Schools.—Realising the vital necessity for increased cheese production, not only as a war measure but by way of compensating for decreased importations, the Board of Agriculture decided, in conjunction with the Cornwall County Education authorities, to establish a co-operative cheese school at Lostwithiel during the cheese-making season of 1916.

The school was established for the purpose of demonstrating to the farmers, in their own locality and with their own milk, (1) that better returns could be obtained from cheese-making than from butter-making, (2) the advantages of the co-operative factory system, and (3) to give those students who desired it an opportunity of obtaining instruction in cheese-making under factory conditions.

For the purpose of the school the Board of Agriculture loaned the necessary cheese-making utensils, and the County Education Authority supplied an instructress to take charge of the

school. The local committee of suppliers made arrangements for the required supply of milk, a suitable building, hot water supplies, and such assistance as the instructress required. (See page 322 of this *Journal* for June, 1918).

The results of the working of the scheme at this school were most gratifying, and led the Board to extend the scheme to nine new centres during the following year.

The total number and the location of these schools up to date are given in the following list :—

<i>Year.</i>	<i>County.</i>	<i>Location.</i>		<i>Result.</i>
1916	Cornwall	..	Lostwithiel ..	Society registered.
1917	"	..	Gwinear Road ..	" "

"	"	..	Llandegfan ..	—

Of the 18 cheese schools held this year four have already become registered societies and the remainder have the matter under consideration.

These Co-operative Cheese Schools form a suitable groundwork upon which to establish co-operative milk depots and cheese factories, and in order to give farmers every facility for the establishment of their own factories the Board of Agriculture, acting on the recommendation of the Astor Committee,* devised a scheme whereby newly-formed co-operative societies can be assisted in the matter of capital—provided that the factory is established in a district where, through lack of

* See this *Journal*, July, 1918, p. 452.

organisation, the milk produced has not previously been available for human consumption. A proportion of the capital can be borrowed on the basis of 6 per cent. interest, and is repayable in a definite term of years.

The work of organising depots under this scheme was placed with the Agricultural Organisation Society, under the direction of a joint committee made up of representatives of the Board of Agriculture and the Agricultural Organisation Society. The difficulties encountered in obtaining the necessary plant were very great, but in spite of this eight new depots have been established and others are in process of formation.

Influence of Co-operation in increasing Milk and Cheese Production.—One of the most important results attending the formation of co-operative cheese schools and factories has been the increase of milk production in those districts where such schools or factories have been established. The following table shows the results in this direction in various districts :—

Name : *Sturminster Newton*, Dorset. Year established, 1911.

	1911.	1915.
No. of suppliers ..	97	111
Total milk supplied ..	530,605 gal.	1,340,682 gal.

Name : *Vale of Towy*, Llandilo, S. Wales. Year established, 1912.

	1913.	1916.
No. of suppliers ..	*79	27
Total milk supplied ..	115,607 gal.	109,355 gal.

* The cause for the decrease in the number of milk suppliers was due to restriction of area.

Name : *Llangerniew*, nr. Abergele. Year established, 1917.

	1917.	1918.
No. of suppliers ..	24	26
Total milk supplied ..	20,702 gal.	38,000 gal.

Not only does the total amount of milk supplied to a factory increase, but owing to the satisfactory financial returns, the members of a society increase the number of cows kept. The following figures relate to the increase in the herds of six of the members of the Llangerniew Society :—

Farmer's Number.				No. of Cows kept.	No. of Cows kept.
				1917.	1918.
1	5	11
2	14	25
3	2	3
4	8	14
5	3	5
6	5	10
Totals				37	68

The following particulars of the work done by the nine co-operative cheese schools during 1917 will serve to show what was accomplished.

<i>Society.</i>	<i>Milk Received.</i>	<i>Cheese Sold.</i>	<i>Value.</i>		
			<i>£</i>	<i>s.</i>	<i>d.</i>
Camelford	30,309 gal.	32,000 lb.	2,018	11	10
Wall, Gwinear	33,693 "	35,300 "	2,203	8	7
Plas Du, Chwillog	12,117 "	14,368 "	891	17	10
Haslington, Crewe	9,388½ "	10,470 "	627	18	10

Wellington, Hereford	22,925 "	23,660 "	1,266	16	5
Bridge Sollers, Hereford	7,941½ "	8,074 "	535	15	11
Redlynch, Wilts	10,056½ "	10,441½ "	620	0	0
<hr/>					
Totals..	157,520½ "	168,341½ "	10,186	8	8

In addition, 85 pupils received instruction in cheese-making on factory lines, some of whom found employment as cheese-makers in their own districts, whilst others went to factories that were opened up in other districts.

The establishment of these schools and factories has opened up a new industry in districts where hitherto the farmer has been obliged to continue butter-making—although he knew perfectly well that it was an uneconomical proposition—through the lack of facilities for cheese-making. The co-operative milk depot or cheese factory provides these facilities with a minimum of risk and a maximum of convenience to the farmer.

Persons interested in the extension of this development should write to the Board of Agriculture and Fisheries, 3, St. James's Square, London, S.W. 1, for Leaflets Nos. 75, 325, and A. 303/1, which will be supplied free of charge.

REPORT ON THE WORKING OF A CO-OPERATIVE CHEESE SCHOOL.

THE following report on the first co-operative cheese school held in Berkshire, namely, at Marlston, near Newbury, is an illustration of the beneficial results of co-operation.

The school was started primarily to demonstrate that cheese-making, on a co-operative basis, is a sound business undertaking; and, incidentally, to assist in the conservation of the national food supply.

The purposes of the school appear to have been attained in that (1) the moneys realised by the sale of cheese admitted of a satisfactory price per gallon being paid for milk supplied during the season; (2) milk, of which a large part was produced in the surplus season, was converted into cheese; (3) whey, a cheap pig food, was rendered available; and (4) a supply of cheese was made available to each supplier for the use of himself and his employees.

The school opened on 19th May, 1918, and closed on 30th September, 1918, thus working 19 weeks. In all, 12 farmers supplied milk, the total quantity being 228,092 lb. (22,145 gal.). The amount of milk received on the opening day was 1,158½ lb., and on the closing day, 1,456 lb. The highest quantity supplied on any one day was 2,448½ lb. and the lowest 920 lb., the average daily quantity being 1,627 lb.

The variety of cheese made was chiefly Cheddar, but a few Cheshires were also produced. From the 22,145 gal. of milk received, 22,932 lb. of cheese, weighed on the day of sale, were produced. Thus, taking an average over the whole period (19 weeks), one gal. of milk yielded 1·035 lb. of cheese. The cheese was sold for £1,879 7s. 3d.

The yield of whey was 18,173 gal., equivalent in amount to 82 per cent. of the milk received. The milk suppliers who took their quota of whey paid ½d. per gal. up to the week ending 6th July, after which the price was raised to 1d. This is not a high price, when it is remembered that 12 lb. of whey (1½ gal.) are equivalent for the purposes of pork production to 1 lb. of barley meal, and it is clearly reasonable, therefore, to claim that co-operators received an advantage in the matter of whey supplies.

In the matter of remunerating the supplier for milk delivered, the practice followed was that each contributor was entitled to a share of the proceeds (after deducting working expenses) bearing a strict relationship to the proportion of the milk supply contributed by him, and the quality of his contribution. This amounted to paying him in two instalments, the first instalment being about two-thirds of the amount he expected eventually to realise, the actual amount being based on the quantity and quality of the supply. The system adopted was that for each 100 lb. of milk containing 3·5 per cent. of fat he received 100*d.*, and for each increase or decrease of 0·1 per cent. of fat in the milk, above or below 3·5 per cent. 2*d.* was added or deducted respectively.

At the close of the season, after the cheese had been sold, and the full working expenses ascertained, the balance of receipts over the expenditure became available for the payment of the second and final instalment to the milk suppliers, this balance being divided out amongst the contributors, again in proportion to the quantity and quality of the milk supplied by them.

The object of paying for milk on a quality basis is to encourage farmers to produce sound milk of maximum quality, as such milk is not only more valuable from the consumers' point of view, but also produces a higher yield of cheese. Thus, while 100 gal. of milk containing 3·5 per cent. of fat will produce approximately 95 lb. of cheese, the same amount of milk containing 3·7 per cent. of fat will yield approximately 100 lb. of cured cheese. Moreover, in the matter of co-operation, this system compensates the high-quality milk producer and penalises the low-quality producer, which, it must be agreed, is an equitable arrangement.

It must naturally be understood that the amounts which the various contributors received per gal. under the scheme varied, but the average price realised was 1*s.* 8*d.* per gal. This figure is, however, rather more than it would have been had the undertaking been a purely business concern instead of a school, in that certain expenses which would have arisen in ordinary circumstances did not occur. For instance, certain of the apparatus was loaned, and there was no charge for use of buildings and for secretarial services.

The following attempt is made, therefore, to arrive at a balance sheet truly representative of a purely commercial undertaking of the kind. In this balance sheet the cost of the milk is taken as being the price allowed to the producer under the Order of the Ministry of Food, namely :—

			£	s.	d.
19th May to 9th June	3,264.5 gal. at 1s.	..	163	4	6
10th June to 30th June	3,734	.. 1s. 4d.	248	18	8
1st July to 31st July	5,028	.. 1s. 6d.	377	2	0
1st Aug. to 31st Aug.	5,601	.. 1s. 7d.	443	8	3
1st Sept. to 30th Sept.	4,517.5	.. 1s. 7d.	357	12	8
	<u>22,145.0</u>	Total	£1,590	6	1
Equal to an average of 17.23d. per gal.					
Receipts.			Payments.		
	£	s. d.		£	s. d.
Cheese (actual) ..	1,879	7 3	Cost of milk used at current controlled prices	1,590	6 1
Whey (actual) ..	63	3 7	Trade expenses—	£	s. d.
Sundry small receipts (actual)	1	1 6	Rennet ..	13	3 0
			Bandaging	20	15 1
			Salt, soda, etc. ..	4	1 0
			Sundries ..	1	17 7
			Chemicals	1	16 1
			(actual)	41	12 9
			Fuel and light (actual) ..	7	4 0
			Wages—		
			Instructress	50	0 0
			Assistant ..	26	8 8
			(actual)	76	8 8
			Rent, Rates, Taxes ..	4	16 7
			Insurance	1	2 6
			(estimated)	5	19 1
			Miscellaneous Expenses (actual) ..	6	17 7
			Depreciation on utensils purchased by the Committee and supplied by the Board (estimated) ..	9	0 0
			Gross Profits ..	206	4 2
	<u>£1,943</u>	<u>12 4</u>		<u>£1,943</u>	<u>12 4</u>

If this gross profit arrived at in the above balance sheet is divided by the number of gallons of milk handled the undertaking may be said to have returned 1s. 7½d. for each gallon of milk used. It must be remembered, however, that the profit being gross makes no allowance for interest on capital and general commercial risks, or for the yield of cheese being slightly higher than usual in consequence of sales being effected when the cheese was only three weeks old.

SUCCESSFUL DAIRY SOCIETIES.

IAN CALTHROP.

Dairy Organiser, Agricultural Organisation Society.

WHAT is a "successful" dairy society? Do we mean success from a purely commercial standpoint, or an increase in supplies from an area, or the mere existence of a large society with possibly a scattered membership? It is preferable to take a wider view, and claim as most "successful" the society working on strictly co-operative lines, with a membership comprising the bulk of the farmers in the district, and obtaining an increased milk supply from within that district.

Co-operative dairy societies claim to be performing on behalf of the State a duty both to the producer and the consumer. By increasing supplies, guaranteeing quality, preventing risk of souring, and encouraging direct sales from the organised producer to the organised retailer the societies are providing for the State a channel through which eventually may be drawn all the milk supplies of the nation.

We are as yet only at the commencement of the organisation of the dairying industry. It must not be forgotten that the despatch of milk by rail from the producing to the consuming areas was almost unheard of before 1870.

Unfortunately for both consumer and producer the control of the industry, owing to lack of foresight and effort on the farmers' part, passed almost immediately out of the possession of either party. The financier—a man without special interest either in production or the cost of living—stepped in and secured the control of prices at both ends. His main object, the keeping of consumer and producer apart, was frustrated by reason of his constant endeavour to obtain high returns on the share capital he invested. Gradually, the profits he obtained became known; and in increasing numbers the farmers started to try and do business, without the intervention of unnecessary people, between themselves and their customers. In some districts the wholesalers had, by means of a system of collection and provision of churns, secured an absolute monopoly; and the farmers were practically in the position of having no alternative market for their milk.

The work of the Agricultural Organisation Society in promoting the formation of farmers' co-operative dairy societies was slow to materialise; but the number of societies has

gradually increased, and the success of those formed has been remarkable. Fifty-eight societies, representing a turnover of about £3,000,000 per annum, are now engaged in handling milk.

As a similar type of work is done by most of these societies, and almost similar results are achieved in many places, perhaps the best plan is to describe a few of them, and suggest that those who are interested should go and see any one of these societies for themselves.

Amongst the most successful of the societies affiliated to the Agricultural Organisation Society may be mentioned the Wiltshire Farmers, Ltd., which has a turnover in milk alone of over a quarter of a million a year. The society has a finely equipped depot at Chippenham, at which the members' supplies are received. The milk is passed through cleansers and pasteurised, and is then cooled and despatched. The society, by means of an efficient system, has practically eliminated all wastage due to souring. Whereas the ordinary wastage throughout the country is about 1 per cent., the loss in the case of milk sold by the Wilts Farmers has been reduced to .0004 per cent. The society has a membership of 1,200.

Another society, the Eastern Counties Dairy Farmers' Co-operative Society, Ltd., has a large depot in London, from which it regulates supplies. This society has a wonderful record as regards benefits both to producers and consumers. It has always paid a high price to the producer; and it has built up a large direct trade with the organised consumer. It now proposes also to retail milk.

The Ashbourne Milk Producers, formed only a year ago under the leadership of Captain Fitz-Herbert Wright, has been an immediate success. The milk is dealt with at depots situated around Ashbourne in such a manner that every farmer is within five miles of a depot. Milk is collected by means of the society's lorries, every member being thus saved the heavy expense of taking his milk considerable distances to a railway station. The advantage of this is obvious to those who know how hilly is the Peak district of Derbyshire. A large direct trade is done with industrial co-operative societies—a form of business which the society endeavours to encourage.

The special Board of Agriculture scheme for promoting the use for human consumption as "whole milk," of milk supplies which had previously been used for butter-making and calf-rearing on the farms, has led to a considerable increase in the milk resources of the country. The farmers, more especially

in Wales, have taken up the matter with great energy. Finding in the societies a ready market for all the milk they can supply, they have materially increased their herds; in some districts it is claimed that these have been doubled! The West Wales Society, which has taken in milk at three depots and has lately opened a fourth depot, is a case in point. Similar but smaller societies exist at Llangerniew and Chwilog.

Another illustration of the manner in which a co-operative dairy tends to increase production is found in the Brailsford Dairy Society. Wherever milk is dealt with through a depot, the question of the conversion of some portion of the supplies into cheese has at some period of the year to be considered. In normal times the Brailsford Society, which has a membership of about 50 farmers, makes a considerable amount of cheese, the by-products being returned to the members. It is stated that the starting of the society means that one small district has increased the value of the pig population by some thousands of pounds. Some societies skim the whey, the by-product mentioned, before handing it over to the farmer. One such society, the Croxden Association (one of the oldest in England), sells large quantities of whey butter every year.

The Wensleydale Pure Milk Society, as its name implies, makes a speciality of supplying milk of the very highest quality to certain towns in the North of England. The cows of the members are all tuberculin tested; and conditions as to feeding, milking, etc., are imposed to guarantee the production of milk of the very highest quality.

CO-OPERATIVE FARMERS: SOME PROSPEROUS SOCIETIES.

Supplied by the Agricultural Organisation Society.

"I AM more afraid of the vested prejudices than of the vested interests" said the Premier the other day; and the earlier advocates of economic combination among British farmers must often have had a similar feeling. Only quite recently, since the movement has attained a certain strength, have the vested interests begun to make their voice heard; the vested prejudice has given considerable trouble from the start. It was a formidable obstacle; and we are only now seeing it disappear under the action of that mightiest of solvents, experience.

There is an old English adage which contains a lot of wisdom, that an ounce of fact is worth a ton of theory. The farmers' co-operative movement in England and Wales is full of facts, and anyone can readily investigate them. Those who are interested should enquire at first hand, and visit the societies which embody and are carrying out the gospel of agricultural organisation.

Twenty-five years ago the British farmer had to be invited to look abroad if he would judge adequately the benefits which combination for business purposes might have for him ; and he did not usually care to look abroad. It is anomalous that he should have had to do so for as long as he did, and that even now the Selborne Report should have to lament that farmers' co-operation in England and Wales is far less advanced than in most other civilised countries and all our great Dominions. Yet agricultural combination was born in these islands ; and in Ireland it has achieved extraordinarily widespread results. In England and Wales the movement has progressed more slowly, but no less surely ; and in less than 20 years from the start of the Agricultural Organisation Society this body has become the centre of a network of affiliated societies with a turnover of £8,000,000 annually, and a membership of about 130,000.

The prestige of the movement and its direct and indirect influence on agricultural thought have both grown most strikingly in the past five years ; and despite the difficulties created by shortage of supplies and other adverse conditions of the war period, the majority of the societies were never in a more prosperous and active state.

Within the limits of a comparatively short article it is impossible to do more than indicate in brief paragraphs the nature and position of a few typical societies ; but it should be emphasised that similar societies are scattered almost all over the country, and that the Agricultural Organisation Society will be happy to put farmers desirous of joining a society into touch with one or help them to start a local society.

Let us make a brief inspection of two typical though varied agricultural areas—those covered respectively by the North-Western Branch of the Agricultural Organisation Society (Lancs., Cheshire, Cumberland and Westmorland) and those within the Southern Branch (Wilts, Hants and Dorset). It is not suggested that the whole country is covered by societies as large or successful as the best of the societies in these areas ; if it were, the turnover of the farmers' co-operative movement

in England and Wales would be eighty millions sterling annually instead of eight millions, and the membership of the movement, including farmers, smallholders, market gardeners, and allotment men, would be very near the million mark. By quoting these societies as instances of prosperous co-operative effort we seek to establish (1) that there is nothing in English or Welsh farming conditions necessarily opposed to the idea of co-operative combination ; (2) that farmers here can combine as beneficially as in Denmark or New Zealand ; and (3) that the principles expounded by the Agricultural Organisation Society are of universal application though it may be desirable to apply them on slightly different lines to suit the needs of particular neighbourhoods or forms of farming.

Mutual aid has proved beneficial in half the counties of England and Wales ; and there is no reason why a movement which has brought the great advantages of real independence and enhanced stability, as well as economy of working and larger profits, to the farmers of Lancs. and Wilts should not confer equal benefits on the farmers, say of Northants and Lincolnshire.

The Preston and District Farmers' Trading Society, Ltd., is well-known among co-operative farmers as typical of the Agricultural Organisation Society movement at its best. The Agricultural Organisation Society has published a booklet on the history and work of this society ; and every farmer who thinks of linking up with the movement—or has doubts about its value to the agricultural community—should read this booklet. It is a romance of co-operative development. Over £40,000 of the farmers' own capital is invested in this society, the membership of which has risen rapidly to nearly 1,000 last year (it was 208 in 1911). The last returns show sales of upwards of £360,000 per annum, the dividend being only 3d. in the £ ! This concern now has mills or depots at 13 centres. It is especially worth the attention of all students of the movement as a well-managed, progressive society, which combines in a high degree co-operative idealism and shrewd business acumen.

The Manchester and District Farmers' Co-operative Association is a society, formed more recently, which has grown up quickly and now occupies an important place in South Lancashire farming. Registered only in 1913, it has already over 500 members ; and last year it sold upwards of £76,000 worth of goods. Lately, it has bought an important mill at Warrington.

The Mid-Cheshire Farmers' Co-operative Society dates back to 1905 ; its expansion, however, has taken place most markedly in more recent years. Last year it had 418 members, and the sales were £62,840.

If examples are desired of societies established for a longer time and still going strongly—indeed more strongly than ever—the North-Western Branch area can supply several notable instances.

The Cheshire, Shropshire and North Wales Farmers' Supply Association, Ltd., is a case in point. The story of this remarkable society is told in the December issue of the *Agricultural Organisation Society's Notes and News* : it is a story of early struggle and eventual triumph over difficulties. The society was one of the pioneer farmers' organisations in the country, dating back to 1871. It has had only four chairmen and two managers since the beginning. In 1913, convinced of the necessity of building up a national co-operative farmers' movement, the old society affiliated to the Agricultural Organisation Society. Its success has been progressive. To-day it has 783 members, a turnover of close on a quarter of a million pounds annually (with capital of less than £20,000), and growing property and reserves. Since 1871 this society has returned to its members in bonus over £39,000 !

In this same branch area the Furness and South Cumberland Supply Association, Ltd., was formed in 1880. It joined the Agricultural Organisation Society as lately as 1917 with a view to helping to consolidate the movement and because its management believed that the society would be helped by union with other similar societies. The Furness Association has had a chequered career ; but it is now in a strong position with 384 members and a turnover of £37,696.

Another North Western society of note is the Lunesdale Farmers' Co-operative Creamery, at Barbon, which was registered in 1914 and only commenced work in 1915. It has 164 members and sold £25,412 worth of goods last year. Its establishment has enabled many small hill farmers to market their milk who were not in a position to do so previously ; and, already well-founded, the Lunesdale Farmers' is assured of an increasing prosperity.

Turning from North to South, we find equally good evidence of co-operative progress among farmers. At the present time successful examples of practically every form of co-operative activity may be found within the Southern Branch area of the Agricultural Organisation Society.

It is commonly said that co-operation offers no advantages or benefits to the large farmer, but the large farmers of Hampshire and the adjacent counties as long ago as 1907 decided that it was to their interests to combine, with the result that the Southern Counties Agricultural Trading Society was formed with headquarters at Winchester. The society started in a small way and had an uphill battle in the early days ; but by the end of 1917 it had a membership of 546 (including several smaller societies), and its turnover had reached £540,856. The paid-up capital was only £2,726—and the net profit £10,000. All classes of agricultural trade are catered for ; and there are separate departments dealing with the sale of requirements (*e.g.*, feeding stuffs, manure, seeds, etc.), the sale and hire of implements and machinery (including tractors), the sale of live and dead stock by auction, and the sale of eggs, poultry and corn.

The society has ample storage at Winchester and Southampton and supplies goods in hundredweights or truck loads. The auction department was started to bring down the commission charges of the local auctioneers, in which it was successful. Representatives attend the principal markets, and the society employs a skilled manager, machinery expert, and auctioneer.

The Wimborne and District Agricultural Co-operative Society affords a good example of a society catering for the smallholders and small farmers—in addition to the large. This society started operations in 1916—to supply feeding stuffs, etc., for the smallholders and other farmers in the Wimborne district. Stores were secured in Wimborne, where large and small purchases could be made ; and shortly after steps were taken to start a market for the sale of members' produce in Bournemouth. At the end of 1917, there were 263 members holding £979 in shares, and the turnover for the year amounted to £20,000—including the commission earned by the market. Recently, the auction department has been handed over to the County Fruit and Vegetable Society. Great benefits have resulted from the activities of the society.

Another form of produce, the handling of which affords testimony to the benefit of co-operative methods, is milk ; and a brief description may be given of the Sturminster Newton and District Farmers' Society. In 1910 the dairy farmers of North Dorset were dissatisfied with the prices they were getting for their produce from the local buyers, and determined to erect their own factory. A great many difficulties had to be over-

come, and for some time the society was severely handicapped by insufficient capital and supplies. A fully-equipped factory was built at Sturminster Newton, and although no profits were made for the first few years, prices were at once raised in the district. By 1917, however, the society was firmly established, with a membership of 262, of whom 199 sent milk to the depot. The turnover was £109,800. During the year 1,534,000 gal. were dealt with, 72,375 being made into cheese. Recently, another depot was taken over at Fortmell Magna, and a new one built at Gillingham. The society already does a small trade in feeding stuffs, which it hopes to develop in the near future. A large amount of the milk is collected from the members' farms by motor lorries, which are a great convenience. The activities of the depot have undoubtedly encouraged production in the district.

In the past—in many districts—farmers have been seriously inconvenienced by having to wait for privately owned thrashing and ploughing sets to come round. This state of things was aggravated by the War, with the result that the farmers of Hayling Island and the Isle of Wight decided to purchase and hire out their own tackle. Societies were formed in each place. In Hayling Island a steam engine and thrashing machine were purchased; in the Isle of Wight an engine and plough and cultivator. In each case the benefits have been very considerable. The work has been done early and when the farmers wanted it, and the charges have been much less than those of private contractors.

Before the War poultry keepers were in a great many cases dependent on the local market or higglers for disposing of their eggs and poultry, both of which frequently gave very poor returns. This resulted in poultry-keepers combining to sell their produce. As long ago as 1905 the poultry-keepers of West Dorset formed themselves into a society for the purpose of testing and grading eggs, and sending them away to the best market. From very small beginnings the Beaminster and District Collecting Depot has grown into a thoroughly sound concern. In 1917 there were 106 members—over £3,000 worth of eggs and poultry was sold—and in addition to paying interest on capital and full market prices throughout the year, the society was able to pay a bonus of 5 per cent. on all eggs and poultry sent in.

From the foregoing fragmentary notes on a few of the hundreds of flourishing societies affiliated to the Agricultural Organisation

Society it will be seen that there is a *prima facie* case for enquiry by the farmer who has the progress of his class sincerely at heart, and who at the same time wishes to conduct his own buying and selling on the most up-to-date and economical lines.

THE termination of hostilities may be expected to ease the fertiliser situation in all directions, and the farmer may reasonably hope for better supplies in the forthcoming season than in the past. In particular, a certain quantity of nitrate of soda should soon be available and, although this substance is not needed at the moment, it is very valuable in spring time.

Notes on Manures for January, 1919:
From the Rothamsted Experimental Station.

Basic Slag.—This is the season when the phosphatic requirements of grass land should be carefully worked out. It may be presumed that grazing land on heavy soil is likely to respond to basic slag: in many cases there will be available actual personal knowledge or direct experimental evidence obtained in similar circumstances. If not, it is desirable to enquire from the county expert whether or not slag would be likely to give a good return. If the land has already been slagged a repetition may be desirable after four or five years: if it has never been slagged a first application may well be overdue.

At Cockle Park satisfactory increases have been obtained from a first dressing of 10 cwt. of slag per acre, followed every third year by a dressing of 5 cwt. per acre. In the same experiment it was shown how much depends on the method of grazing, better results being obtained with sheep and cattle grazing together than with sheep alone. Thus, on the occasion of a recent visit to Hanging Leaves pasture field where mixed grazing is adopted, it was seen that the grass was well eaten down without leaving dry useless stalks that stock would not touch. On Tree field, however, where sheep only are grazed, the grass was not nearly so well eaten down, there being a good deal of stalky material not taken by the animals.

Another point well brought out in these experiments is the

remarkable way in which slag gets rid of the coarse tussocky grass known as *Aira caespitosa* (identified by the ease with which the leaves cut one's fingers). After a dressing of slag finer grasses and clovers were observed to be coming up through the tussocks: in order to get at these the animals had started tearing the tussocks to pieces. In cases where slag can be obtained and is to be applied, there is something to be said for putting it on as early as possible, though not when the ground is covered with snow.

Perhaps the most important lesson from Cockle Park at the present juncture is that a good dressing of slag to the pasture is more profitable than the feeding of cake to the animals. Perhaps nothing in the whole realm of agriculture has been more frequently repeated in recent years than this, and yet so important is the result that it may well be re-stated. From this season's Report the following figures are extracted:—

Live Weight Increases in lb. per acre, over those on unmanured plot.

Mixed Grazing, Cattle and Sheep, Hanging Leaves Field.

	Plot 1. Basic Slag 10 cwt. 1903, 5 cwt. 1906, and every 3rd year thereafter.		Plot 2. Cake (3 cwt. Indian Cotton Cake annually per head) and Slag as Plot 1.		Plot 3. Cake alone (slag in 1903 only).		Plot 4. Basic Slag and Fish Meal.	
	Cattle. lb.	Sheep. lb.	Cattle. lb.	Sheep. lb.	Cattle. lb.	Sheep. lb.	Cattle. lb.	Sheep. lb.

Lime for Infertile Patches in Fields.—A number of cases of infertile patches in fields where certain crops persistently failed

have recently been brought to the notice of the Rothamsted Experimental Station. In many of these cases the trouble has been due to lack of lime. Two instances may be given. In the first lucerne was grown: it succeeded over part of the field, but failed in patches. Examination of the soil gave the following results:—

	<i>Acidity Test.</i>	<i>Percentage of Calcium Carbonate in Soil.</i>
Places where Lucerne failed ..	Acid	0.008
Places where Lucerne succeeded ..	Neutral	0.02

Here the lucerne succeeded on those parts of the field that were neutral, but it failed on the acid patches, and no amount of re-seeding or care in cultivation would keep it alive. The whole field is short of lime and very near danger point, but the barren patches have actually passed the danger point.

In the second case the crop was barley, and there again it succeeded over parts of the field, but failed in patches.

The analytical results of the soil were as follows:—

	<i>Acidity Test.</i>	<i>Percentage of Calcium Carbonate in Soil.</i>
Places where Barley failed ..	Acid	Nil.
Places where Barley succeeded ..	Neutral	0.016

Again, the barrenness is due to acidity, and can be remedied only by lime. Again also it may be said of the whole field that a dressing of lime would be a wise measure, and would certainly avoid future trouble.

So many cases have been met with where lime is needed that farmers are strongly urged to go into this matter as soon as possible.

Magnesian Limestone as a Source of Lime: Is it Safe?—Recently the use of magnesian limestone as a source of lime has been again discussed. In old days it was rather avoided by farmers, actual harm having been said to result from its use. Thus the Newcastle Farmers' Club allows no compensation for lime derived from magnesian limestone, though allowing it on an 8-years basis for ordinary lime. It cannot be said that there is much evidence of harm, although so persistent a charge can hardly be without foundation. So far as can be gathered, lime from magnesian limestone appears to answer satisfactorily on heavy soils, but is liable to cause trouble on light soils. More experimental work would be needed before a definite rule could be laid down, but for the present this distinction is probably sufficiently correct to afford working guidance to farmers.

Waste Lime.—Wherever waste lime can be obtained, it should be carefully considered by the farmer. Recent tests have shown that the residues from calcium carbide used to generate acetylene are perfectly safe for application, and constitute a useful source of lime to allotment holders and small consumers.* Those who can secure them will be well advised to do so. In the fresh state the lime is distinctly wet, but the excess of liquor rapidly drains away and the lime becomes more or less friable. It may be applied to allotment land at the rate of $\frac{1}{2}$ cwt. per rod now, or within the next few weeks, and left exposed to rain or any frost that may come: later on, when it is broken up, it may be worked into the soil. If sufficient waste lime from any source is available for the farm it may be used in similar manner—put on at once, left to disintegrate in winter, and harrowed in in spring. A farmer purchasing waste lime, however, should always do so on analysis, as otherwise he may be paying more than would be asked for an equal quantity of fresh lime.

Are Dissolved Bones Worth Buying?—With the return of peace conditions this problem will again be before the agriculturist. Many farmers maintain a distinct preference for dissolved bones and are willing to pay more for them than for superphosphate. It is difficult to determine why this should be, as no experimental evidence exists to show any superiority worth paying for. In the Cockle Park tests dissolved bones have not come out as well as basic slag:—

	<i>Dissolved Bones.</i>	<i>Basic Slag.</i>
Yield of hay, cwt. per acre ..	23 $\frac{1}{2}$	40
Live weight increase in sheep over unmanured pasture, lb. per acre ..	59	81.4
Average annual gain per acre ..	8s. 11d.	24s.

At Saxmundham poor meadow land has been manured with various phosphates, but again the bones have come out least effective:—

	Average Weight of Hay : cwt. per acre.	Total Cost of Treatment (12 years)	Net Profit due to Use of Manure for 11 years.
		£ s. d.	£ s. d.
Dissolved bones, 6 cwt., 1901 ..	24	5 0 0	13 4 10
Superphosphate, 7 cwt. ..	25	3 10 0	18 2 6
Basic slag, 10 cwt. ..	28	3 2 6	22 15 0
Unmanured	9 $\frac{1}{2}$	—	—

* See also p. 1131.

The superphosphate and slag were each applied in 1901, 1907 and 1912.

At the Somerset centres the results of the manuring of swedes were :—

				<i>Per Acre.</i>	
				<i>Tons.</i>	<i>Cwt.</i>
Dissolved bones (5 cwt.)	22	13½
Superphosphate (5 cwt.)	23	5½
Bone meal (5 cwt.)	21	1½
Steamed bone flour (5 cwt.)	21	9½

These results do not show any superiority of dissolved bones over superphosphate, and in view of its higher price, farmers may well ask whether it is worth while buying them where superphosphate or slag can be obtained instead.

THE results for 1917-18 of the working of the Scheme of the Board of Agriculture and Fisheries for the improvement of the poultry kept in the rural districts of England and Wales by the establishment of a limited number of stations for the distribution of sittings of eggs of pure-bred fowls have been very gratifying.

**Distribution of
Sittings of Eggs to
Small Holders and
Cottagers, 1917-18.***

Testimony as to the value of the scheme has been received from the county officials and station-holders, as well as from many small poultry keepers, for whom the scheme has been primarily drawn up. The period has offered a favourable opportunity for the encouragement of the raising of better stock, as on account of the shortage of poultry foodstuffs many keepers have been obliged to get rid of their less profitable birds and to breed only good quality stock. A large number of poultry keepers has thus come to rely upon the stations for renewing their small stocks.

The Stations.—The encouragement which has been shown to the stations throughout and the inspection exercised over them, as well as the industry shown by the station-holders, have added to their usefulness in assisting in the improvement of the quality of the stock raised. At a number of stations more sittings were applied for than could be supplied, and in many cases the supply was exhausted a few weeks after the commencement of distribution. A large number of station-holders would, in ordinary conditions, have been able to supply

* Particulars of the Scheme were published in this *Journal*, October, 1916, p. 685.

more, however, but were obliged to cease distribution when the quantity required to be distributed in respect of the Grant allotted to them had been disposed of, on account of the low price fixed for the sittings. At a few stations the specified number of sittings was not applied for before 30th April. This seems to have been due to the lack of early publication of the arrangements by some county authorities, and the fear of a lack of sufficient foods and of a scarcity of brooding hens.

Very favourable reports have been received on the results of hatching, and in only a few cases have unfertile eggs been returned. The railway transport of eggs also appears to have been more satisfactory than in previous years.

The numbers of eggs offered to cottagers and smallholders in 1917 and 1918 was 252,000 and 108,000 respectively, and the actual number distributed in the latter year was 105,438.

The highest distribution in proportion to the Grant was made in the following counties :—

				No. of Sittings.	
				No. of Stations. Covered by Grant.	Distributed.
Warwick	2	120	161
Cardigan	1	120	152
Devon	8	480	586½
Denbigh..	3	180	214

Yorkshire, with 25 stations, distributed 1,476 sittings, only 24 short of the maximum covered by the Grant.

Distribution at a majority of the stations would have been greatly exceeded had not the market price of eggs remained higher than usual at the latter part of the season, leaving the station-holders no inducement to supply above the 60 sittings allowed for full premium.

The approximate average market prices throughout the county, and the prices under the Scheme were :—

		1917.		1918.	
		Jan.	April.	Jan.	April.
Market price	..	2 9	1 6	4 6	3 6
Price under scheme	..	2 6	(+6d. carriage).	3 6	(+6d. carriage).

The lowest price wholesale in many of the counties served was reported by station-holders as 4s. per doz., and this only for a brief period.

As the price under the Scheme included charges for boxes, which during 1918 have risen in cost, and taking into account also the general charge of 8d. per sitting in respect of carriage by rail, this left an insufficient margin to allow for the additional work entailed in correspondence, packing and despatch of eggs sent out in small quantities.

The following table shows the breeds offered and the approximate number of pens of each :—

White Wyandotte ..	102	Ancona	7
White Leghorn ..	102	Light Sussex ..	6
R. I. Red ..	35	White Orpington ..	3
Black Leghorn ..	20	Buff Wyandotte, Speckled	
Buff Rock ..	16	Sussex and Black	
Buff Orpington ..	15	Orpington ..	2 each
		Brown Leghorn ..	1

A considerable variation is shown in production. During the period the highest averages per pen of 12 birds per day were as follows :—

9'4	White Wyandotte and White Leghorn.
9'0	Ancona.

while the lowest were :—

2'4	White Leghorn.
2'8	„ „

These records cannot be taken as a sure guide of either the quality or the management of the stock without comparison with the previous records, and no check can be kept upon the figures given, but they afford some indication of the way the work is being carried out.

Distribution from Incubating Stations, 1917-18.—The following figures give the quantities of eggs, chicks and stock birds distributed from incubating stations during the period under review :—

	<i>Chicks.</i>	<i>Eggs for Hatching.</i>	<i>Stock Birds.</i>
Anglesey	1,147	416	157
Lleweni, Denbigh	1,259	456	73
Kernock, Cornwall	912	72	78
Henhull, Cheshire	732	432	56
Total	4,050	1,376	364

Distribution of Day-old Chicks, 1917-18.—The scarcity of broody hens early in the season, due no doubt to the fact that better, and consequently less broody, laying-stock are kept, and also to the fact that a large percentage of the breeds now kept are of non-sitting variety, led to a greatly increased demand for day-old chicks, and by the middle of the season applications for four times the quantity arranged for had been received at the Harper-Adams College. The number of applications at the other three centres was not notified, but in all cases large numbers of orders had to be returned.

The following figures give the number of stations in existence in 1918, and the number of chickens offered (covered by Grant) and distributed during the year :—

<i>Stations.</i>	<i>Chicks Offered.</i>	<i>Distributed.</i>
4	3,360	3,937

NUMBER OF EGGS SUPPLIED TO COTTAGERS AND SMALL-
HOLDERS UNDER THE BOARD'S EGG DISTRIBUTION SCHEME,
1917-18.

SPEAKING at the inaugural meeting of the Chamber of Horticulture at the Caxton Hall, Westminster, on 2nd December, the Right Hon. R. E. Prothero, *President of the Board of Agriculture*, said it was not the big man, but the small men who could not help themselves who were going to benefit by such a Chamber. There were three special points to which he thought they might give their attention. (1) The first was the question of *horticultural research*. The history of the world and of the War had shown that, though we were bad starters, we were good finishers. We had undoubtedly lagged behind other nations in scientific research in fruit growing, but the Board of Agriculture hoped that the endowment for research would be increased and developed. If this were so, he did not doubt that research work would be carried to such a pitch as would be a pattern to the whole world. (2) One of the objects of their Chamber would be the *eradication and control of pests*, which had hitherto done enormous damage. (3) Then there was the question of *railway transport*. They must unitedly put forth effort and show a good case for the increase of transport facilities and the alteration of rates.

THE success of soldier-labour on farms during the War is of happy augury in connection with the effort now to be made to place ex-Service men on farm work in this country. If the low category men who alone could be made available for agriculture during the War have proved their worth, how much more valuable to farmers will be the labour of the fine fit men who will shortly be set free from the Forces!

In the early part of 1917 the Army Council agreed to supply, for agricultural work, low category soldiers who were surplus to immediate military requirements. It was arranged that such men should be posted to "Agricultural Companies," specially formed for the purpose and stationed at 43 convenient distribution centres. Each centre was placed under the

command of an officer with agricultural experience, and the distribution of the men to the farms was arranged by the County Agricultural Executive Committees.

The first men went out early in March, 1917, and their numbers have steadily grown until at the present time the agricultural companies contain over 70,000 men, apart from 10,500 other soldiers, who are temporarily attached for seasonal work. There is, therefore, on farm work one soldier to every nine civilian male workers.

From the outset it was recognised that two inherent difficulties had to be faced. First, the majority of the men available had no previous experience of agriculture, and secondly, many of them, having been used to town life, would find the conditions of country life unattractive. Farmers, therefore, had to be encouraged to teach the untrained men and make the best of them. It was also necessary to make the men as comfortable as possible.

As a general rule, both farmers and soldiers quickly adapted themselves to the new conditions. Employers who at first sent back men because of their ignorance of farm work, soon heard from other farmers in the district that the unskilled men were, under patient teaching, rapidly becoming useful farm hands. The County Labour Officers and the Commandants of the Distribution Centres attended markets and farmers' meetings, and persuaded employers who were short of labour to give the men a trial. Farmers were also encouraged to visit the centres and interview the men there. On the other hand, Commandants were quick to "spot" men who were never likely to be satisfactory on farms and these were sent back to their units.

Many thousands of soldiers were taken on by farmers and trained, being paid the local agricultural wage from the commencement. Later on, when the programme for the 1918 harvest was being seriously retarded by reason of the deficiency of ploughmen, it was decided to send out soldiers free of charge for two to three weeks to selected farms to be trained as ploughmen by the farmers' skilled men. The Food Production Department also established some 30 ploughing schools in the neighbourhood of distribution centres, at which unskilled men could be taught to plough. A three weeks' course of tuition proved on the average sufficient, and over 4,000 ploughmen were trained in this way. To the school near Bishopthorpe, York, managed by the West Riding Agricultural Executive Committee, 481 men in all were sent to be trained, and of these,

431 were passed out as ploughmen, only 50 proving to be unsuitable. The majority of the men trained were van-drivers or carters from towns, while others had been farm labourers not accustomed to horses, and many had had no previous experience of farm work or of horse management.

Other schools were established by the Department for the training of soldiers as tractor drivers and ploughmen. The men selected were mainly those who had been used to driving motor cars or had some knowledge of petrol engines. After two weeks' course at the school, followed by two weeks in the field as third man, the men were usually found to be sufficiently proficient to take charge of a tractor. In all, 4,093 soldiers were trained for this work. About 200 soldiers were also sent out for training with steam plough and threshing sets.

Apart from the low category men posted to Agricultural Companies, farmers have received invaluable assistance by the loan of both skilled and unskilled men from the Army for short periods at busy seasons. In the spring of 1917, 18,000 category "A" ploughmen were sent out for two months to assist with spring cultivations. Similarly, 1,500 ploughmen were loaned for three months during the autumn of 1917; and 7,500 such men are on farm furlough at the present time. Reliance has also been placed on soldier labour for the ingathering of the harvests. 17,000 men assisted farmers to secure the harvest of 1917; and 8,500 were sent out this year, in addition to the regular soldier workers. Soldiers from Convalescent Camps and Command Depots have also assisted in harvest work. In both years much laid corn had to be harvested, and hundreds of soldiers were taught to use the scythe or sickle. The plan adopted was to arrange with farmers who had laid crops in the neighbourhood of the centres to allow their corn to be cut by hand by unskilled soldiers working under the supervision of the farmers' skilled men. It was found that men of average intelligence could be taught this work in one or two days.

Latterly, the Agricultural Companies, having reached their full authorised strength, have been reinforced only by soldiers with agricultural experience. The men originally sent out as purely unskilled have settled down as part of the permanent staffs of the farms and in numerous instances are among the farmers' most valued men. Numbers of these men will undoubtedly decide to remain on the land permanently rather than return to their former town occupations. Many will desire to climb the agricultural ladder and attain to holdings of their own.

THE Board have received the following communication from Dr. W. E. Collinge : With reference to the notes on the protection of seed grain from birds at pp. 927 and 1021 of the November issue of the *Journal*, the writer, some years ago, made a large number of experiments on this subject with powdered aloes, alum, creolin, cresylic acid, coal tar, and various waste tar products.

None of these alone gave complete protection, and some certainly retarded germination, particularly the cresylic acid, but the two following mixtures proved exceedingly effective, and are, we think, worthy of being recorded.

1. This consisted of ordinary coal tar melted down and thinned with a mixture of paraffin, and a little liquid soft soap, until the desired consistency was obtained.

2. In the second case, ordinary commercial cresylic acid mixed with an equal part of paraffin formed the thinning material. This was well mixed with the melted coal tar, and then an equal bulk of what is termed at the tar distilleries. "heavy base oil" was added.

This latter mixture dries much quicker than the former one, and proved the more effective of the two.

No adverse effect was noted on the germination of the seed in either case, whilst the seeds were certainly avoided by rooks, starlings, and wood pigeons.

THE Board have received from Mr. W. Brunton, of Tollesby Farm, Marton, Yorkshire, an interesting communication, giving

**Successful Farm
Cropping.**

particulars of the high yields obtained from two years' cropping of a field of 17½ acres. The field was measured for the previous tenant's away-going crop 2 years ago, when it was in oats after "seeds." It had received 10 tons of manure per acre, and the oats were valued to Mr. Brunton at 7 qr. Mr. Brunton manured it again with about the same quantity of farmyard manure and ploughed it in in the autumn. During the winter he gave it 10 cwt. of basic slag, and in the spring (1917) 5 cwt. superphosphate and 2 cwt. bone meal in the rows for swedes, which were only half a crop. This year it was sown with Goldthorpe barley, and gave the high yield of 165 qr. (=76½ bush. per acre) of malting barley + 5 qr. of small barley. Mr. Brunton thinks that the application of basic slag to the turnips increased the yield considerably.

IN accordance with an announcement made at the beginning of the present year, the Food Controller on 1st November took control of the whole potato crop of England and Wales.

State Control of Potatoes. Fixing of Prices and Trading Conditions.*

The prices to be paid to growers have been fixed by a Commission, under the chairmanship of Mr. Rigby Swift, K.C., M.P., appointed by the Food Controller and the President of the Board of Agriculture jointly. The report of this Commission has just been issued.†

The prices per ton, free on rail, during November and December for Grade 1 potatoes ("King Edward," "Golden Wonder," "Langworthy," "What's Wanted," and "Main Crop" varieties) are as follows:—

Sussex	£	s.
Wilts, Hants, Berks, Bucks and Oxford	8	0
Kent, Surrey, Essex, Herts, Beds, Middlesex, Dorset, Somerset, Gloucester, Devon, Cornwall, Suffolk, Lancaster, Cheshire, Monmouth, Wales	7	10
Hereford, Worcester, Warwick, Shropshire, Stafford, Derby, Leicester, Northants, Rutland, Northumberland, Cumberland, Westmorland, Durham	6	15
Nottingham, Yorkshire, and other than black lands in Lincolnshire, Soke of Peterborough, Norfolk, Cambridge, and Hunts	6	10
Black lands in Soke of Peterborough, Lincolnshire and Norfolk	6	0
Black lands in Cambridge and Hunts	5	15

Prices for Grade 2 potatoes (which include all other varieties than those mentioned above) are in all cases 10s. less.

While the prices to producers will thus vary in different areas, the price to the public for the same grade of potato will be uniform throughout England and Wales. Grade 1 potatoes will, until the end of December, be retailed at a uniform price of $1\frac{1}{2}$ d. per lb., and Grade 2 at a uniform price of 1d. per lb. Lower prices will be fixed for large retail sales. In January the retail prices will be raised to $1\frac{1}{2}$ d. per lb. for Grade 2 and $1\frac{3}{4}$ d. per lb. for Grade 1 potatoes.

The potatoes will be supplied to retailers at a uniform price fixed conditionally at £9 per ton for Grade 1 potatoes and at £7 per ton for Grade 2 potatoes; the price being reckoned to the retailer's nearest railway station.

The wholesalers will thus buy from the growers at varying prices, and sell in all cases to retailers at a flat price. In doing so, they will act as agents of the Ministry of Food at a commission which has been fixed, provisionally, at 7s. 6d. per ton, and they will account to the Ministry for the difference between the price paid to the grower and the price obtainable from the retailer after deducting their commission and necessary charges.

Both the retailer's buying price and the wholesaler's commission are subject to revision when further information as to actual costs has been obtained.

Method of Distribution.—For purposes of administration, England and Wales have been divided into eleven deficit zones, which will need

* See also this *Journal*, September, 1918, p. 708.

† See p. 1116.

at some time or other during the year to import potatoes from elsewhere, and twelve surplus zones, which will export potatoes (particularly to London and the other large industrial centres). In each surplus zone is a zonal committee under a zonal chairman, responsible for organising the collection of potatoes for export to other areas. In each deficit zone is a Potato Control Committee under the chairmanship of the Food Commissioner. These committees will be empowered to issue directions relating to the collection and disposal of potatoes—*e.g.*, they may require potatoes of good keeping qualities to be held up until later in the year.*

Subject to any restrictions imposed by the Potato Control Committee or the zonal committee, growers will be permitted to sell potatoes to any registered wholesale dealer in their zone; but they may not sell to anyone else, except under licence to be obtained from the Food Commissioner of their area. Sales under such licences will be made at the appropriate price for the class of sale authorised, but growers of more than five acres will be required, as a condition of obtaining such a licence, to pay a fee so adjusted as to secure that their net receipts are equivalent to the grower's price fixed for their district, together with any sum required to cover the cost of additional cartage and a commission of 2s. 6d. per ton. Growers of less than five acres of potatoes will not, as a rule, be required to pay this fee.

Till the end of December growers may, without licence, sell Grade 2 potatoes grown in the counties of Sussex, Wilts, Hants, Berks, Bucks and Oxford, direct to retailers or consumers within their zone.

Small growers who have cultivated less than one acre of potatoes altogether in 1918 may sell freely without any licences, subject to the maximum price applicable.

A grower selling to a wholesale dealer will be entitled to receive the assessed price within fourteen days, and if he does not do so should apply to the Potato Control Committee or zonal committee of his zone, as the case may be.

No person may deal in potatoes by wholesale unless registered by the Ministry of Food, or by retail unless registered by the Food Control Committee of his district.

Wholesaler's Commission.—As a general rule, only one wholesaler's commission may be charged in respect of any lot of potatoes; and if they pass through the hands of more wholesalers than one the commission must be shared. Special cases will, however, be considered, and an additional collecting dealer's commission, not exceeding 3s. 6d. per ton, may on application for the necessary licence be allowed in cases of proved necessity.

Wholesale dealers will not be allowed to sell potatoes to any person other than registered retailers or wholesalers, unless they hold licences to do so from the Food Commissioner of their area. Such licences will be granted to wholesale dealers who can show that they have a regular trade in supplying potatoes to caterers, fish-friers, institutions, or other large consumers, and will be limited to sales of potatoes to specific customers.

The general system of control and the retail prices fixed under it will come into force on 1st November; but retailers will be allowed,

* The constitution of these committees is authorised by Order No. 1438 of the Food Controller, dated 5th November, 1918 (The Potato Committees Order, 1918).

until and including 9th November, to sell any grade of potatoes at a price not exceeding 1½d. per lb. if it is proved that such potatoes were bought from the grower before 1st November.

A leaflet for the guidance of retailers, giving the zones and the addresses of the committees and Food Commissioners, can be obtained on application to any Food Office. Leaflets for growers and for wholesale dealers can be obtained from the Ministry of Food, or from any Food Commissioner or zonal committee. All applications for licences should be made to the Food Commissioner for the district.

The foregoing summary relates only to ware potatoes. Growers will be free to sell undersized potatoes subject to a maximum price of £3 10s. per ton free on rail. Undersized potatoes for which a market cannot be found in the ordinary way will be taken over by the Ministry of Food at the fixed price of £5 per ton prescribed by the Joint Commission.

A separate Order will be issued dealing with seed potatoes. (*National Food Journal*, 13th November, 1918.)

THE following is the report of the Potatoes (Growers' Prices) Commission, presented to the Food Controller and the President of the Board of Agriculture :—

**Report of the
Potatoes Commission.
Method of Assessment
by Areas.**

We have conceived it to be our duty so to fix the prices that they should be such as would, having due regard to the average cost of production and yield per acre in the different districts, give to the grower a fair profit ; at the same time we have endeavoured to fix such prices as, having regard to all the circumstances of the present time, shall be just to the consumer.

We have devoted one day in each of the fifteen districts selected by your departments to hearing local evidence submitted by representative merchants and growers. Wherever our meetings and itinerary allowed, we have inspected typical potato crops in the areas. Since our return from the country we have heard a number of representative witnesses on matters relating to costs of production, an equitable scale of profits on cost, estimated yields, the incidence of the various potato diseases throughout England and Wales, and other points germane to our inquiry. By the courtesy of the Director-General of the Food Production Department, we have availed ourselves of the services of several of his technical officers, who have lifted samples of growing crops on farms selected by us for the purpose in order that we might check the accuracy of estimated yields given in evidence. Since our labours began on 29th July we have held altogether 31 sittings, have heard 31 assessors, and have examined 102 witnesses.

The evidence laid before us in the areas was, we understand, prepared in the following manner. Before the sittings of the Commission began, a form of schedule of costs of production was prepared at the Food Production Department and settled in consultation with the assessors appointed by the Board of Agriculture. This form, with or without emendations made to suit local methods of calculating costs, was circulated by the Board's assessors to a large number of representative growers and filled in by them. These forms were in turn tabulated by the Board's assessors, who in most cases presented to us, at our local sittings, average costs of production covering a part of a county, a county, or a group of counties constituting an area, and with them an

estimate of the yield. In many cases the assessor appointed by the Ministry of Food presented similar evidence collected from growers, or alternatively made a report based on his own observations and experience with or without consultation with the Board's assessor. In some cases the assessors agreed on an identical cost of production and yield; in others there was a difference, but in no case was it greatly marked.

Costs of Production.—We were everywhere impressed by the general ignorance of growers as to their costs of production. It is obvious that, in the majority of cases, farmers had never before considered the question except in the vaguest way, with the natural result that the most divergent views were expressed on this essential element of our inquiry. We feel sure that the costs as presented to us were on the whole exaggerated, not from any intention to deceive the Commission, but owing to a general tendency to attribute to all potato growers in an area the advanced kind of husbandry exercised only by the most enlightened few. This was clearly demonstrated where, on our instructions, test weighings were made of the crops on the farms taken as representative by the assessors.

We desire to express our gratitude to the assessors for the considerable time and trouble expended by them in an inquiry of a novel and difficult character.

In many cases the assessors and witnesses asked for special consideration for those farmers who had not previously grown potatoes but had cultivated a considerable acreage this year either voluntarily, from patriotic motives, or at the direct request of the County Agricultural Executive Committee. The increase in the area planted has been taken into account by us in fixing the schedules of prices, but any attempt to compensate individual farmers whose crops have been a partial failure owing to unskilled cultivation or similar causes would cause serious hardship to the consumer, and would give excessive profits to the average grower. We are confident that the motives of the farmers concerned were genuinely patriotic, and that the majority will expect no compensation beyond the prices we have fixed, other than the knowledge that they loyally responded to the appeal made by the Government at a time of national crisis.

The Prices.—It will be observed that the prices given in the schedules hereto vary between an average price of £6 3s. 2d. per ton, for ordinary varieties over a 1½-in. riddle for potatoes grown on black land in Cambridgeshire, to £8 18s. 9d. per ton, for "King Edwards" over a 1½-in. riddle for potatoes grown in the county of Sussex.

In accordance with the instruction contained in your Warrant, we have given careful consideration to the proposed classification by the Ministry of Food of ware potatoes into one or more grades for the purpose of retail sale. Our decision that an extra price of 10s. per ton shall be paid to growers in all areas and at all periods throughout the season for potatoes of the varieties "King Edward" and the "Langworthy" group was based on the following reasons:—

(a) The yield per acre of these varieties is on the average markedly less than of the ordinary white varieties.

(b) These varieties in the past have secured a readier sale and better prices than other varieties.

(c) Growers this year have planted these varieties expecting that, as usual, the higher price would at least partly compensate for the lower yield.

We trust that this decision will not be regarded by growers as maintaining a precedent for future years, or as a reason for concentrating their attention on the production of "King Edwards." It may be desirable that a certain proportion of this variety should be grown on account of the excellent keeping qualities of the tubers, and because they can be lifted comparatively early; but we consider that the relatively low yield per acre and the liability to disease make the extensive cultivation of the variety undesirable, except on certain classes of soil. We do not think that any encouragement to the growing of "King Edwards" should be derived from the fact that we have, in the circumstances prevailing this year, fixed a higher price for them.

It will be observed that there is a variation as between different areas in the size of the riddle over which ware shall be sold. Practically unanimous evidence was laid before us that the use of southern "seed" is neither usual nor desirable, and the dressing of ware over a $1\frac{1}{2}$ -in. riddle in these areas will have the twofold result of yielding a larger proportion of the crop for human consumption in areas which normally import a substantial part of their supplies, and of preventing the planting in 1919 of unsuitable "seed." Moreover, we have evidence that in many of these areas it has been the practice to sort the potatoes by hand, instead of dressing them over a riddle, and that such ware normally corresponded with samples dressed over a riddle with a smaller mesh than $1\frac{1}{2}$ -in.—(*National Food Journal*, 13th November, 1918.)

Footnote 1, to Schedule of Grade I. Potatoes on p. III9:—

The increments fixed above must be accepted as covering compensation to the grower for wastage and loss in pits, and for deferred delivery. Price, weight and condition are to be determined in accordance with the scales set out above as to the date when delivery is taken. No grower is entitled to claim further compensation for any losses, save those which are quite exceptional in character. In such cases it will be the duty of the grower, when making application for compensation, to satisfy the Government that:—

- (1) The site of the pit has been properly chosen;
- (2) The potatoes were in sound condition when pitted; and
- (3) Due care was exercised in constructing the pits and in examining the condition of their contents from time to time.

If the Food Controller should decide to take all ware potatoes over a $1\frac{1}{2}$ in. riddle in all or any of the areas for which a $1\frac{1}{2}$ in. riddle is specified above, the prices for all periods are to be increased by 10s. per ton.

Footnote 2, to Schedule of Grade II. Potatoes on p. III20:—

The increments fixed above must be accepted as covering compensation to the grower for wastage and loss in pits, and for deferred delivery. Price, weight and condition are to be determined in accordance with the scales set out above as at the date when delivery is taken. No grower is entitled to claim further compensation for any losses, save those which are quite exceptional in character. In such cases it will be the duty of the grower, when making application for compensation, to satisfy the Government that:—

- (1) The site of the pit has been properly chosen;
- (2) The potatoes were in sound condition when pitted; and
- (3) Due care was exercised in constructing the pits and in examining the condition of their contents from time to time.

If the Food Controller should decide to take all ware potatoes over a $1\frac{1}{2}$ in. riddle in all or any of the areas for which a $1\frac{1}{2}$ in. riddle is specified in the above schedule, the prices for all periods are to be increased by 10s. per ton.

[*Retailers' buying price for potatoes delivered to the railway station at which potatoes would be delivered to him in the ordinary course of business.*]

Grade I.	£9 per ton.
Grade II.	£7 " "

UNDERSIZED POTATOES.

Maximum price of all undersized potatoes (other than those sold as and for seed and within the meaning of "seed potatoes" as will be defined by Order of the Food Controller):—

Per ton, f.o.r. or f.o.b.	£3 10s.
---------------------------	----	----	----	----	---------

Note.—The Ministry of Food will purchase the undersized potatoes for which the grower cannot find a market at the rate of £3 per ton riddled free from soil, f.o.r. or f.o.b. in all areas and at all periods of the season.

OFFICIAL NOTICES AND CIRCULARS.

N.B.—The Orders which may be mentioned in this section of the JOURNAL may usually be obtained at the price of 1d. each from H.M. Stationery Office, Imperial House, Kingsway, London, W.C. 2, and 28, Abingdon Street, London, S.W. 1; 37, Peter Street, Manchester, and 1, St. Andrew's Crescent, Cardiff.

THE following Circular Letter (No. C. L. 97/C. 1) was addressed to Clerks of County Councils and County Borough Councils in England and Wales by the Food Production Department of the Board on 19th November:—

The Land Drainage

Act, 1918:

Circular Letter.

SIR,—I am directed by the President of the Board of Agriculture and Fisheries to enclose herewith a copy of a leaflet (F.P. No. 56)* summarising briefly the provisions of the Land Drainage Act, 1918.

Owing to a variety of causes, the channels (both natural and artificial) carrying the arterial drainage of agricultural land have in many parts of the country lapsed into such a condition that they are no longer capable of efficiently discharging that function. The experience gained by the Board of Agriculture in the course of carrying out their policy of increased food production, rendered necessary by the pressure of war conditions, has shown that a considerable improvement in arterial drainage is urgently necessary in order that a very large aggregate acreage of potentially good arable and profitable pasture land may not continue to remain derelict or semi-derelict, with a resultant loss of food to the country, and of revenue to the State and to Local Authorities.

The improvements required vary in different districts. Some areas require more or less elaborate schemes involving the expenditure of a considerable amount of money and a large supply of labour, or need the provision of machinery for pumping and other purposes.* These cases could not, for obvious reasons, be dealt with during the progress of the War, but in many other instances it was shown that the application of a relatively small amount of labour, rightly directed, would at once set free a considerable acreage for the production of food, and a great deal of good work has been done in this direction by the Agricultural Executive Committees acting on behalf of the Board under the Defence of the Realm Regulations.

Some substantial time may still elapse before schemes can be undertaken which involve the installation of mechanical appliances on an important scale; but there are many, both small and large, which can be carried out by manual labour, so as to effect very substantial improvements. Mr. Prothero is desirous that every effort should be made to maintain the progress that has already been made and to deal with the larger schemes at the earliest opportunity, and for this purpose it is in many cases, where a considerable area is affected and where an efficient authority is not already in existence, a necessary preliminary to any effective action that some authority having complete control of the drainage should be set up for the area.

The Land Drainage Act, 1918, facilitates the establishment of new drainage authorities and the extension of powers of those already

* Printed in this *Journal*, November, 1918, p. 961.

established, and provides in various other ways a ready means of improving arterial drainage. The Act also makes it possible for County and County Borough Councils to assist very largely in the matter. Thus under Section 1 (2) the powers and duties of existing drainage authorities may be transferred to them on their application; under Section 2 (2) a Council may petition the Board for an Order under the Act and thus initiate proceedings for the benefit of drainage; and provision is made in Section 10 for joint action by two or more councils when this is necessary or desirable. Consultation with the County or County Borough Councils concerned is provided for, before the making of any draft order by the Board. Part II. of the Act, which provides a means of enforcing upon drainage authorities and private persons the carrying out of their duties and liabilities in this matter, enables the Board to deal with the drainage of areas too small or otherwise unsuitable for the establishment of drainage authorities. The powers of the Board of Agriculture under this part of the Act may be delegated to a body of persons, the majority of whom shall be members of the County or County Borough Councils in the area concerned.

I am directed to ask you to be so good as to invite the attention of your Council to this important matter, and I am to express the Board's confidence that the Council will be willing to co-operate with them in utilising the provisions of the new Act for the amelioration of drainage conditions in their area either by actually initiating proceedings themselves or by drawing the Board's attention to any case in which it is considered that beneficial action can be undertaken.

I am, etc.,

(Signed) E. M. KONSTAM,

Director of Land Drainage.

THE War Cabinet have asked the Board of Agriculture to obtain information as to the possibility of carrying out schemes of land reclamation in various parts of the country if

Land Reclamation: supplies of soldier labour should be available for this purpose during the period of demobilisation. The Food Production Department

Schemes for the Demobilisation.

have circularised the Agricultural Committees of the counties on the subject. Of course, the demands of the farmers for labour required on their farms will be fully met before any soldiers are started on reclamation schemes. After the ordinary requirements of the farms have been met it is proposed that any waterlogged areas should first receive attention. Only when both these matters have been dealt with in a satisfactory manner is it intended to take up general reclamation schemes. "It is possible, however," according to the official circular, "that the normal demands of the farms and the treatment of waterlogged areas may not absorb all the labour that will be available, and, if so, it could usefully be employed in reclaiming areas which at present are uncultivated and are producing nothing."

County Committees are asked to furnish at once particulars of any areas exceeding 25 acres at present uncultivated which could be brought into cultivation if labour and funds were available for the purpose. Land which is above 800 feet in altitude should not be included; and any areas which might be reclaimed from the sea should also be reported.

Individuals with knowledge of areas suitable for reclamation may be doing a useful public service by writing to the Food Production

Department, 72, Victoria Street, S.W. 1, giving details. It may be added that during the past two years a considerable number of minor reclamation schemes have been carried out by County Committees or private owners; and that there is no doubt whatever as to the remunerative nature of such enterprises where the area is well chosen and the scheme is intelligently directed and adequately financed. Some fine crops of potatoes grown in England this year were produced by land which as recently as February last was rough heath covered with brushwood.

THE following is a copy of a letter (No. L. 5150/1918) dated 29th November, 1918, which the Board have addressed to the Essex County Council with regard to repayment of expenses

Acquisition of Land for Ex-Service Men: incurred by county councils in relation to the land settlement of ex-Service men :—
Repayment of Expenses to County Councils. SIR,—I am directed by the President of the Board of Agriculture and Fisheries to say that the Board have been informed by Mr. E. O.

Fordham, one of their Small Holdings Commissioners, that at a meeting of the Small Holdings and Allotments Committee of the Essex County Council, held on the 5th instant, to consider the Board's Circular Letter of the 16th September last (A. 313/C.)* relative to the land settlement of ex-Service men, the question was raised as to whether the Board were prepared to repay the County Councils' expenses incurred under the Small Holding Colonies (Amendment) Act, 1918.

I am, therefore, to inform you that subject to compliance with their statutory Regulations of 8th September, 1914, made in pursuance of Section 21 of the Small Holdings and Allotments Act, 1908, the Board will be prepared to repay to your Council the whole of the expenses which, in the opinion of the Board, have been necessarily or reasonably incurred by the Council in proceedings in relation to the acquisition by the Council of land for small holdings provided for the settlement of ex-Service men.

I am, at the same time, to say that all the expenses which may be incurred by your Council in making the enquiries referred to in paragraph 8 of the above Circular will also be refunded to them by the Board.

I am, etc.,

(Signed) E. L. MITCHELL,
For Secretary.

Mr. George Lambert asked the Under-Secretary of State for War on 19th November if he would state what definite arrangements had been made for releasing agricultural labour from the

Agricultural Labour: Army that is urgently needed for the production of next year's crops?

Mr. Macpherson: There are at present over 79,000 men in agricultural companies, and 5,000 ploughmen who are in medical category "A" have just been sent out on two months' furlough. All men at home of any medical category, who are threshers, are now being obtained from the Army. During the harvest 20,000

soldiers were supplied, of whom about 3,000 are still engaged on potato lifting. Any men of low medical category who are experienced farm workers, and are serving at home, are being attached to agricultural companies, and made available for agricultural work.

Mr. Lambert : Assuming there are men of Grade "A" who are really essential for the cultivation of farms, what is the most expeditious method of getting them out of the Army ?

Mr. Macpherson : I am afraid they must come under the demobilisation scheme.

Mr. George Lambert asked on 18th November what arrangements he has made for the release from the Army of the key men for agricultural cultivation and cattle feeding ?

Release of Agricultural

Key Men :

Question in Parliament.

Mr. Prothero : The Board are in consultation with the Ministry of Labour and the War Office on the subject. Though I cannot make any definite statement at the present time, I can assure the right hon. Gentleman that the claims of agriculture will be pressed to the utmost.

Mr. Lambert : Can the right hon. Gentleman say when any of these men will be sent back to their farms ?

Mr. Prothero : I very much hope that some are on their way now

Mr. G. Terrell : Is the right hon. Gentleman pressing the claims of the men who have been recently called up, who are still in this country, and who might be released at once ?

Mr. Prothero : We are getting these men released at once.

Mr. G. Lambert (by Private Notice) asked on 10th November if the President of the Board of Agriculture is able yet to say whether the prices paid to farmers for controlled cereals harvested in 1919 will be not less than those now current ?

Controlled Cereals

(Price):

Question in Parliament.

Mr. Prothero : Yes, Sir ; the answer is in the affirmative.

Mr. Duncan Millar asked the President of the Board of Agriculture on 18th November the number of claims which have been referred to arbitration under the provisions of the Corn

Corn Production

(Amendment) Act

(Claims):

Question in Parliament.

Production (Amendment) Act, 1918, the number of claims which have been settled without being referred to arbitration under the Act, and the total sum paid in settlement of such claims ?

Mr. Prothero : Up to the present no claims for compensation have been referred to arbitration under the Corn Production (Amendment) Act. 158 claims have been settled without reference to arbitration, and lump sum payments amounting to £12,952 5s. 3d. have been made, as well as annual payments in lieu of rent amounting to £2,570 11s. 11d. per annum.

Mr. Tillett asked the Prime Minister on 19th November whether he is aware of the existence of international trusts which operate the world's and home markets in meat, milk, wheat, and other essential foodstuffs with the result of the keeping up of prices to the hurt of the poor ; and whether he proposes to introduce legislation for the purpose of making such trusts illegal ?

Major Astor : I have been asked to reply. The Food Controller is aware that there are certain international combinations operating in foodstuffs as well as other commodities. The Inter-Allied Food Council may be trusted to combat the dangers arising from food combinations abroad, and the hon. Member may rest assured that effective measures will be taken to prevent any rigging of the markets by trade combinations at home.

THE following Notice was issued by the Food Production Department of the Board on 29th November :—

It is found that many holders of allotments under the Cultivation of Lands Orders are still in doubt as to the period for which they hold their plots. In order to make the position clear the Food Production Department issue the following statement on the subject :—

As the result of recent legislation—The Corn Production (Amendment) Act, 1918 (Section 1) and the Defence of the Realm (Acquisition of Land) Act, 1916 (Section 1)—allotment holders under the Cultivation of Lands Orders are now secure in the occupation of their plots until the expiration of two years from the “ termination of the present war ” (which term has to be defined by Parliament) except in those cases where it is shown to the satisfaction of the Board that the land is required earlier for building or other special purposes, or where the compensation payable if the land is retained would be in excess of the value to the nation of the food produced. If, owing to the land being required for one or other of the above-mentioned purposes, any such allottee has to surrender his plot before 1st January, 1920, he will be compensated by the Board of Agriculture for the growing crops, etc.

Powers conferred by the Small Holdings and Allotments Act, 1908, however, provide the means of securing longer periods of possession for those allotment holders under the Cultivation of Lands Order whose land is not required for the purposes already specified. These powers enable Local Allotment Authorities in agreement with owners to take allotment land for long leases.

The Board of Agriculture have asked Local Authorities to take every opportunity of leasing such land ; and in certain districts action in this direction has already been taken.

THE following Notice was issued by the Food Production Department of the Board on 22nd November :—

A rumour appears to be current in various parts of the country to the effect that allotment holders are prohibited from selling the surplus produce of their land unless they have obtained a retailer's licence. The Food Production Department have issued an assurance that this rumour is entirely without foundation. No Order compelling allotment holders to obtain a retailer's licence has

been made by the Ministry of Food; nor does that body propose to make any such Order. Allotment holders are perfectly at liberty to dispose of their produce in any way that they deem advisable.

ACCORDING to a Notice issued by the Food Production Department towards the end of November, a grower in Berkshire who had six acres of land on which he could have planted nothing else this year, responded to the invitation of the authorities to grow vegetable marrows by sowing this area with marrow seed. It produced 24 tons 3 cwt., and he sold the crop through the Berkshire Fruit and Vegetable Society, which works under the Food Production Department Scheme for marketing surplus produce, for £144. In reporting the matter to the county society the grower says that had it not been for that body, which provided an easy means through which to dispose of the marrows, he would not have bothered to grow them at all. A good deal of similar testimony as to the stimulating effect on food production of the county marketing schemes has been received during the past season.

OWING to the removal of restrictions on the importation of apples, the Food Controller has issued an Order which came into force on the 16th December, 1918, revoking as from that date the Apples and Perry Pears (Sales) Order, 1918. The new Order controls the price of all apples, whether home-grown or imported.

The maximum retail price is 9d. per lb., and retailers are required to exhibit notices stating this maximum price. In the case of home-grown apples, the maximum price on a sale by the first owner, i.e., the grower, is 58s. 4d. per cwt. (packages may be charged for as provided by the Order).*

NOTE.—On a wholesale sale of any apples by a person other than the first owner, the maximum price is the first owner's price, together with the addition of 6s. per scheduled barrel or 2s. per scheduled case, or 10 per cent. on the first owner's price in any other case. Transport charges and market tolls may be added, and, in the case of home-grown apples, certain charges set out in the Order for the use of packages, may also be made.

THE Food Production Department of the Board announce that the Defence of the Realm Regulation under which the sale of horses owned by occupiers of agricultural holdings was prohibited except under licence was withdrawn on the 23rd November.

Sale of Agricultural Horses: Withdrawal of Prohibition.

AN Order (No. 1495), dated 19th November, 1918, has been made by the Food Controller to the effect that:—

Live Stock (Restriction on Shipment to Channel Islands) Order, 1918.

1. A person shall not, after the 1st December, 1918, send, take, consign or ship any cattle from Great Britain to any part of the Channel Islands, except under and in accordance with the terms of a permit granted by or under the authority of the Food Controller.
2. Every application for a permit under this Order shall be made to the Live Stock Commissioner having jurisdiction in the area from which it is proposed to send or take such cattle.

* The maximum prices in the case of imported apples provided in the Order are not here printed.

3. Permits issued under this Order may be made subject to such conditions as may be inscribed thereon or as may otherwise be prescribed by the Food Controller. The holder of any permit shall duly observe the conditions thereof and shall produce such permit upon the demand of any person duly authorised in that behalf by the Food Controller.

4. Permits issued under this Order shall not authorise or be deemed to authorise any movement of cattle in contravention of any Order of the Board of Agriculture and Fisheries made under the Diseases of Animals Acts, 1894 to 1914, or any regulation made thereunder.

THE Food Controller has issued a Notice (Order No. 1502, dated 20th November, 1918), under the Cattle Feeding Stuff (Distribution)

**The Cattle Feeding
Stuff (Distribution)
Order, 1918:
Notice and General
Licence.**

Order, 1918*, stating that a person named as a supplier in any certificate granted under the above named Order in respect of an application made on the prescribed forms L.F.S. 3 (Pig Clubs) and L.F.S. 4 (Small Owners of Pigs) may supply to the person named or referred to as a buyer in such certificate, and a person named or referred to as a buyer in such certificate may obtain from the person named therein as a supplier, millers' offals to an amount exceeding by 50 per cent. the amount stated in such certificate.

The Food Controller has also issued a General Licence under this Order, dated 20th November, allowing producers of cattle feeding stuffs to use, for the purpose of feeding horses employed by them solely for their trade or business, supplies of the particular cattle feeding stuffs produced by them. This permission does not exempt such persons from complying with the provisions of the Horses' Rationing (No. 2) Order, 1918.†

THE Army Council have made an Order, dated 13th November, 1918, prescribing that where a farmer is desirous of purchasing straw (other than oat straw) from a producer for the purpose of thatching ricks of corn or hay, he may do so, subject to the following conditions :—

**Sale of Straw for
Thatching
in Great Britain.**

1. The purchaser must deliver to the seller a certificate stating—
 - (a) The quantity of straw required, which must not exceed 3 tons in any one instance.
 - (b) That the straw is required for thatching ricks of hay or corn and for no other purpose.
2. The certificate must be signed by the purchaser and must give his address together with the name and address of the seller.
3. When the whole of the straw for which the certificate is given has been removed, the seller must forward the certificate to the District Purchasing Officer for Supplies of the county concerned.‡
4. The price paid for such straw shall not exceed the maximum stack price laid down by any Army Council Order that may for the time being be in force, together with any actual cost incurred for tying, or carting a distance further than the nearest railway station.

* Printed in this *Journal*, November, 1918, 1008.

† Printed in this *Journal*, November, 1918, p. 1005.

‡ A list of the names and addresses of these officers was printed in this *Journal*, September, 1918, p. 749.

AN Order (No. 1484), dated 14th November, 1918, has been made by the Food Controller amending the Grain (Prices) Order, 1918,* as follows :—

**The Grain (Prices)
Amendment
Order, 1918.**

1. Where barley is bought by a person requiring and holding a licence granted by or under the authority of the Food Controller to purchase barley for a manufacturing business carried on by him, or by a recognised dealer buying for the purpose of filling a specific order given in writing by such a manufacturer, the maximum price shall be ascertained by adding 3s. per quarter to the standard rate.

2. Notwithstanding the provisions of Clause 9 of the Principal Order a person shall not until the 1st January, 1919, buy or sell or offer to buy or sell any barley for the purpose of seed at a price exceeding the maximum price for barley applicable under the Principal Order.

NOTE.—This Order came into force on the 14th November, 1918.

THE Food Controller has, by an Order (No. 1429), dated 7th November, 1918, fixed the following maximum prices for the sale of eggs. The Order came into force on 2nd December, 1918.

Description of Eggs.	For a Sale other than by Retail.	For a Sale by Retail.
	At a rate of per doz.	At a rate of per doz.
	s. d.	s. d.
Fresh eggs	5 0	5 6
Imported fresh eggs	5 0	5 6
Preserved eggs	4 0	4 6
Small eggs	2 8	3 0

The expression "eggs" shall include the eggs of any bird, except plovers' eggs and gulls' eggs.

The expression "fresh eggs" shall mean eggs produced in the United Kingdom, each weighing $1\frac{1}{2}$ oz. or more, and not having been preserved either by pickling or by being held in cold store, or otherwise.

The expression "imported fresh eggs" shall mean eggs imported into the United Kingdom each weighing $1\frac{1}{2}$ oz. or more and not having been preserved either by pickling or being held in cold store or otherwise.

The expression "preserved eggs" shall mean eggs each weighing $1\frac{1}{2}$ oz. or more, which have been preserved either by pickling or by being held in cold store or otherwise.

The expression "small eggs" shall mean all eggs weighing less than $1\frac{1}{2}$ oz.

THE following Notice was issued by the Food Production Department of the Board on 1st December :—

**Importance of
Winter Spraying.**

Fruit growers are reminded that from now until the buds begin to break in February or March, is the time to clean trees covered with moss or lichen.

The fruit plantation or orchard must be kept in a thoroughly sanitary condition if insect and fungus pests are to be controlled; firstly, because the growth of moss and lichen has a stunting effect on the trees and makes them less resistant to disease, and, secondly, because the number of insects which can hibernate actually on the trees is greatly reduced. A thorough drenching with a caustic soda solution (1 lb. of caustic soda to 5 gal. of water) is the most satisfactory way of ridding the trees of moss and lichen.

On trees which are not very foul but which still require cleaning, lime wash or lime-sulphur solution (winter strength) may be substituted. Lime washing should be deferred until as near the end of the dormant season as possible; the attacks of aphid and apple sucker are thereby controlled by the coating of lime preventing large numbers of eggs from hatching. In fact, the most effective applications are made when the buds are just breaking and showing green. Lime-sulphur (winter strength) can be used for cleansing the trees whilst they are quite dormant and for this purpose 3 qt. of concentrated lime-sulphur solution (1·3 sp. gr.) should be diluted with 10 gal. of water, or as the buds are just breaking, when the strength should be 3 pt. of concentrated lime-sulphur to the same quantity of water. Before the application of any of these washes all dead branches and diseased wood should be removed from the trees and burnt.

After using a lime or lime-sulphur wash, care must be taken to clean thoroughly all valves and internal parts of the spraying machines before putting them away. If a lime-sulphur wash is used, care must be taken not to use a machine with a copper container, as the copper and sulphur will react and render the machine useless for further work.

For full particulars as to the making of the various washes, readers are referred to *Food Production Leaflet No. 39*, "The Control of Pests of Fruit Trees in Gardens and Small Holdings," obtainable from the Secretary, Board of Agriculture, 3, St. James's Square, London, S.W. 1, on receipt of an unstamped post-card.

THE following Notice was issued by the Board on 13th November :—

From time to time the attention of the Board is directed to cases of illness, or even death, of calves resulting from the use of linseed or linseed cake. In view of the widespread

Linseed Poisoning. popularity of these foods for calf-rearing it is obvious that such cases of trouble must be comparatively rare, but they serve to direct attention to the fact that a certain amount of care is necessary in the feeding of linseed or linseed cake to young stock. The risk is negligible with adult animals, and in the case of young animals only arises when the linseed meal or linseed cake has been treated with water some little time before feeding. It is due to the fact that linseed contains two substances which in presence of water tend to interact and produce small quantities of the deadly poison, prussic acid. This does not prevent linseed and linseed cake

being very good and very safe foods *when properly used*. All that is necessary is that if the linseed is treated with water at all it must be kept for a little time at practically boiling temperature. The safest plan is actually to *boil the linseed with the water*; if this cannot be done conveniently and "scalding" is resorted to, it is necessary that the water should be absolutely boiling as it is poured on the meal, using at least ten times as much water as meal (1 gal. water to 1 lb. meal) and stirring carefully until quite free from lumps. If this procedure is followed closely the mixture should be quite safe to feed, especially if prepared not long before feeding time.

As a rule home-grown linseed offers less risk of poisoning than linseed imported from hotter climates, but there is no linseed meal (or cake) which can not be rendered quite harmless if properly prepared for feeding in the manner indicated.

In a Circular Letter (No. C.L. 58/H.), dated 22nd November, 1918, addressed to Horticultural Sub-Committees, the Food Production Department state that, in order to secure the adequate

Beekkeeping. distribution of the limited supplies available, and to make sure that these supplies are used solely for bee food, the Royal Commission on Sugar Supply has notified the Department of its decision to ration the candy or bee food to beekeepers.

The Royal Commission is prepared to recognise the County Horticultural Sub-Committees as the agents for carrying out the rationing scheme, and Horticultural Sub-Committees are asked to form forthwith a Bee Committee for the purpose of assisting the Department in carrying out the rationing scheme. The Department suggest that the Bee Committee should be composed of members of the Horticultural Sub-Committee, say the Chairman and not less than three other members, together with three co-opted members, representative of the bee-keeping interests in the county. In the event of there being a salaried beekeeper in the county, it is suggested that the committee should take steps to secure his services on the committee.

In order to carry these suggestions into effect, it is desirable that committees should immediately approach the Beekeepers' Association in the county with the view of obtaining their co-operation in the nomination of suitable representatives.

The procedure with respect to the rationing scheme will be as follows :

The Bee Committee will compile a register of the beekeepers, and of the stocks of bees in the county. Each beekeeper will be required to register prior to 31st December, 1918, on a special form supplied by the Department. The forms are in the course of preparation, and as soon as they are available the Bee Committee will take all the necessary steps to inform beekeepers that if they are to receive their due ration of bee food for Spring feeding, they must register with the Horticultural Sub-Committee before the above date.

The returns thus obtained will provide a complete survey of the state of beekeeping in the county, and will indicate the number of beekeepers and the number of live stocks, (a) in movable hives, (b) skeps, boxes or other make-shift hives. The committee will supply the Horticultural Division with the returns thus obtained, and the returns will serve as a basis for the allocation of bee food to the beekeepers in the county.

The Bee Committee will arrange with local retailers for the distribution of the candy ration of bee food, and it will be necessary to make known throughout the county the names of distributors, so that bee-keepers may be able to secure their ration by presenting a signed duplicate of their registered form.

The Horticultural Sub-Committee should notify the Department as soon as the Bee Committee is constituted, in order that they may be informed of the Department's proposals with respect to the County Bee-Restocking Schemes, and the provision for technical advice and instruction.

THE following Notice was issued by the Food Production Department of the Board towards the end of November :—

**Organised
Horticulture.**

The Food Production Department have appointed nine Divisional Technical Inspectors (three for fruit and six for vegetables and general cultivation), who have been instructed to get into touch with Horticultural Sub-Committees with the idea of arriving at a common plan of action for securing that instruction and advice on technical matters relating to horticulture may be given on definite lines throughout the counties. The Department wishes arrangements to be come to with the Royal Horticultural Society and other bodies so that the whole country may be covered during the autumn and winter by lectures given on up-to-date methods.

All applications for lectures to allotment associations, etc., must be made direct from the Secretary to the Horticultural Sub-Committee of the county.

THE following Press Notice was issued by the Food Production Department of the Board on 18th November :—

Waste Lime from Acetylene Manufacture. Owing to the continued action of acid fumes from manufacturing processes and possibly to a natural deficiency of lime, the soils in the vicinity of large towns frequently become acid and their crop-producing power suffers accordingly. The attention of allotment holders in these districts is, therefore, drawn to the value, for soil treatment, of the waste lime that is often produced locally in the manufacture of acetylene gas. Recent investigation by the Food Production Department has shown that, when in a well-drained condition, such waste lime possesses a value approaching that of carbonate of lime as an improver of soil conditions. When in the fresh state the lime is distinctly wet, but the excess liquor rapidly drains away and the lime becomes more or less friable. It is recommended, however, that it should be applied to the land at the rate of about $\frac{1}{2}$ cwt. per rod in autumn or early winter and exposed to the action of rain and frost. It may then be raked or dug into the soil during the spring.

WITH reference to the Notice on the outbreak of Rabies in Devon and Cornwall, which was published on page 1023 of the issue of this *Journal* for last month, 90 outbreaks of

Rabies.

this disease have now been confirmed, and there are 45 cases at present under investigation.

THE following Notice was issued by the Board on 27th November :—

The President of the Board of Agriculture and Fisheries desires to inform Incumbents who propose to dispose of their land under the Glebe Lands Act, 1888, that it is unnecessary for them to incur any initial expenses in having the land valued. It is the Board's practice, in dealing with applications for their approval to sell under the Glebe Lands Act, themselves to select and instruct the valuer.

THE Board of Agriculture and Fisheries desire to give notice of the publication by H.M. Geological Survey of Great Britain of a Memoir on the Water Supply of Essex from underground sources, price 15s.

**Memoir on the Water
Supply of Essex from
Underground
Sources.**

The Memoir contains, in addition to well-records, chapters dealing with the water-bearing beds, rainfall, chemistry of Essex waters with analyses, contamination and risk thereof, supplies from springs, wells and borings. It is accompanied by an extensive bibliography and by maps showing (1) the underground water-level in the chalk around the head-waters of the Stort and Cam, (2) the amount of chlorine in deep-well waters, (3) wells giving alkaline waters, (4) the rainfall.

Copies may be obtained through any bookseller from Messrs. T. Fisher Unwin, Ltd., 1, Adelphi Terrace, London, W.C., who are the sole wholesale agents to the Trade outside the county of London; or from the Director-General, Ordnance Survey Office, Southampton.

Two Acts of direct agricultural interest were adopted at the recent session of the Alberta Legislature :—

**Advances of Seed
Grain in Alberta.**

Municipal Districts Seed Grain Act.—The Municipal Districts Seed Grain Act gives municipalities power to borrow money on the guarantee of the province for the purchase of seed grain to be supplied to resident owners and tenants on patented lands, the loan to the latter not to exceed \$300 (£60) in value for each quarter section. The interest charged is not to exceed that paid by the municipal district, and the debt is to be secured by a lien on the crop and on the land. If the declaration note is not paid by the 31st December, it rests with the secretary of the municipality to enforce the lien by distress or suit.

The Seed Grain Act, 1918.—The Seed Grain Act, 1918, is almost identical with the Seed Grain Act of 1917, and provides that the Provincial Treasurer, or the Minister of Agriculture, can authorise any person to advance seed grain, or any chartered bank to advance money for the purchase of seed grain, to owners or occupiers of patented lands, other than in municipal districts, or to the wives or other representatives of owners who are on active military or naval service, and the Provincial Treasurer or any chartered bank, or individual, advancing seed grain, or money for the purchase of the same, is entitled to take security by promissory note, real estate mortgage, or chattel mortgage. Penalties are provided for persons making use of seed grain, or the money advances for its purchase, for any other purpose than that for which it will be obtained.

SINCE the date of the List given on p. 246
Leaflets Issued by the of the *Journal* for May, 1918, the following
Board of Agriculture. Leaflets have been issued in the *Permanent*
Series :—

- No. 301.—*Insect and Fungus Pests of Basket Willows.*
 „ 322.—*Winter Pruning Bush and Half Standard Apple Trees.*
 „ 324.—*Buttermilk Cheese.*
 „ 325.—*The Manufacture of Small Cheese with Improvised Apparatus.*

The following *Food Production Leaflets* have been issued :—

- F. P. No. 14.—*The Rearing of Calves in the Summer and Autumn of 1918.*
 „ „ 30.—*Preparing Rabbits for the Table and Market.*
 „ „ 45.—*Skim Milk Cheese.*
 „ „ 46.—*The Feeding of Concentrated Food to Dairy Cows on Pasture.*
 „ „ 47.—*The Testing of Seeds Order, 1918.* (This replaces Food Production Leaflet No. 18.)
 „ „ 48.—*How to Increase Stocks of Bees.*
 „ „ 49.—*The Need for Caution in the Feeding of Live Stock under Present Conditions.*
 „ „ 50.—*The Harvesting of Corn Crops.*
 „ „ 53.—*Storage of Sulphate of Ammonia on Farms.*
 „ „ 54.—*The Cropping of Grass Land Broken up for 1918 Harvest.*
 „ „ 55.—*Methods of obtaining Strong Stocks of Bees for Overwintering.*
 „ „ 56.—*Floods and Waterlogged Land: The Land Drainage Act of 1918.*
 „ „ 58.—*Silver Leaf Disease in Fruit Trees.*
 „ „ 59.—*Economy in the Use of Hay.*

In addition, the information in the following *Permanent Leaflets* has been revised and brought up to date :—

A List of the Board's Leaflets may be obtained post free on application to the Secretary, Board of Agriculture and Fisheries, 3, St. James's Square, London, S.W. 1. Letters of application so addressed need not be stamped

THE following Notice was issued by the Board on 10th December :—
In order to deal with some of the urgent commercial problems in connection with agriculture which will arise during

Reconstruction of the Commercial side of Agriculture: Official Appointment. the period of demobilisation and reconstruction, the President of the Board of Agriculture and Fisheries has appointed Mr. Lawrence Weaver, C.B.E., formerly Controller of Supplies in the Food Production Department, to act as (temporary) Commercial Secretary of the Board

A temporary establishment will be formed by the amalgamation of various branches within the Board, and will be charged with all reconstruction measures for the better organisation of the commercial side of agriculture, with farmers' supplies (hitherto dealt with by the Supplies Division of the Food Production Department), rural transport, and cognate matters. Mr. Weaver will also supervise the provision of cottages and other buildings on small holdings and farm colonies required for the re-settlement of service men on the land.

THE following Press Notice was issued by the Ministry of Food on 6th December :—

Additional Supplies of Chicken Food.

With a view to providing additional supplies of chicken food at reasonable prices, the Ministry of Food is arranging to render available limited quantities of the materials necessary for the manufacture of such food for chicks up to six weeks old. Firms desiring to receive allocations should apply to the Director of Feeding Stuff Supplies, New County Hall, London, S.E. 1, for a copy of Form Ch.R. 1.

Allocations will only be made to Firms who made these mixtures in 1916, and will be made in proportion to the quantities dealt with during that year. Makers will be required to comply with the directions issued by the Ministry of Food as to the distribution of the manufactured foods and as to the prices to be charged.

Applications for very small quantities cannot be entertained, but small firms who are able to group their demands together for delivery to one railway station may make joint application.

Retailers who wish to receive supplies for sale of the foods made under the above arrangements, should apply to their usual suppliers of chicken foods. In any case of difficulty in obtaining supplies, application should be made to the above address.

NOTWITHSTANDING the provisions of the Dredge Corn Order, 1917,† the Food Controller has authorised as from the 1st December, 1918,

The Dredge Corn Order, 1917: General Licence.*

until further notice, every producer of such dredge corn as consists of a mixture of cereals grown together containing more than one cereal as a main constituent, to use such dredge corn for the purpose of feeding his live stock.

* Order No. 1592, dated 24th November, 1918.

† Order No. 1182 of 1917, as amended by No. 1309 of 1918. See this *Journal*, December, 1917, p. 1028, and November, 1918, p. 1014.

THE Food Controller, by an Order (No. 1578), dated 30th November, 1918, has prescribed that as from the 3rd December, 1918, until further notice, the **The Cattle Feeding Stuff (Maximum Prices) Order, 1918.*** maximum price on a sale of flour millers' offals of all kinds shall be £14 10s. per ton in place of £13.

THE Food Controller has issued an Order (No. 1590), dated 31st October, 1918, which provides that the Potatoes (1918 Crop) (Restriction) Order, 1918,† shall be revoked without prejudice to any proceedings in respect of any contravention thereof.

THE Food Controller has issued a General Licence under the Potatoes (Consolidation) Order, 1918,‡ providing that notwithstanding the restrictions imposed by Clause 2 (a) of this Order, potatoes may until further notice be moved and consigned from the Zonal area P.C.7, comprising Herts, Essex (outside London Postal Area), Middlesex (outside London Postal Area), and Bedford, to the Zonal area P.C.6, comprising London (Postal Area), and purchases may be made and delivery taken of potatoes accordingly.

PRELIMINARY statement (dated 4th December, 1918), showing the **Agricultural Returns of England and Wales, 1918. Produce of Crops.¶** estimated total produce and yield per acre of the potato and root crops in England and Wales in the year 1918, with comparisons for 1917, and the average yield per acre of the ten years 1908-1917.

¶ See also Note on Agricultural Conditions in England and Wales on 1st December, on p. 1139.

CHARLES FORSYTH, Saplinbrae, Tyrebagger, Aberdeenshire, was charged at Aberdeen with having used 900 2-lb. loaves for feeding pigs and poultry. For 15 years accused had obtained rejected loaves from an Aberdeen firm of bakers for this purpose. In some of the loaves the dough had not risen, several were burnt, and some were too old for human food. They were consigned in boxes for 1s. per box. The magistrates said the action of the firm who sold the bread must be very carefully investigated. Defendant had made a substantial profit, as he could get big prices for poultry and pigs. A fine of £10 was imposed.

William Collins, treasurer of a poultry association, was charged with having obtained barley for the feeding of poultry. It was stated that he had approached a farmer who had some barley but questioned his right to sell it for the purpose. Defendant expressed the opinion that such a sale was in order, and the farmer, after taking advice, agreed. The barley was delivered at the Association's Headquarters. The Authorities demanded a return of all corn purchased by this body, and Collins, though submitting that the barley was not fit for human use, was fined. (*National Food Journal*, 9th October, 1918.)

At Ross a fine of £70, with £5 special costs, was imposed on Arthur Thomas Webb, Hill of Eaton, Foy Ross, farmer, for selling the carcass of a beast to a butcher without being registered as a wholesale dealer in meat. Defendant slaughtered a casualty beast privately and sold it to a local butcher. On hearing that the Divisional Inspector was in the district he arranged to fetch the carcass away again. In the meantime, however, the local butcher had sold over 30 lb. of meat from it.

Harry Parry, the butcher, was fined £5 for aiding and abetting. (*National Food Journal*, 23rd October, 1918.)

MISCELLANEOUS NOTES.

THE *International Crop Report and Agricultural Statistics* for November, 1918, published by the International Institute of Agriculture, gives particulars concerning the production of the cereal crops of 1918 in certain countries in the Northern Hemisphere. *Wheat*.—The production in Spain, Great Britain, Italy, Luxemburg, Netherlands, Sweden, Switzerland, Canada, United States, British India, Japan, Egypt, and Tunis is estimated at 250,300,000 qr. in 1918, against 211,994,000 qr. in 1917, or an increase of 18·1 per cent. *Rye*.—The estimated production in Spain, Ireland, Italy, Luxemburg, Netherlands, Sweden, Switzerland, Canada, and United States is placed at 18,726,000 qr. this year, or an increase of 31·5 per cent. compared with last year, when it amounted to 14,245,000 qr. *Barley*.—The production in Spain, United Kingdom, Italy, Luxemburg, Switzerland, Canada, United States, Japan, Egypt, and Tunis is

estimated to amount to 71,165,000 qr. in 1918, against 64,976,000 qr. in 1917, or an increase of 9·5 per cent. *Oats*.—It is estimated that the total yield in Spain, United Kingdom, Italy, Luxemburg, Netherlands, Sweden, Switzerland, Canada, United States, and Tunis will amount to 254,044,000 qr. in 1918, against 249,596,000 qr. in 1917, or an increase of 1·8 per cent. *Maize*.—The production in Spain, Switzerland, Canada, and United States is estimated at 324,596,000 qr. this year, against 372,861,000 qr. last year, or a decrease of 12·9 per cent.

Canada.—According to the official report issued by the Dominion Bureau of Statistics on 18th September, the preliminary estimates of the average yield per acre of the principal grain crops are as follows, the figures for last year, and the average for the last ten years, being given in brackets:—Spring wheat, 12½ (15½ and 19) bush.; autumn wheat, 16½ (21½ and 23) bush.; barley, 25½ (23 and 27) bush.; oats, 33 (30½ and 35½) bush.; rye, 14½ (16½ and 18½) bush.; linseed, 8 (6½ and 10½) bush. The condition of other field crops on 31st August, measured against 100 as representing the average decennial yield, is as follows:—Mixed grains, 100; peas and beans, 106; buckwheat, 91; potatoes, turnips, mangolds, etc., 96; maize for fodder, 96; pastures, 87. The stocks in Canada on 31st August were about 4,000,000 bush. of wheat, 1,453,500 bush. of barley and about 15,000,000 bush. of oats, the quantities in farmers' hands being about 400,000 bush. of wheat, 354,000 bush. of barley, and 8,500,000 bush. of oats.—(*The London Grain, Seed and Oil Reporter*, 3rd December, 1918.)

United States.—According to a Government Report the maize crop is estimated at 2,749,000,000 bush., as against 3,159,000,000 last year. This is 31,000,000 bush. above the October estimate. The quality of the crop is excellent. Farm reserves are 118,400,000 bush. against 34,400,000 bush. last year, and the supply is 12,000,000 bush. above the average for the last five years.—(*The London Grain, Seed and Oil Reporter*, 28th November, 1918.)

New Zealand.—According to the official interim report of the Department of Agriculture on the crop returns for the season 1917–18, the yields of crops, according to threshing returns, were as follows, last season's figures being given in brackets:—Wheat, 6,761,249 (5,251,227) bush.; barley, 572,061 (738,050) bush.; oats, 4,785,391 (5,371,436) bush.; maize, 363,689 (274,283) bush.; potatoes, 97,944 (133,642) bush.—(*Broomhall's Corn Trade News*, 21st November, 1918.)

Live Stock in Canada.—The numbers of live stock in Canada in 1918 are as follows (the corresponding figures in 1917 being shown in brackets): Horses 3,608,315 (3,412,749); milch cows, 3,542,429 (3,202,283); other cattle, 6,507,267 (4,718,657); sheep, 3,037,480 (2,369,358); pigs, 4,289,682 (3,619,382). (*International Crop Report and Agricultural Statistics*, November, 1918.)

Live Stock in New Zealand.—The numbers of live stock in New Zealand on the 31st January, 1918, are as follows (the numbers on the corresponding date in 1917 being shown in brackets):—Horses, 378,991 (373,600); cattle, 2,888,214 (2,575,230); milch cows, 797,569 (777,439); pigs, 258,269 (283,770). The number of sheep on the 30th April, 1918, was 26,538,302, against 25,270,386 on the 30th April, 1917. (*International Crop Report and Agricultural Statistics*, November, 1918.)

THE Crop Reporters of the Board, in reporting on agricultural conditions in England and Wales on the 1st December, state that the weather

**Agricultural
Conditions in England
and Wales
on 1st December.**

during November has been fairly favourable for autumn work, though less so upon the eastern side of the country. In many districts part of the arrears have thus been made good, but the general position is still rather backward for the time of year. About two-thirds of the area intended for wheat is now reckoned to be sown, and, as compared with the 1st December last year, the area sown is from 5 to 10 per cent. less, but the situation was then more forward. Other autumn-sown crops are similarly rather behind last year. Where up, the young corn appears quite satisfactory. Owing to the general damp condition of the land, broadcasting of wheat has been adopted rather more frequently than usual.

The potato harvest has been practically completed in most parts of the country : rather more disease has come to light, and there are some reports that the tubers are not in all cases keeping well. Roots are of quite satisfactory quality generally, but their condition is often dirty. The yield of potatoes, 6·6 tons per acre, is equal to that of last year, and one-third of a ton above the average. The total production amounts to 4,200,000 tons, by far the largest ever raised, and 868,000 tons, or more than 25 per cent., above last year's record. Turnips and swedes show a yield just over average, 13·2 tons per acre, and more than half-a-ton above last year ; the total production, however, owing to the reduced acreage, amounts to 12,018,000 tons, and is a little below last year's total. Mangolds, with 20·6 tons per acre, are about 1 ton above average, but 1½ tons below last year ; the total production amounts to 8,231,000 tons, which, although a quarter of a million tons less than in 1917, is, apart from last year, the highest since 1912.

Live stock have done only moderately well during the month, partly owing to the shortage of artificial feeding stuffs. Prospects for winter keep are on the short side in many parts of the country.

Labour is still short, but the situation is, if anything, very slightly easier than a month ago, though influenza has been responsible in many places for delay, both in pulling roots and sowing corn.

THE following local summaries give further details regarding agricultural conditions in the different districts of England and Wales :—

**Agricultural Labour
in England and Wales
during November.**

Northumberland, Durham, Cumberland, and Westmorland.—Labour is still very deficient, and in Cumberland the influenza epidemic has added to the difficulty.

Lancashire and Cheshire.—The supply of labour is deficient, but most of the work has been got through.

Yorkshire.—The supply of labour varies, though there is usually about sufficient, in a few districts there is some difficulty in carrying on.

Shropshire and Stafford.—The supply of labour is still short, but there seems to be some improvement.

Derby, Nottingham, Leicester, and Rutland.—Skilled labour is still scarce, but prisoners of war have been of use, and school children have helped with potato lifting.

Lincoln and Norfolk.—The supply of labour, practically throughout the division, is deficient, partly owing to so many men being laid up with influenza.

Suffolk, Cambridge, and Huntingdon.—The supply of labour is still short.

Bedford, Northampton, and Warwick.—The supply of labour is improving, and with few exceptions is sufficient to meet present requirements.

Buckingham, Oxford, and Berkshire.—Conditions are much the same as last month. The prevailing illness has caused shortage in some districts.

Worcester, Hereford, and Gloucester.—Labour is still scarce, especially skilled hands, but there is an improvement in some districts. Women and children have helped materially in the lifting of potatoes and roots, and the necessary work is being done.

Cornwall, Devon, and Somerset.—The supply of labour is still short, especially skilled hands, but much assistance has been given by women and soldiers.

Dorset, Wiltshire, and Hampshire.—The supply of labour is still short, but much assistance has been given by women, soldiers, and prisoners of war.

Surrey, Kent, and Sussex.—The supply of labour, particularly skilled hands, is still short, but the deficiency has been met to some extent by the aid of women, soldiers, and prisoners of war.

Essex, Hertford, and Middlesex.—The supply, though often short, is not generally seriously deficient.

North Wales.—The supply is usually sufficient, though short in a few districts.

Mid Wales.—The supply of labour, though sometimes scarce, is about sufficient as a rule. Women have assisted greatly with potato and mangold pulling.

South Wales.—In some places the situation is easier, in others labour is seriously scarce, and work behindhand. In most cases the usual outside help has met the need.

* Estimated carcass weight.

NOTE.—The prices per lb. for sheep do not include the value of the skins, which during November made prices equivalent to an additional 1½d. per lb. of the carcass weight for Downs, Longwools, and Cross-breds, and 1½d. for Cheviots, Blackfaced and Welsh, and during October 1½d. per lb. for Downs, Cheviots, and Cross-breds, 1½d. for Longwools, and 1d. for Blackfaced and Welsh.

In addition to the price quoted above for sheep per lb., sellers were entitled, under the Live Stock (Sales) Order, 1918, to charge during November an extra amount ranging from 6d. to 1s. 8d. per head, according to the weight of the sheep.

THE JOURNAL

OF THE

BOARD OF AGRICULTURE

Vol. XXV. No. 10.

JANUARY, 1919.

EDITORIAL NOTES.

DURING the last few months a very great deal has been said and written on the question of the settlement of ex-Service men on the land. There would seem to

Land Settlement. be no doubt that there is a very fair percentage of men serving in the Army who are desirous of settling on the land rather than of returning to their previous work, much of which, by the way, is now being efficiently done by women, particularly where clerical, shop and factory work is concerned. Steps of a far-reaching nature are being taken to assist the men involved, not only as regards preliminary instruction before demobilisation and training after demobilisation, but in relation to the actual provision of holdings after the men have had practical experience of agriculture through employment with good farmers. The War Office, the Board of Agriculture, the Food Production Department, the Ministry of Labour, the Department of Demobilisation, and the County Councils are co-operating to provide reasonably good instruction and training, to facilitate the discharge of the men, to secure employment with experienced farmers for those concerned, and to provide land for settlement in due course.

Attention is particularly directed to the article on Land Settlement in the Mother Country at p. 1152, and to the Notices at pp. 1242 and 1243. Literature on Land Settlement can be obtained on application to the Secretary, Board of Agriculture and Fisheries, 4, Whitehall Place, London, S.W. 1.

* * * * *

THE shortage of supplies of the more important foodstuffs makes it essential that there should be no slackening of effort on the part of all producers to ensure in the years which are to come increased production over the year which has gone.

Increased Production. Total crop production may be increased in several ways—by an extension of the arable acreage, which is gradually taking place; by increasing the average yields per acre—by a wise and judicious use of artificial manures; by the

conservation and use of farmyard dung and liquid manure ; by combating insect, fungus and other pests of crops ; by thorough and clean tillage ; by the use of the best tillage implements ; by draining ; by liming ; by the use of high quality seeds and prolific varieties ; by the use of clovers and green fodder crops ; and by a general effort to improve grass land of all types. Average yields, in particular, are capable of considerable improvement, and farmers might usefully note the results recorded (p. 1161) by Mr. Arthur Amos, relative to yields of wheat grown on three fields in Kent last year. The yield of 64 bush. per acre on an area of $15\frac{1}{2}$ acres in 1916 (p. 1162) must be regarded as excellent, but this yield was exceeded in the same field in 1918 by 8 bush. per acre, while in other fields of about 8 acres and $3\frac{1}{2}$ acres the yields were 76 bush. and 96 bush. per acre respectively. Particular attention was devoted to the variety to be sown and that chosen was Yeoman, produced at Cambridge by Professor Biffen. The details of the method of growing such phenomenal crops on three fields will prove of interest to all wheat growers.

* * * * *

IN the extracts from speeches of the Prime Minister, given at p. 1190, occurs the following passage :—

“ You must have reclamation of waste
Land Reclamation land. That cannot be undertaken by
and Drainage. individual landowners, for the simple
 reason that it may not depend entirely on them. For instance,
 there is the draining. It is no use your draining one part if
 you know that the next part is not drained.

Reclamation has got to be a connected effort directed by the State, and at the present moment there are hundreds of thousands of acres that, on investigation, have been demonstrated to be capable of being reclaimed.”

Drainage and land reclamation go hand in hand, thorough drainage alone going far to reclaim some areas, while other areas under treatment must also be drained if success is to be ensured. Various advances have been made from time to time from the Development Fund for the purpose of enabling reports to be made on areas extending to many thousands of acres which are considered capable of reclamation (*e.g.* see p. 1189). The Board are now conducting inquiries with a view to initiating drainage authorities upon a number of rivers, the object being to improve the main drainage of land for agricultural purposes. On many rivers and drainage areas in England and Wales a considerable amount of clearance has already been done by means of prisoners of war, and marked improvements have been effected. In other cases remarkable results have

been achieved at comparatively small cost, and figures given elsewhere in this *Journal* (p. 1220) show that in the West Riding of Yorkshire alone the Agricultural Executive Committee have reclaimed 1,100 acres and improved 64,977 acres, the individual figures being most striking. Notes on land drainage appear at pp. 1218 and 1220; the Land Drainage (Constitution of Authority) Regulations, 1919, are given at p. 1226; and an official notice concerning the need for clear drainage outlets is printed at p. 1228. Articles on the reclamation and cultivation of waste or unimproved land have recently appeared in this *Journal* as follows:—Poverty Bottom: An Experiment in Increased Food Production, February, 1918, page 1186; Baynard's Estate, Cranleigh: An Example of a War Committee's Efforts to Increase Food Production, April, 1918, p. 17; A War-time Food Production Effort in Lancashire, September, 1918, p. 576; and Floods and Waterlogged Land, November, 1918, p. 961.

* * * * *

THERE are even at the present day, and despite the lessons of the War, too many cases in which farmers exercise no care in dealing with farmyard manure and the

**Preservation of
Farmyard Manure.**

liquids which drain from the byres and from the dung heap. The importance of the dung heap was dealt with in the "Notes on Manures" in the issue of this *Journal* for November last, p. 977, and in the present number a brief article (p. 1197) deals with the subject and gives simple rules for conserving farmyard manure. Farmers might feel stimulated to devote special attention to the preservation of both solid and liquid manure if they would consider for a moment what reply they would be compelled to make to the question: "Where do these materials come from in the first place?" In answering such a question farmers will not forget that farmyard manure represents the residue, after consumption or use for litter by their stock, of (1) crops grown on the farm at considerable expense, and (2) purchased feeding stuffs of very high value. It is clear that these residues are in themselves of considerable money value for manurial purposes, owing to their content of nitrogen, phosphoric acid and potash, as well as because of the bulk of carbohydrate matter they add to the soil. Unless, therefore, farmers are slack in their views on economy, and too freely permit waste, they will make really strenuous efforts to conserve, and utilise to the full on their farms, every hundredweight of the manurial residues from the food fed to their stock and the litter trodden under in the stalls, pens and yards.

LAND SETTLEMENT IN THE MOTHER COUNTRY.

THE English and Scottish Boards of Agriculture have issued, with the approval of the Admiralty and the War Office, a booklet entitled "Land Settlement in the Mother Country." The object of the booklet is briefly to explain the steps that have been, or will be taken to settle ex-Service men on the land after the War, and to explain impartially the prospects of success and what qualifications ought to be possessed by those who desire to take up farming or market gardening in the Mother Country.

The Committee appointed by the Government in the early days of the War to consider the question of the employment or settlement of ex-Service men on the land recorded their opinion that it was only right and fitting that those men who had answered the call of their King and Country should be encouraged and assisted to find occupation on the land for which they had fought, provided such conditions could be ensured as would offer them a reasonable prospect of success.

SETTLEMENT ON THE LAND.—At the close of the War, Great Britain is more nearly in the position of a self-supporting country than she has been for the last forty years. The menace of the submarine campaign, by which Germany hoped to bring Great Britain to her knees, has been ward off no less by the exertions of the agricultural community than by the heroism of the British Navy.

The immediate danger is now past, but the experience gained in the course of the War cannot be neglected. The production of the largest amount of food from the soil of the Mother Country is recognised as being one of the first national interests, and it is the desire and intention of His Majesty's Government to maintain and extend, as far as possible, the revival of agriculture brought about by the necessities of war. In order that the land may be put to the fullest possible use for the benefit of the nation as a whole, it is necessary that as many individuals as possible should have a direct interest in the cultivation of the soil, and steps are being taken to provide for the settlement on the land, either as owners or occupiers, of men possessing the necessary experience and qualifications.

The conditions of agricultural life are already widely different from what they were before the War broke out. As a result of war emergency measures one and a half million acres of grass land have been ploughed up and are now producing corn and other crops. The increased area under the plough will mean an increased demand for agricultural labour, and it is confidently anticipated that, great as is the change that has already been made, much greater progress in the same direction will be necessary if full use is to be made of the land.

In the first place, the position of the agricultural labourer has been largely improved. In every county of the Kingdom Wages Boards have been established, and the agricultural labourer has the assurance of a due reward for his toil. In no county of England and Wales has a lower rate than 30s. for a week of 54 hours in summer and 48 hours in winter been fixed for any labourer over 18 years of age.

A man who has had no previous experience or training in agricultural work, but, for various reasons, is desirous of settling on the land after demobilisation, will require experience in the particular kind of agricultural work to which he wishes to devote himself before he can hope to maintain himself upon a small holding. Such experience can be best secured by *obtaining employment with a good farmer*, as practical knowledge of the various agricultural operations can thus be acquired. Training facilities for a limited number of such men may be available on one of the Board's Farm Colony Settlements referred to in a later paragraph, and it is hoped to extend the opportunities of training in other ways.

The Government intend to provide a certain number of "cottage holdings," that is to say, a cottage with a small area of land for market gardening, or a few acres of grass land, attached.

These holdings are intended for ex-Service men who, while working for wages, are desirous of cultivating a small piece of land in their spare time. Such holdings should afford a good beginning for those who possess only a limited amount of capital, and may form a stepping-stone to a small holding.

It will, however, be a legitimate ambition on the part of an agricultural labourer to rise through the intermediate stage of a small holder to the position of a farmer, and it is the intention

of the Government to provide every facility for an ex-Service man who is ambitious to rise in the agricultural industry.

The system of farming land in small holdings is by no means new. They have always held a most important place in English agriculture, as is shown by the fact that at the present time there are 278,556 agricultural holdings in England and Wales of from 1 to 50 acres in extent, representing 65 per cent. of the total number of holdings.

It will be seen, therefore, that agriculture presents openings for ex-Service men, whether they intend to work as ordinary wage earners or, if found suitable, as small holders. Those who intend to start for the first time should, however, weigh carefully their prospects. They should bear in mind the fact that, while agricultural employment will provide healthy surroundings, plenty of good food, a garden and good conditions for the children, yet there will be less amusement than is afforded by life in a town. For this reason the ex-Service man will probably desire, first, to make sure that his wife, if he has one, wishes to live in the country and will take a share in the work of any holding with which he may be provided.

Shortly, the openings offered in agriculture in England and Wales to ex-Service men are as follows :—

1. **Labourer.**—Good wages ; house and garden or grazing ground ; healthy employment.
2. **Small Holder.**—Suitable land on reasonable terms, with the prospect of making a living, with a prospect of improvement, provided he and his family are prepared to work hard.
3. **Colonist.**—Establishment on the land with other settlers on a commercial and co-operative basis, either as individual small holders or as members of a community sharing the profit derived from the working of the Colony as one large farm. Facilities for hiring machinery, implements, etc., from Central Farm. Benefit of advice and assistance from Director.

SMALL HOLDING COLONIES.—The Board of Agriculture and Fisheries have acquired four Estates at Patrington, East Riding of Yorkshire ; Holbeach, Lincs ; Heath Hill, Salop ; and Pembrey, Carmarthen, for the purpose of giving a trial to the land settlement of ex-Service men under a colony system,* the

* See this *Journal*, April, 1918, p. 71.

Colony at Pembrey being intended for Welshmen. The Board have power to acquire additional land, not exceeding a further 54,000 acres, for the purpose.

The distinctive feature of such a system is that it is founded on a communal and co-operative basis in order to provide social life for the settlers, the organised buying and selling of produce, and the joint use of horses, implements and machinery. It is proposed that the settlers should work on a Colony either as individual small holders or as members of a community which would share the profits derived from working the Colony as one large farm. There are thus two kinds of Colony, each with a distinct method of working. These methods may be described as the "small-holding" and the "profit-sharing" systems.

(1) **The Small-Holding System.**—Under the "small-holding" system, the Colony will begin as one large farm under the management of a Director. Selected applicants will usually be employed as workers upon it, at the rate of wages current in the district, for such period of probation as may be found necessary, and at the end of that period any approved applicant desiring it will be allotted, at a reasonable but economic rent, such area of land as he appears likely to be able to cultivate successfully on his own account. If this area is not sufficient to enable a settler to obtain a complete living from his holding, he will be at liberty to fill in his time by continuing to work for wages either on the undivided portion of the Colony or other farms in the district, and he will be allotted further land as his growing ability and capital justify such addition, until he has an area which, when cultivated on the best system, will be large enough to support him entirely.

Even when all the small holdings have been taken up, a certain portion of the estate will be retained as a Central Farm under the management of the Director, and will be equipped with sufficient machinery, implements, horses, etc., to be let on hire to settlers requiring them.

The assistance and advice of the Director on all matters connected with the management of their holdings and the disposal of their produce will be available to the settlers.

A co-operative depot will be established for each Colony, through which settlers will be able to purchase their requirements, both agricultural and domestic, and also to dispose of their produce.

The Government have not hitherto made any direct advances of capital to ex-Service men desirous of taking up holdings, but it is hoped that industrious men, even if possessed of insufficient capital to take a whole-time holding, by starting as workers on the Central Farm, and at the same time cultivating a small acreage on their own account, may gradually be able to increase the area under their own control, until they are able to support themselves entirely from that source.

In the selection of settlers for the Colonies, preference will be given, as between men of equal capital, merit and qualifications, to those whose wives or other relatives have, as the result of their employment on the land either before or during the War, acquired some knowledge of farm work.

(2) **The Profit-sharing System.**—Under this system a Colony will be managed by a Director as one farm, the settlers being employed by him at the current rate of wages for the district, but receiving in addition a share of any profits arising out of the farming operations.

Each settler, however, will be provided, if desired, with about half an acre of land adjoining or near to his cottage, any surplus produce from which he will be helped to sell.

The working of the system may be briefly described as follows :—

The profits, after the current rate of interest (*e.g.*, 5½ per cent.) on capital, and the working expenses of the farm, the rent, rates, repairs and other annual charges had been paid, and after allocating a percentage to a reserve fund, would be divided between capital, management and labour, in proportion to the amounts that had already been paid out to them in the working account. In other words, each settler would receive a dividend on the amount of his wages for the year.

Settlers on the Colony would be entitled to invest any portion of their dividend or share of the profits in the form of shares in the capital of the farm. These shares would be entitled to interest at the rate prevailing (*e.g.* 5½ per cent.), and settlers would also be allowed to invest their other capital in the farm at the same rate. When settlers holding such share capital left the farm, or on death, the capital would be repaid.

Forms of application for holdings on these Colonies can be obtained from the Secretary, Board of Agriculture and Fisheries, 4, Whitehall Place, London, S.W. 1.

COUNTY COUNCIL SMALL HOLDINGS.—The great majority of the small holdings available for ex-Service men will have to be provided by the County Councils, and any man who desires to obtain, after demobilisation, a Small Holding of not more than 50 acres in England or Wales, should fill up the Form* printed in the middle of the booklet. If the man is a Soldier or Airman, he should hand the Application Form to his Commanding Officer for transmission to the Clerk of the County Council, at the County Town of the County in which he wishes to settle. If the man is a Sailor he should forward the Application Form direct to the Clerk of the County Council. Any man already demobilised or released from the Forces, should also forward the Application Form direct. Men who have previous agricultural experience and sufficient capital will naturally be given the preference, but the Government are hoping that men without sufficient capital of their own will either be provided with fully-stocked holdings or with loans to assist them in purchasing the necessary stock and implements. The amount of capital required for an ordinary small holding would not be less than £12 an acre, and in the case of a small fruit or market-garden holding a larger amount per acre is necessary.

As explained on page 1160 a considerable time (a year or more) may often elapse before small holdings can be secured and equipped with the necessary buildings, and whilst every effort will be made to provide holdings as quickly as possible for those who apply, men are strongly advised to secure temporary employment on the land in the meantime.

GENERAL INFORMATION as to Small Holdings in Great Britain.—**Cultivation and Conditions on which they will be provided.**—The attention of those who are making application for small holdings under any of the above heads is directed to the following points :—

That the experience of the Boards of Agriculture and the Small Holdings Committees has shown that small holders have, in most cases, been highly successful in the past,† and under conditions which were much less favourable for success in agriculture than those which are likely to obtain for many years to come. But, as many of those who have been serving at the front in France and Belgium must have observed, the system prevailing in those countries of intensive cultivation or *petite culture* depends for its success on the skill, hard work and energy displayed by the small holder himself, assisted by the members of his family. Ex-Service men are, therefore, advised, before they send in an application for a small holding,

* Not reproduced here.

† See also note on p. 1215.

to consider their prospects carefully, and to assure themselves that they possess the necessary qualifications, industry and determination to enable them to carry through in an occupation which, whilst affording many advantages, must by its very nature be subject to occasional disappointments through unfavourable seasons and other causes over which they can exercise no control. Further, every man should make sure that his wife, if he has one, is ready to share the conditions of rural life, and that she is prepared to assist him in many of the minor operations on the holding.

One word of special caution is necessary. Many men think that *poultry keeping* is a remunerative business which offers a suitable opening for those who desire to settle on the land. The Boards think it necessary, therefore, to state definitely that in their opinion poultry keeping cannot be recommended as a staple occupation. It is a useful side-line, but ex-Service men would be most unwise to rely upon it as a means of making a living.

The attention of those who desire to settle upon the land is directed to the different types of farming which may be undertaken by a small holder.

(a) **Mixed Farming.**—The tenants on this class of holding grow corn and other crops in rotation, rear stock, and are, in fact, small farmers. It will usually be found that a holding of 30 acres and upwards is necessary to enable a man to maintain himself and a family, but the area suitable for a successful small holding of this type necessarily varies very much with the nature of the soil and the system of farming practised.

(b) **Dairy Holdings.**—As a rule it will be found that a holding of from 30 acres and upwards is similarly required to maintain a man and his family where this class of farming is followed. Experience has shown that farms of this nature are most profitable where, in addition to the pasture, a certain proportion of the holding is utilised for the growth of root and forage crops. Dairying on holdings, consisting mainly of arable land on the "soiling system," which entails the systematic growth of forage crops and roots, is being developed and is likely to prove of great advantage to the small holder. It should be borne in mind that, unless the milk is to be sold off the holding, the small holder's wife should possess a knowledge of dairying in all its branches.

(c) **Fruit and Market Gardening.**—Land suitable for this type of holding is not to be found in every district. Where it can

be acquired this type of cultivation offers great advantages to a man who is determined to succeed, but it also requires a considerable amount of technical knowledge in respect of the growth and marketing of fruit and vegetables. In suitable localities where the soil and climatic conditions are favourable and there is a ready means of access to good markets, holdings of this kind may be of much smaller size than in the two cases already mentioned. Under favourable conditions where an intensive system of culture has been adopted there are numerous instances of successful undertakings on holdings of from 3 to 5 acres.

The ex-Service man who obtains a holding will be expected to undertake to cultivate it himself, the word "cultivate" meaning the use of the land for any purposes of farming or husbandry, including market gardening and fruit farming. He must not get a holding and then use it for some other purpose; his rent will be fixed at a rate which will repay the cost of acquiring the land and making it ready for his use, except that the Government propose to bear the extra cost due to the abnormal price of building at present. He will have to pay the local rates himself, and also the tenant right valuation or sum due to the outgoing tenant on entering.

Past experience has shown that most small holders prefer to rent their land in order that the capital they possess may be turned over rapidly in the cultivation of their holdings, and that the small holding may be more readily used as a stepping stone to a larger holding. If, however, a man wishes to buy a holding from a County Council, he can do so by paying one-fifth of the cost of the land and its equipment in cash. Thus if a holding should cost, say, £200, he would pay down £40, and the Council would allow him to pay off the remainder of the cost, £160, in the following way: He could pay a yearly rent for one-quarter of the balance, £40, and he could pay off three-quarters, £120, by half-yearly payments spread over a period up to 50 years, such payments to cover the interest on the amount still owing. In return for the assistance given him, a small holder would undertake not to use his holding for any purpose other than that of agriculture, as described above, for at least 20 years, and in any case not until the whole amount had been paid off.

CO-OPERATION.—Under the new conditions which have been introduced owing to the War, co-operation has been resorted to in many localities where it was previously unknown, and

there is good evidence that the principle will be greatly extended to benefit small holders, and particularly those who are engaged in fruit farming, market gardening and dairying. Co-operation, on the one hand, embraces the co-operative purchasing of such things as fertilisers, seeds, feeding-stuffs, etc., and, on the other hand, the co-operative transport and marketing of produce.

In making the choice between an agricultural or any other pursuit on demobilisation the ex-Service man is reminded that, as a consequence of the immensely increased interest in the production of home-grown food, associations for the betterment and brightening of village and rural life have been started, and that the Government is closely studying how the welfare of the agricultural population can be improved by better housing and the encouragement of rural industries.

Finally, there is every evidence of an earnest desire amongst the landowners of the country to assist the Government as far as possible by offering special facilities to ex-Service men who desire to take up any form of agriculture or agricultural employment in the Home Country. It must, however, be understood, that, whilst every effort will be made to accommodate those who are genuinely desirous of taking up farming on small holdings as a means of livelihood with the best will in the world on the part of all concerned, some little time must elapse before the whole area of land can be acquired to meet the probable demand from ex-Service men. Moreover, where new cottages and the necessary outbuildings have to be erected, this delay may be increased in consequence of the great shortage of building materials and of the absence of so many men belonging to the building trade on military service. Thus in some cases it may be necessary for men to find temporary employment on a farm until a holding has been secured and equipped for them.

DISABLED MEN.—If a man is disabled through wounds or through illness contracted whilst on active service of such a kind as to prevent him following his previous occupation, he should apply to his Local Pensions Committee for training in agriculture, as the Ministry of Pensions hope to make arrangements in appropriate cases to assist such men.

A SUCCESSFUL METHOD OF GROWING HEAVY CROPS OF WHEAT.

ARTHUR AMOS, M.A.,

School of Agriculture, Cambridge.

WHEN corn crops are grown upon rich land the factor which most frequently limits the yield is the inability of the straw to hold up the ears ; if the straw fails to stand the crop becomes laid, is very difficult and expensive to harvest, the ears never fill, and the yield is disappointing. This unfortunate result is very liable to be obtained when a wheat crop is taken upon land in such a high state of fertility as is commonly attained upon market-garden land, or upon grubbed hop land, or, again, on some of the Fen lands of the Eastern Counties.

The following characteristics are generally to be observed in the growth of wheat crops under such conditions. The crop, having been sown in October or November, germinates and begins to grow well during late autumn, its vigour is continued during the winter, and in March the crop generally looks magnificent—a dense carpet of vigorous green foliage. The experienced farmer is anxious ; he knows that his crop is “ winter proud ” and that it is unlikely to look so well during the rest of the growing period. In April and May the foliage often loses its good colour ; a closer examination shows that the leaves at this stage are covered with rust, which weakens the plant and the straw ; nevertheless the stems shoot up tall and rank, only to be beaten down flat by the first thunder-storm in July.

In general practice the methods adopted to prevent this unfortunate condition are : (1) To delay sowing till late in autumn, so that the plant cannot make so much winter growth, a practice which may result in a thin plant owing to damage by rooks and killing of the tiny plants by frost, etc. ; (2) To harrow and roll the crop in spring in order to ensure a firm roothold. With such “ winter-proud ” crops, however, especially in rainy springs, growth is often so far advanced, and the stems are so tall before rolling can be accomplished, that this act may flatten down and permanently bend the stems, in which case the latter are made weaker than before. (3) One other modification of practice is possible, namely, to feed off the crop with sheep in the spring, a practice which is “ as old

as the hills," but not so commonly used as in former times. The following account describes the conditions under which this practice has been successfully adopted by my father, Mr. Alfred Amos, at Wye, Kent, and the good results obtained during the past season:—

Conditions of Soil, etc.—The land upon which the farm is situated consists of a brown loam over 6 ft. of brick earth; the texture would generally be described as friable, though sticky when wet and very retentive of water if recently moved, so that the folding of roots during winter is generally attended with disaster both to the sheep, which become rheumatic, and to the texture of the soil. When properly cultivated, however, and especially because of its high content of organic matter, the soil is friable. All the farm has been under-drained during the last 30 years, so that surplus water can be quickly evacuated from the soil. Within the last 20 years all the land under discussion has been cropped with hops. In normal practice the hop crop receives each year a coat of farmyard manure or its equivalent in some other organic manure, in addition to other artificials, so that the amount of accumulated fertility in the land, after the hops are grubbed up, is very great. Since the grubbing of the hops, and especially during the War, the land has been largely used for potatoes and other market-garden crops; these have also received ample manure, so that the fertility of the soil has not been allowed to fall much below its previous state of fertility. Three fields on the farm were sown with wheat during the past season. The first field was hops in 1914, and has since produced 10 tons of potatoes in 1915, 64 bush. of wheat in 1916, and two heavy cuts of clover hay and a third cut for silage in 1917. The second field was cropped with cabbages in 1917; these were cut for the London market during the spring and summer and the residue folded in autumn to fatting-sheep, which received in addition some linseed cake and weathered peas. The third field carried a heavy crop of beetroot, which was well manured; the beetroot was dug in October.

Tillage.—As soon as possible after the crops were removed the fields were ploughed with the Kent type of plough to a depth of about 8 in. This is considerably deeper than would be considered correct by most wheat growers, because deep ploughing makes it difficult to consolidate the furrow on the subsoil and the wheat is therefore liable to become "root-fallen." The Kent plough, however, is capable of accomplishing very

perfect work and is designed to turn the furrow almost completely upside down, at the same time breaking off the upper edges so that the turned furrow resembles a hare's back. Immediately following the plough a narrow-wheeled cart was drawn by a horse walking in the open furrow, in such a way that one wheel followed in the crease between the second and third furrows; this wheel causes the far side of the second furrow, which is left somewhat loose by the plough, to be pressed tightly upon the subsoil, and thus prevents the wheat becoming "root-fallen." The effect of this pressure by the cartwheel is exactly the same, and, indeed, more efficient than the furrow press which is used largely in Hampshire and neighbouring counties.

In the writer's view, this depth of ploughing (8 in.) is not essential to the practice, provided the land is deeply ploughed for occasional root crops, in which case the soil below the recently-ploughed furrow will allow easy penetration for the wheat roots. Nevertheless, such deep ploughing does ensure a deep range for the wheat roots.

The wheat seed is broadcasted over the land in the afternoon of each day after the ploughing and "cart-wheeling."

With this method, in the event of rain, the surface does not become wet and sticky before sowing. The greater part of the seed falls into the wheel tracks, where it is covered in by harrowing twice in the direction of the furrow. If the soil is sufficiently dry after the whole field is sown, it is cross harrowed to help break the furrow and to cover the seed more completely. The wheat is planted as early in October as the other work of the farm will allow, because, not only is less seed required, but the land is generally drier and more friable, and the plant gets well established before the advent of winter frosts. If the seeding is carried out in October, 7 pecks of seed per acre are sufficient, but 8 to 10 pecks are commonly sown if seeding is delayed till November or December.

Sheep-folding in Spring.—At the end of March, or early in April, as soon as the ground is dry enough, the wheat, having grown rankly and produced a thick foliage, is fed bare by sheep.

The ground is not close folded, since in rainy weather the sheep would tread the wet ground and spoil the texture, but the sheep are given the run of a large piece which they feed down in a week or ten days, and thus in the event of wet weather, having a wide run, they do not seriously damage the texture, though of course they must be temporarily taken off the field if the land becomes very muddy. When the wheat is fed off in this way the sheep at first consume the foliage irregularly, and it is a matter of great importance to keep the sheep on the wheat until the field is uniformly bare: this ensures that as soon as the sheep are removed the crop will shoot again regularly over the whole field.

Feeding with sheep may be continued until the end of April, but it is not advisable to continue later.

Benefits of Folding.—The benefits derived from this folding are numerous:

(1) The treading of the sheep presses and consolidates the ground as no roller is able to do, for it gives just as much pressure in the hollows

as upon the ridges in the field and so obliterates loose spaces in the seed bed. (2) The sheep in grazing remove all the rank and often somewhat rusty foliage which would develop into long, weak stems. (3) The plant, having perforce to shoot again so late in the season, has not sufficient length of time to develop a very long straw, but, on the contrary, develops a dense crop of short, vigorous and healthy stems, which eventually carry full ears, while growth proceeds without a check, and the ears ripen full of grain.

If the surface of the land is uneven after the folding, and for the sake of aerating the soil, the field may be rolled and harrowed.

It should be distinctly understood, however, that sheep folding is not desirable on any crop of wheat which will stand without folding, and that the folding of such a crop will inevitably reduce the crop.

Variety.—It is important to select a variety of wheat for this purpose which possesses certain desirable qualities. The variety actually used by Mr. Amos was Yeoman, one of Professor Biffen's new varieties resulting from a cross between Browick and Fife. This variety is one which branches or tillers well and so produces a great number of stems and ears. It produces a short, stiff straw which stands well; this is very important, for even after the folding on such rich land the straw grows fast and tall so that a weak-strawed variety is likely to be laid. Any other variety which possesses these two characteristics, and is in other respects a good wheat, is likely to give satisfactory results.

Manuring.—No artificial manure was given to the wheat crops, but the sheep, fattening on the cabbage, were fed with cake and peas, and dropped their dung on the land. The residues from the manures applied to previous crops were otherwise more than sufficient for the needs of the wheat.

Results.—The following table gives the threshing results of the three fields of wheat harvested in 1918:—

Field No.	Previous Crop.	Date of Seeding.	Date of Folding.	Area. A. r. p.	Crop	
					Total Crop. bush.	per Acre. bush.
I.	Clover	1st Nov.	Until 24th April	.. 15 2 22	1128	72
II.	Cabbage	1st Dec.	Until 17th April	.. 7 3 39	604	76
III.	Beetroot	20th Nov.	Not folded	.. 3 2 8	340	96

The area in each case represents the cropped area and does not include boundary fences or roads. The total crop per acre includes "tail" corn, which in each case was rather high, amounting to about one-eighth of the whole. The wheat was weighed off at 63 lb. to the bush.

The appearance of all the fields at harvest was extremely fine. Field No. I. after clover, which grew very rankly in

FIG. 1.—Crop of wheat on Mr. Alfred Amos' Farm.

FIG. 2.—The crop of wheat referred to in Fig. 1, cut and in sheaf.

early spring, was folded bare and the sheep taken off on 24th April; this field stood perfectly all over and produced a crop of 72 bush. per acre.

Field No. II. also grew very rankly and was folded bare on 17th April; this field did not stand so well as field No. I., but was somewhat laid in places; it produced a crop of 76 bush. per acre.

Field No. III. after beetroot was sown on 20th November, and did not grow so rankly as the two previous crops; this was natural, since the beetroot crop would have taken all available plant food from the soil up till the end of October, when it was dug. It was not, therefore, necessary to fold this wheat in the spring; the crop grew well and evenly through the summer, stood perfectly at harvest, and produced the amazing crop of 96 bush. per acre. In order that no error in measurement could arise, the field was twice measured with the chain; it was rectangular in shape and measured 1,030 links on the north and south sides and 365 links on the east and west sides.

The crop results of these fields provide striking testimony for Yeoman, and, since the wheat greatly surpasses all other English wheats in "strength" of flour, it should have a great future.

Methods to Replace Folding.—It is interesting to consider whether any other method can be devised to take the place of sheep-folding, where sheep are not available. A few years ago the writer tried the effect of cutting over a crop of wheat with a mowing machine at the end of April, but the result was not successful, the cut foliage dropped upon and partially smothered the wheat plants, and the stems did not seem to be cut sufficiently near the ground; moreover, at harvest, the wheat cut in this way did not stand better than the control plot.

My colleague, Mr. Mackenzie, carried out a small experiment on the University Farm at Cambridge this season, upon the value of cutting over a rank growth of wheat with the scythe, and I have his permission to record the result. The wheat in question was growing on the site of an old hay stack, the foliage was very rank and would certainly have become laid very early in the season. On 12th May the stems were between 2½ ft. and 3 ft. high, when they were cut with the scythe and carted to feed cows; the wheat plants immediately shot again and produced a good standing crop, which ripened about a week later than the rest of the field.

One other question arises in connection with these results. Is it possible to produce similar crops of wheat with nitrogenous and other artificial manures alone, or is the high state of fertility of the soil due to the heavy organic manuring over long periods an essential factor for success? Experiment alone can decide this point.

POTATO SPRAYING TRIALS IN THE CAMBRIDGESHIRE FENS, 1918.

F. R. PETHERBRIDGE, M.A.,

School of Agriculture, Cambridge.

AT present there are no recorded experiments on horse-drawn spraying of potatoes in the Fens to guide farmers as to the possible value of this method of spraying.

In 1897 experiments were carried out by the School of Agriculture with knapsack-sprayers on some small plots at Benwick and Littleport. The spraying mixture used was a Bordeaux mixture (10 lb. copper sulphate, 10 lb. lime, 100 gal. of water) and this was applied at the rate of about 100 gal. per acre.

The results were as follows:—

Benwick—

Date of spraying	Third week in July.
	Tons. Cwt.
Average yield per acre of three sprayed plots	8 3½
Average yield per acre of three unsprayed plots	8 3½
Gain due to spraying	0 ½

Littleport—

	Saleable Tubers.
Date of spraying	Third week in July.
	Tons. Cwt.
Average yield per acre of two sprayed plots	7 12
Average yield per acre of two unsprayed plots	6 4
Gain due to spraying	1 8 per acre.
Percentage sound saleable tubers on sprayed plots	63
Percentage sound saleable tubers on unsprayed	56

In 1898 similar experiments were again carried out at *Benwick*. The plots were sprayed with Bordeaux mixture about the middle of July. There was not much blight, but

the average increase due to spraying on 13 plots was at the rate of 1 ton 9 $\frac{3}{4}$ cwt. per acre. On the sprayed plots no diseased tubers were found, whereas on the unsprayed there were several in each sack.

Recent Trials with Horse-drawn Sprayers. — During the past season trials were made on a large scale to determine the value of spraying with horse-drawn machines in the Fens. The experiments were carried out on two fields lent by Mr. F. Hiam, Putney Hill Farm, Prickwillow, and the expenses were borne by the Food Production Department of the Board of Agriculture.

The Spraying.—The mixtures used were as follows :—

- (1) *Two per cent. Burgundy Mixture.*—This was made in 40-gal. tubs. In one tub 8 lb. of copper sulphate were dissolved in nearly 20 gal. of water ; in another tub 10 lb. of washing soda were dissolved in a similar quantity of water. The washing soda was then poured into the copper sulphate solution and the mixture well stirred. Water was then added to fill the tub, and the mixture again stirred.
- (2) *Two per cent. Bordeaux Mixture.*—This was also made in 40-gal. tubs. In one tub 8 lb. of copper sulphate were dissolved in about 20 gal. of water ; *4 lb. of lump quicklime were slaked in a bucket (Buxton lime was used). The slaked lime was made into a cream and then into a milky solution by the addition of water, and finally poured through a sieve covered with coarse muslin into about 15 gal. of water. This lime solution was then poured into the copper sulphate solution, and the mixture well stirred. Water was then added to make up the 40 gal.

Dyke water, which was fairly soft, was used for making these mixtures.

- (3) *Bordeaux Powder* was bought ready made.

The wet-spraying machine had a barrel of 100 gal. capacity. In the Fens, where many of the fields are over 20 chains long, a barrel of at least 80 gal. capacity is necessary as this quantity is only just sufficient to go up the field and back. The machine sprayed 5 rows at one time and carried the usual 3 nozzles for each row. About 100 gal. of the spraying mixture were applied per acre.

The Bordeaux powder was applied by means of a " Herrod's Dry Sprayer " at the rate of about 30 lb. per acre.

At the time of spraying the haulm of the potatoes was very high and was pressed down by the horse and machine, and

* For the first spraying this quantity was sufficient, but at the second spraying rather more than 4 lb. were necessary in order to combine with all the free copper.

it was thought that the damage might possibly be negative to a large extent the good likely to accrue from the spraying. In a few days however, it was impossible to see where the machine had been as the tops recovered their upright position. In spite of the heavy rains which followed the first sprayings the wet spray stayed on the leaves very well, but much of the "powder spray" was washed off.

Harvesting.—The potatoes were dug by a spinner and picked up by women. At the first picking only "ware" was picked up. A light harrow then followed and potatoes were again picked up. A few were picked out and put with the "ware" and the remainder put into separate bags as "mids." The "ware" and "mids" were then weighed separately.

An allowance of 6 cwt. per acre was made for the final "harrowings." The "mids" consisted partly of "ware," "seed" size, some small potatoes, and some "blights." The ware was marketed and the "mids" used for feeding pigs.

Field 1.—The history of this field is as follows:—

1915	Potatoes	10 cwt. superphosphate.
1916	"	10 " "
1917	Italian Rye-grass	No manure.
1918	Potatoes	{ 20 loads farmyard manure. 10 cwt. superphosphate.

The potatoes grown consisted of the varieties King Edward and The Ally:—

King Edward.—Each plot consisted of 9 rows, 28 in. apart and 24.4 chains in length and was, therefore, just over $\frac{3}{4}$ of an acre in area.

Plot 1.—Unsprayed.

Plot 2.—Sprayed twice with Burgundy mixture, 2 per cent., on 15th July and 6th August, at the rate of about 100 gal. per acre.

Plot 3.—Sprayed twice with Bordeaux mixture, 2 per cent., as Plot 2.

Plot 4.—Sprayed twice. The first time powder sprayed with Bordeaux powder at 5.35 a.m., 11th July (heavy dew), at the rate of about 30 lb. per acre. The second time with Burgundy mixture, 2 per cent., on 15th July, at the rate of about 100 gal. per acre.

Plot 5.—Powder sprayed once at 6.57 a.m. on 7th August (light dew) with Bordeaux powder, at the rate of about 30 lb. per acre.

Plot 6.—Sprayed once on 15th July with Bordeaux mixture, 2 per cent., at the rate of about 100 gal. per acre.

Plot 7.—Powder sprayed once at 6 a.m. on 11th July (heavy dew) with Bordeaux powder, at the rate of about 30 lb. per acre.

The yields per acre are shown below :—

Plot.	Number of Sprayings.	How Sprayed.	Yield per Acre.			Lb. of "Blightings" per cwt. of Mids.
			Ware.	Mids.*	Total.	
1	—	—	T. Cwt. 11 12½	T. Cwt. 0 19½	T. Cwt. 12 11½	18
2	2	Burgundy mixture, 2 per cent., 15th July and 6th Aug.	13 18½	1 3½	15 2	11
3	2	Bordeaux mixture, 2 per cent., 15th July and 6th Aug.	13 18½	1 4	15 2½	12
4	2	Bordeaux powder, 11th July, Burgundy mixture, 2 per cent. 15th July	13 16	1 2½	14 18½	12
5	1	Bordeaux powder, 7th Aug. . . .	10 10½	0 18	11 14½	15
6	1	Bordeaux mixture, 2 per cent., 15th July	12 18	1 5½	14 3½	17
7	1	Bordeaux powder, 11th July . . .	12 7½	1 0½	13 8½	14

* An addition of 6 cwt. per acre has been made for final harrowings.

Blight was first found on 2nd August on Plots 1, 5 and 7. On 6th August it was present on every plot. (The second spraying was, therefore, given just after the blight appeared.) On 19th August, three-quarters of the tops on Plot 1 were dead; half the tops on Plot 5 and about one-third of the tops on Plot 7 were dead.

The other plots were only suffering slightly from blight. On 28th August nearly all the tops on Plot 1 were dead, 80 per cent. on Plot 5, and half the tops on Plot 7. On the other plots only about 10 per cent. of the tops were dead. On 18th September, Plots 4 and 6 showed about 20 per cent. of green in the tops and Plots 2 and 3 about 30 per cent. These plots carried a few green leaves until the end of September.

The state of the haulm is a good guide as to the value of a "spray," and it was obvious before lifting that the largest increase in yield was on the "wet-sprayed" plots. From the state of the haulm it was expected that Plot 5 would give a slightly higher yield than Plot 1. The apparent reduction in yield was not due to the spraying.

The Ally.—The plots of this variety consisted of 9 rows, 28 in. apart and 15·4 chains in length, *i.e.*, about half an acre. Unfortunately, in the first 6 rows of Plot 1 some King Edwards were planted, so that only 3 rows were weighed in this plot.

Plot 1.—Powder sprayed 6.20 a.m., 11th July (heavy dew), and 7.17 a.m., 7th August (light dew) with Bordeaux powder, about 30 lb. per acre.

Plot 2.—Powder sprayed 6.40 a.m., 11th July (heavy dew), with Bordeaux powder, about 30 lb. per acre.

Plot 3.—Unsprayed.

The yields per acre were as follows:—

Plot.			Ware.		Mids.*		Total.	
			T. Cwt.		T. Cwt.		T. Cwt.	
1	10	16	1	10	12	6
2	10	12	1	8½	12	0½
3	9	18	1	8	11	6

The percentage of blighted tubers was about the same as in the King Edwards. Blight was found on all three plots on 2nd August, and spread more rapidly than in the King Edwards. Three-quarter of the tops of Plot 3 were killed by 14th August, about ½ of Plot 2, and about ¼ of Plot 1. The tops of Plot 3 were nearly all dead on 19th August, and those of Plots 1 and 2 by the end of the first week in September.

Plot 1 always looked rather better than Plot 2.

Field 2.—The history of this field is as follows:—

1913	Celery	20 loads of farmyard manure, plus 5 cwt. superphosphate.
1914	Potatoes	8 cwt. superphosphate.
1915	"	10 " "
1916	Onions	3 " "
1917	"	3 " "
1918	Potatoes	10 " "

Evergood.—Each plot consisted of 9 rows, 28 in. apart and 22.8 chains long and was, therefore, rather less than ¾ of an acre in area.

Plot 1.—Unsprayed.

Plot 2.—Sprayed twice with Burgundy mixture, 2 per cent., on 15th July and 6th August, at the rate of about 100 gal. per acre.

Plot 3.—Bordeaux mixture, 2 per cent., as Plot 2.

Plot 4.—Powder sprayed once at 4.15 a.m. on 11th July (heavy dew), with Bordeaux powder, at the rate of about 30 lb. per acre.

Plot 5.—Sprayed once with Burgundy mixture, 2 per cent., on 15th July, at the rate of about 100 gal. per acre.

Plot 6.—Sprayed once with Bordeaux mixture, 2 per cent., as Plot 5.

Plot 7.—Powder sprayed twice at 4.45 a.m. on 11th July (heavy dew), and at 6.25 a.m. on 7th August (light dew), with Bordeaux powder, at the rate of about 30 lb. per acre.

Plot 8.—Powder sprayed twice at 6.20 p.m. (no dew), 15th July, and at 5.45 p.m., 6th August (no dew), with Bordeaux powder, at the rate of about 30 lb. per acre.

Plot 9.—Unsprayed.

* An addition of 6 cwt. per acre has been made for final harrowings.

The yields per acre are shown below :—

Plot.	Number of Sprayings.	How Sprayed.	Yield per Acre.		
			Ware.	Mids.*	Total.
1	—	—	T. Cwt. 15 18½	T. Cwt. 1 7½	T. Cwt. 17 6½
2	2	Burgundy mixture, 2 per cent., 15th July and 6th Aug. ..	Carted by mistake before weighing.		
3	2	Bordeaux mixture, 2 per cent., 15th July and 6th Aug. ..	18 6½	1 9½	19 16
4	1	Bordeaux powder, 11th July (dew)	15 12	1 6	16 18
5	1	Burgundy mixture, 2 per cent., 15th July	16 7	1 8	17 15
6	1	Bordeaux mixture, 2 per cent., 15th July	17 3½	1 4½	18 8
7	2	Bordeaux powder, 11th July (dew) and 7th Aug. (dew) ..	16 4½	1 10	17 14½
8	2	Bordeaux powder, 15th July (no dew) and 6th Aug. (no dew)	16 0	1 5½	17 5½
9	—	—	15 10	1 6	16 16½

* An addition of 6 cwt. per acre has been made for final harrowings.

Very few of the tubers were badly blighted. About 3 to 6 lb. of blights were found per cwt. of "mids" and a few blighted tubers were put in with the ware.

At the time of the second spraying the tops were so intergrown that it was difficult to keep the machine in the rows.

Blight was first noticed on 2nd August on Plots 1, 4 and 9, and on 6th August was found on all plots. On 19th August nearly half the tops on Plots 1 and 9 were killed, about a quarter of the tops on Plots 4 and 8, 15 per cent. on Plots 5 and 7, 7 per cent. on Plot 6, and 5 per cent. on Plots 2 and 3. The tops of Plots 1 and 9 were killed off early in September, whereas Plots 2 and 3 did not die off until nearly the end of the month. The order of yield as estimated from the haulm was as follows :—Plots 3—2—6—5—7—4 and 8—1—9.

Cost of Spraying.—The cost of spraying 1 acre of potatoes once with 2 per cent. Bordeaux mixture is as follows :—

	s.	d.
20 lb. copper sulphate	11	0
10 lb. lime	0	3
3 men and one horse do an average of about 5 acres per day	5	0
Wear and tear of machine, etc.	1	6
Total per acre	17	9

Before the War the cost was about half the above. Where water has to be carted long distances the cost may be considerably higher.

An examination of the foliage after spraying showed that many of the leaves were not covered by the spraying mixture. Most of the machines on the market at the present time apply only about 100 gal. per acre and are not very suitable for covering the large haulms, which are usually found on black Fen land. In order to cover large tops it is necessary to apply at least 200 gal. per acre and it seems probable that the present machines could be improved by being provided with larger pumps and by the addition of an extra pair of nozzles per row about 10 in. above the present pair of nozzles. It is hoped to try this type of machine next season.

The chief faults of those Fen growers who spray their potatoes seem to be :—

- (1) Spraying too early. Some of the fen growers make two applications before the middle of July.
- (2) The use of spraying mixtures not so effective as home-made Bordeaux or Burgundy mixture.
- (3) The use of dry or powder sprays. This is in favour with many growers because it is economical of labour, enables large areas to be sprayed quickly, and water is not always handy for wet spraying. Dry spraying has practically been given up in Ireland in favour of wet spraying, and in the above experiments dry spraying was not nearly so profitable as wet spraying.

Some Fen growers object to spraying on the ground that a large percentage of the crop becomes blighted. This was not so in the above experiments, but in cases where the unsprayed crop is killed off quickly and the sprayed crop killed slowly by blight it is possible that a larger percentage of "blights" would be found in the sprayed crop, but even in this case the extra yield might make the spraying a profitable investment.

The value of spraying cannot be decided from the results of one particular season, but from those of a succession of seasons.

POTATO GROWING ON WASTE LAND IN DORSET.

IN the autumn of 1917 an arrangement was made to break up and utilise for potato growing some 8 acres of waste land on Mr. R. S. Hunt's farm, situated on the Bridport Road, near Dorchester. The land in question was covered with gorse and rough undergrowth to such an extent as to render it unsuitable for use for grazing purposes.

The experiment was put into the charge of Captain Barton, who secured German prisoner labour, and commenced operations by cutting and burning the gorse. The turf was then stripped off and buried, and the ashes from the burnt gorse were spread over the land, thus adding a useful amount of potash. The whole work of clearing and bastard trenching was carried out by hand, and no mechanical labour of any kind was used.

The soil was light loam on chalk, and although no natural or artificial manure was added, with the exception of the ashes from the burnt gorse, an excellent crop of potatoes was lifted. There is no doubt that this was largely due to the bastard trenching. Irish seed, chiefly Up-to-Date, with some British Queen and Arran Chief, was planted. It was, however, of inferior quality, and was affected with superficial mechanical scab. As there was considerable delay in obtaining delivery of the seed, there was no time to sprout it, and the sets were therefore planted direct from the sacks on 4th May, the planting distance being 30 in. between the rows and 15 in. between the sets. The work was carried out by hand, drills being drawn out by a mattock. The sets were only planted 2 to 3 in. deep, and were subjected to very dry weather directly after planting; if they had been planted from 4 to 5 in. deep, the crop would doubtless have been heavier. Hoeing was carried out once, and the young plants were then earthed up.

Spraying operations were started on 26th June, and the whole area was sprayed twice, the ground being covered at the rate of about $\frac{3}{4}$ -acre per day. On one or two patches the second spraying was not started until after the disease had appeared on the new foliage, and though in these instances the spread of the disease was arrested, the final results were not as good as those from the areas that had been sprayed in good time.

Captain Barton exercised considerable ingenuity in having an old Army whitewashing machine converted by the camp blacksmith, to make it suitable for potato spraying. The

machine was somewhat heavy and cumbersome, but answered the purpose admirably. A powerful pump, worked by a hand lever, was used, and applied the fluid in the form of a very fine mist. It was only found necessary to spray the undersides of the leaves, as a sufficient quantity of the mixture "fell back" to coat the upper surfaces. A certain amount of damage was caused to the haulm by the long lengths of hose attached to the machine, and its height above the ground rendered it slightly top-heavy.

The small hand manual, illustrated, is more practical than Captain Barton's machine, and should prove of value to small holders, local councils, and allotment associations, where any considerable acreage of potatoes has to be sprayed. The hose pipes, however, should not exceed 10 to 12 ft. in length, or damage may be caused to the haulm.

Practice has shown that these machines can easily be worked by four women—two to manage the hoses and lances, one to push the machine, and one to mix the chemicals, carry water, and to keep the machine supplied.

When lifted in September the crop averaged 10 to 12 tons to the acre, reflecting the greatest credit on all concerned, and showing what good results can be obtained from derelict land.

Thanks are due to Colonel Bulkeley, the Commandant of the Prisoners of War Camp, Dorchester, for permission to prepare this report, and it is hoped that he will see his way to develop more derelict land in the same efficient manner in the future.

Spraying Experiments.—In addition to the valuable work described above, Captain Barton kindly made arrangements whereby the Food Production Department's sub-organiser for spraying for Dorset was enabled to conduct spraying trials on 1 acre of the reclaimed land. Nine rods were left unsprayed as a control and the remainder was sprayed by means of knapsack machines, a large automatic horse-drawn sprayer, and a powder sulphurator.

The experimental ground was situated 442 ft. above sea level, and the position was very open and exposed to winds. Irish Up-to-Dates were used on all the plots, and the sets were planted straight from the sacks on 4th May. The planting distances in all cases were as follows: (a) between the rows, 30 in.; (b) between the sets, 15 in.; and (c) depth, 3 in.

The rows ran north and south, and the plants were earthed up once, on 10th June. The weather was fine and dry immediately before spraying, except where a dry powder was used. In this case the weather before the application was very wet.

FIG. 1.—The land as it appeared before operations were commenced.

FIG. 2.—German prisoners at work clearing the land of gorse and undergrowth.

FIG. 3.—Bastard trenching.

FIG. 4.—Spraying with a converted whitewashing machine.

FIG. 5.—A small hand manual machine which was found far more efficient and easier to work than Captain Barton's machine.

Plot 1.—Two sections, each measuring 9 rods, were selected, and section A was left unsprayed as a control. Section B was sprayed with 1 per cent. Burgundy mixture on 1st July, and again on 29th July. Slight signs of disease were noticed on the control plot on 8th August, and by 12th August the blight was general. On Section B only a few leaves had been affected by 26th August.

The crops were lifted on 7th October, and the weights were as follows :—

<i>Total Weight of Tubers. Per Acre.</i>			<i>Weight of Healthy Tubers. Per Acre.</i>			<i>Weight of Blighted Tubers. Per Acre.</i>		
lb.	T. cwt.		lb.	T. cwt. lb.		lb.	T. cwt. lb.	
A 1,338	= 10 12 ..		1,074	= 8 10 53 ..		264	= 2 1 59	
B 1,362	= 10 16 ..		1,284	= 10 3 91 ..		78	= 0 12 43	

Plot 2.—This was a test between 1 per cent. and 2 per cent. Burgundy mixture. Section A on Plot 1 again formed the control. Plot 2 was divided into two sections, each 9 rods in area. Section B was sprayed on 1st July, and again on 29th July, with 2 per cent. Burgundy mixture, and Section C with 1 per cent. Burgundy mixture on the same dates. The blight was general on the control plot on 12th August; on Section B on 29th September, and on Section C on 19th September.

The crops were lifted on 7th October :—

<i>Total Weight of Tubers. Per Acre.</i>			<i>Weight of Healthy Tubers. Per Acre.</i>			<i>Weight of Blighted Tubers. Per Acre.</i>		
lb.	T. cwt.		lb.	T. cwt. lb.		lb.	T. cwt. lb.

B 1,544	= 12 5 ..		1,511	= 11 19 94 ..		33	= 0 5 27	
C 1,362	= 10 16 ..		1,284	= 10 3 91 ..		78	= 0 12 43	

Plot 3.—In this case 1 per cent. Burgundy mixture was again used, but only one application was given, and that was on 29th July. Disease was general on the control plot on 12th August, and on Plot 3 on 9th September.

The weights on 7th October when the crops were lifted, were as follows :—

<i>Total Weight of Tubers. Per Acre.</i>			<i>Weight of Healthy Tubers. Per Acre.</i>			<i>Weight of Blighted Tubers. Per Acre.</i>		
lb.	T. cwt.		lb.	T. cwt. lb.		lb.	T. cwt. lb.	
A .. 1,338	= 10 12 ..		1,074	= 8 10 53 ..		264	= 2 1 59	
Plot 3 1,635	= 12 19 ..		1,545	= 12 5 27 ..		90	= 0 14 32	

As disease started late this year, very little difference could be noticed between Section B on Plot 3, and Section B on Plot 1, which was sprayed on 1st July as well.

Plot 4.—Nine rods were sprayed on 1st July, and again on 28th July with 1 per cent. Burgundy mixture. On this plot

the soil was more productive, and the haulm therefore stronger; this probably accounts for the increased weight both of healthy and diseased tubers.

The Control Section A was generally affected by blight by 12th August, whilst Plot 4 was not so affected until 9th September.

The crops were lifted on 7th October :—

	Total Weight of Tubers.			Weight of Healthy Tubers.			Weight of Diseased Tubers.		
	Per Acre.			Per Acre.			Per Acre.		
	lb.	T. cwt.	lb.	T. cwt.	lb.	T. cwt.	lb.	T. cwt.	lb.
A ..	1,338	= 10 12	..	1,074	= 8 10 53	..	264	= 2 1 59	
Plot 4	1,459	= 11 11	..	1,354	= 10 14 103	..	105	= 0 16 75	

Plots 5 and 6.—The object of this trial was to test as far as possible the relative merits of horse-drawn machines and knapsack sprayers. The area was too small to be a fair trial of horse-spraying, and for various reasons it was found impossible to complete the trial with any amount of accuracy.

Plot 7.—Left unsprayed.

Plots 8 and 9.—This trial was of especial interest as a new proprietary article was being tested. This powder was found to be readily soluble in cold water, and the precipitate remained colloidal for several hours after mixing. Three sections of $4\frac{1}{2}$ rods each were chosen and Section A was left unsprayed to act as the control; Section B was sprayed with a wash made from the proprietary powder on 3rd July, and again on 29th July; and Section C was sprayed with 1 per cent. Burgundy mixture on the same dates.

The blight was general on the control section on 12th August, and on Section C on 9th September, while Section B was not generally affected until 17th September.

The crops were lifted on 24th October :—

	Total Weight of Tubers.			Weight of Healthy Tubers.			Weight of Blighted Tubers.		
	Per Acre.			Per Acre.			Per Acre.		
	lb.	T. cwt.	lb.	lb.	T. cwt.	lb.	lb.	T. cwt.	lb.
A 669	= 10 12 42	..	537	= 8 10 53	..	132	= 2 1 101		
B 819	= 13 0 0	..	813	= 12 18 11	..	6	= 0 1 101		
C 827	= 13 2 60	..	771	= 12 4 85	..	56	= 0 17 87		

Mr. Mackenzie, the Department's representative, reported on this trial as follows :—

“ This powder made a very good mixture, the precipitate of which remained well in suspension, and did not choke the nozzles of the machine. In spite of heavy rains it adhered well to the foliage, and, owing to its bright blue colour, it was easy to see if the leaves were properly coated. A third spraying would have kept the haulm perfectly immune.”

Plots 10 and 11.—Two $4\frac{1}{2}$ -rod sections were selected and Section B was sprayed on the 4th, and again on 27th July with another proprietary article, which the makers claim may be used for either wet or dry spraying. Section C was sprayed on the same dates with 1 per cent. Burgundy mixture. Blight was general on the Control Section A on 12th August, and on Sections B and C on 9th September.

The crops were lifted on 29th September :—

<i>Total Weight of Tubers. Per Acre.</i>				<i>Weight of Healthy Tubers. Per Acre.</i>				<i>Weight of Blighted Tubers. Per Acre.</i>			
lb.	T.	cwt.	lb.	lb.	T.	cwt.	lb.	lb.	T.	cwt.	lb.
A 669 =	10	12	0 ..	587 =	8	10	53 ..	132 =	2	1	101
B 754 =	11	19	41 ..	747 =	11	17	16 ..	7 =	0	2	25
C 702 =	11	3	96 ..	691 =	10	19	41 ..	11 =	0	3	55

This proprietary article was easy to mix, but the precipitate settled very quickly to the bottom of the machine, and was very apt to cause choking of the nozzles. It was, however, found to be effective in preventing disease.

Plots 12 and 13—Two plots of $4\frac{1}{2}$ rods each were selected : the powder used on Plots 10 and 11 as a wet spray was applied as a dry powder on Section B on 15th July, and again on 3rd August. Section C was sprayed with 1 per cent. Burgundy mixture on the same dates. Section B was still green at the time of lifting.

<i>Total Weight of Tubers. Per Acre.</i>					<i>Weight of Healthy Tubers. Per Acre.</i>					<i>Weight of Blighted Tubers. Per Acre.</i>				
lb.	T.	cwt.	lb.		lb.	T.	cwt.	lb.		lb.	T.	cwt.	lb.	
A 669 =	10	12	42	..	537 =	8	10	53	..	132 =	2	1	101	
B 998 =	15	16	93	..	993 =	15	15	27	..	5 =	0	1	66	
C 1,012 =	16	1	30	..	991 =	15	14	67	..	21 =	0	6	75	

The results of this trial were satisfactory, but the ground was of a heavier nature on Sections B and C, and this probably accounted largely for the general increase in yield. Dry powders need to be applied when the leaves are moist with dew. The results of trials both in this country and in Ireland have shown the general superiority of wet sprays, but there are many allotments and farms where dry spraying could be adopted with advantage owing to the difficulty in obtaining a supply of water.

Plot 14.—Two sections of 9 rods each were selected. Section A on Plot 1 formed the control. Sections B and C were sprayed twice and thrice, respectively, with 1 per cent. Burgundy mixture ; B on 2nd July, and 31st July ; and C on 2nd July, 31st July, and 20th August.

The control was generally affected by blight on 12th August, Section B on 9th September, but Section C remained green until the crop was lifted on 24th September :—

<i>Total Weight of Tubers. Per Acre.</i>				<i>Weight of Healthy Tubers. Per Acre.</i>				<i>Weight of Blighted Tubers. Per Acre.</i>				
lb.	T. cwt.			lb.	T. cwt.	lb.		lb.	T. cwt.	lb.		
A 1,338	= 10	12	..	1,074	= 8	10	53	..	264	= 2	1	59
B 1,459	= 11	12	..	1,354	= 10	14	103	..	105	= 0	16	75
C 1,783	= 14	3	..	1,775	= 14	1	83	..	8	= 0	1	30

This trial showed very conclusively the benefits to be derived from a late third spraying.

REPORT OF THE DEVELOPMENT COMMISSIONERS FOR THE YEAR ENDED 31st MARCH, 1918.

THE Report of the Development Commissioners for the year ended 31st March, 1918, has just been issued. Copies may be obtained from H.M. Stationery Office, Imperial House, Kingsway, London, W.C. 2, price 3*d.* net. It is stated that except so far as the special circumstances of the War have called for extended expenditure or new schemes in respect of food supply and natural products, or for the preliminary outlay in the preparation of schemes which may employ labour after the War, the Commissioners have continued the policy which they have adopted since the commencement of the War of confining their advances in the main to ensure the continuity of schemes which were already in working in 1914, and which cannot properly be discontinued. In one instance, that of flax growing, the expansion owing to War needs has led to an increase of the undertaking to a scale on which it is no longer of an experimental or educational nature, such as is appropriate for assistance from the Development Fund, and the undertaking has accordingly been taken over by the Board of Agriculture.

Extra expenditure on a largely increased supply of plants for afforestation has been continued. An advance of £6,905 to the Commissioners of Woods for this purpose has been recommended; while in Scotland, in addition to ordinary expenditure, grants of £2,000 for each of the financial years, 1917-18 and 1918-19, were recommended to meet expenditure on the establishment of forest nurseries, and £930 for an additional Forest Officer on the staff of the Board of Agriculture. A sum of £1,000 was also made available for preliminary arrangements for the afforestation of privately owned lands and a flying survey.

Agricultural Research and Education, etc.—(i.) General.—The Commissioners explain in their Report the new method they have adopted for financing the scheme for the development of

agricultural research at universities, colleges, etc., and the extension of advisory and local investigation work. The scheme includes provision for the encouragement of individual workers in agricultural science outside the field covered by the Research Institutes, and the Commissioners have annually recommended a grant not exceeding £3,000 for this kind of work in England and Wales, and small grants for work in Scotland. The Commissioners originally contemplated a maximum grant of £5,000 for the whole United Kingdom, to be allocated on the advice of a Committee representing Scotland and Ireland, as well as England and Wales, and suggested that the English Board's Advisory Committee on agricultural science might be enlarged for this purpose by the addition of representatives nominated by the Agricultural Departments for Scotland and Ireland. An agreement has now been reached under which the three Agricultural Departments will co-operate for this purpose. The English Board's Advisory Committee has been dissolved and the Commissioners have set up a Committee of their own, including representatives of the three Departments, to report to them on applications for "Special Research" grants, and on such other subjects as the Commissioners may refer to them. The Commissioners are prepared to consider, and, if they are satisfied with the applications supported by the new Committee, to recommend an annual grant, not exceeding £5,000, for the assistance of special research schemes in the United Kingdom.

(ii.) *England and Wales*.—The following grants to the Board of Agriculture and Fisheries have been recommended for the continuance during the financial year 1918-19 of the research scheme, and of the scheme for the development of agricultural education :—

Grants to Colleges and Institutions in aid of—		£
(a) Scientific research and experiments		*20,500
(b) The extension of advisory and local investigation work		8,500
(c) Special investigations and research, and scholarships		2,400
Enquiries and experiments, etc., by or on behalf of the Board		1,000
Expenses of administration		950
		<hr/> 33,350
<i>Less amount not payable from the Development Fund</i>		<i>2,150</i>
		<hr/> £31,200

* For details of the expenditure under this head, see this *Journal*, September, 1918, p. 718.

Research in animal pathology to be undertaken at the Board's Veterinary Laboratory, 1918-19	£ 2,000
Research Institute in Plant Pathology at Kew—	
Salaries, wages, and maintenance expenses, 1918-19..	1,411

The proposed expenditure in respect of the grants for Research Institutes and Advisory Centres contemplates, as a rule, only the carrying on of existing work ; but slightly increased grants as compared with those given last year have been sanctioned for three Institutes to carry out work which experience has shown to be desirable in the conditions brought about by the War.

Grants of £16,350 were sanctioned in aid of Agricultural and Dairy Education during the year 1918-19 to provide for—

(i.) Grants to local authorities and school managers under the Farm Institute Regulations	£ 9,500
(ii.) Grants in aid of a scheme for the encouragement of cheese-making by the establishment of Migratory and Co-operative Cheese Schools	3,000
(iii.) Administrative expenses of advisory councils established in connection with the Farm Institute and Live Stock Schemes of the Board	250
(iv.) Administrative expenses of the Board	3,400
(v.) Grant to the Seale Hayne Agricultural College for the maintenance of the College Farm for the training of women	200
	<hr/> £16,350 <hr/>

The grant made in aid of Farm Institutes represents a considerable reduction on the amount contemplated before the War for the establishment of such Institutes in England and Wales ; but building and extension schemes have been postponed by Local Education Authorities until the end of the War, and the reduced grant is required to meet the commitments under the Farm Institute Regulations.

In their last Report* the Commissioners stated that they had under consideration an application from the Board of Agriculture and Fisheries for a grant of £7,900 to meet additional expenditure on the vegetable drying and fruit preserving experiments which are being carried out in Warwickshire, under the supervision of a Committee appointed by the Board, in order to test the prospect of these industries on a commercial scale. The vegetable drying plant and premises were found to be inadequate for the purpose, and the Board, therefore, submitted provisional proposals for the purchase of a vacant factory at Chipping Campden, and (after the close of the year

* See this Journal, January, 1918, p. 1090.

to which this report relates) an advance of £11,000 was recommended for the purchase price of the factory, contents, and site, with 3 acres of land, and for removal and other incidental expenses.

A grant of £595 was made to the Imperial College of Science and Technology for the continuation during 1918 of investigations into the effect of electrical discharge on the growth of crops.

The Commissioners received an application for a grant of £100 in aid of the upkeep of the Haslemere Education Museum, but they did not consider that the work of the Museum in its bearing upon the development of agriculture could be held to justify a grant from the Development Fund, and were unable, therefore, to recommend any advance.

Eggs and Poultry.—A grant of £1,700 was recommended for the continuation on a reduced scale of the scheme for augmenting the production of eggs and poultry during the season 1917-18, by the establishment of centres in England and Wales, for the distribution of reliable eggs for hatching, stations for the distribution of day-old chicks, and the provision of incubating stations.*

Electricity for Agricultural Purposes. — The Commissioners received an application from the Chester Corporation for a grant of £200 to meet the expense of collecting data and making investigations into the practicability of utilising the water power of the River Dee, above Chester, to generate electricity to be used for agricultural purposes, and the development of rural industries. The corporation had already inaugurated with success a scheme for converting into electrical energy the low fall water power at the Chester Weir, and, after consultation with the Applied Sciences Committee of the Royal Society, the Commissioners recommended the grant. An application from the Incorporated Municipal Electrical Association for a grant of £500 in aid of the expenses of a special Committee of the Association on the development of electricity in agricultural areas was refused, as the objects of the Committee did not appear to have a sufficiently direct bearing on agriculture.

Cultivation and Preparation of Flax, Hemp, and Tobacco. — (i.) *British Tobacco Growers' Society.*—A grant of £805 was recommended in aid of the work of the Society during the year 1917-18. Experiments by the Society in the cultivation and

* See also this *Journal*, December, 1918, p. 1106.

preparation for market of tobacco in order to ascertain whether it can be grown profitably in this country had been financed for the preceding four years from the Development Fund.

The re-handling and growing are centralised at Broomhill (Norfolk), near the colony of growers. The tobacco is now grown at the cost and risk of the growers, the work of the Society being confined to collecting, re-handling, and selling the tobacco without cost to the growers, who receive the actual price realised. The growers were anxious that the continuity of the experiments should not be broken, and the Commissioners agreed with the view taken by the Board of Agriculture and Fisheries that as the experiments had not yet been brought to any definite conclusion, and the trade reported a continued improvement in the quality of the tobacco produced, it would be a misfortune if the position gained in the market were allowed to lapse. Reductions were made in administrative expenses, and looking to the small amount of land and labour required to keep the experiments alive, the Commissioners held that the reduced expense of securing the continuity was justified.

(ii.)—*British Flax and Hemp Growers' Society.*—

(a) A supplementary grant of £15,450 (in addition to the sum of £6,275 granted last year) was made for an extension of the Society's work during the year to 30th September, 1917, undertaken partly in order to ensure a future supply of material for the production of aeroplane cloth, and partly in order to increase the growth of linseed as a feeding stuff for stock.

(b) In January, 1918, the Commissioners received an application for an advance of £205,700 in aid mainly of a scheme of flax cultivation for war purposes. The sum was made up as follows :—

(i.) £5,700 by way of grant for the year ending 30th September, 1918, to continue the scientific and technical investigations into the growth and treatment of flax, and to meet the organisation and administration expenses of the Society.

(ii.) £200,000 by way of loan for the initiation of an extended programme for the cultivation of flax in Great Britain and its production into fibre.

The growing of flax for fibre on the scale contemplated carried the undertaking outside the experimental or demonstrative sphere appropriate for aid from the Development Fund, and after the application was received arrangements were made for the whole of the flax-growing work of the Society to be taken over by the Board of Agriculture and Fisheries and financed from Votes of Credit.

Grants to the Society and to the University of Leeds have been made from the Development Fund for several years past to meet the cost of experiments in the cultivation and preparation of flax. The net total advanced to these bodies from the Fund for flax and linseed schemes up to 30th September, 1917, was £28,293, and included capital expenditure on buildings, machinery and equipment of two experiment stations. The Board of Agriculture and Fisheries took over the control of these schemes as from 1st October, 1917, and it was arranged that the existing property and assets should be transferred to the Board. Under this arrangement the whole of the above-mentioned sum of £28,293 has been repaid to the Development Fund from Votes of Credit.

The Commissioners will probably continue to make small grants to the Society for certain scientific and technical experiments, and they recommended a grant of £2,150 for this purpose required during the year ending 30th September, 1918. The greater part of this grant will be covered by receipts which return to the Development Fund.

Encouragement of a Beet Sugar Industry.—In their last Report the Commissioners stated that they had recommended a loan of £125,000 for the purchase of the Kelham Estate in Nottinghamshire with a view to the establishment of the beet sugar industry in this country. The price of the estate was eventually fixed at £130,000, and the Commissioners recommended a further loan of £5,125. Of this sum £5,000 was required for the completion of the purchase price of the estate, and £125 for payment of interest on the amount of the deposit. At the close of the year the Commissioners had under consideration an application for a further loan required for payments to outgoing tenants, and for stocking, equipping and laying out the estate as a large farm, with a view to its preparation for sugar beet as the main crop.

Horse and Live Stock Breeding.—A grant of £37,500 was recommended to meet the cost during the year 1918-19 of the scheme for the improvement of heavy horses, cattle and swine, the extension of milk recording, and the employment of live stock officers at Agricultural Institutions in England and Wales*. The Commissioners have under consideration the whole question of the continuation of grants from the Development Fund in aid of this scheme after the year 1918-19, in the light of experience already gained and of the special circumstances created by the War.

* See this *Journal*, August, 1918, p. 541.

Development of Agricultural Co-operative Credit.—During the year the Commissioners received an application from the Scottish Central Land Bank, Ltd. (a non-dividend earning bank, registered under the Industrial and Provident Societies Acts), for a grant, or a loan at a low rate of interest, of £20,000 to promote the development of agricultural co-operative credit amongst small holders in Scotland. The Bank was established in July, 1914, under the direction of the Scottish Small Holders' Organisation, the greater part of the capital being obtained from one of the Joint Stock Banks in Scotland. The Land Bank accepts security from, and makes loans to, individuals formed into Local Credit Societies. Members individually undertake liability to the Bank on the familiar principle of liability limited by shares, while collectively they are all responsible to the extent of the whole borrowings of their society. The farm stock is the security for loans made, and advances by the Bank are limited to two-thirds of the value of the stock, the remaining third being raised co-operatively among the small holders. The Land Bank has already done some excellent work, but its capital is small, and the rate of interest at which money can be obtained has prevented progress. The Commissioners considered the application and offered to recommend that the Development Fund should guarantee to the Joint Stock Bank the loan repayments by the Land Bank, so far as not met from the assets of the Land Bank; the guarantee to be limited to twice the subscribed share capital of the Land Bank, and not to exceed £20,000. The Commissioners suggested that if such a guarantee were given the rate of interest charged by the Joint Stock Bank should be substantially reduced. At the close of the year negotiations were proceeding.

Organisation of Co-operation among Agriculturists in England and Wales.—Grants to the Agricultural Organisation Society in aid of its work during the year 1917-18 were recommended as follows :—

- (a) Block grants of £13,000, and
- (b) An additional sum equal to the amount of the Society's income from subscriptions and affiliation fees for the year. This sum amounted to £2,350.

The Board of Agriculture and Fisheries have also given a contribution of £2,000 from the Small Holdings Account administered by them.

The grants made from the Development Fund represent a considerable increase over those hitherto made, and were,

in fact, rather more than double the amount given in the preceding year.

The Society urged that owing to the conditions created by the War there was a great need and opportunity for increased agricultural co-operation, and informed the Commissioners that the Society had been re-organised in order to meet the situation. The Commissioners, however, had some doubt whether the time was opportune for a large extension of the Society's activities, as much of the work which would naturally fall to Co-operative Societies was being done by the County Agricultural Committees, and the fact that farmers were so much occupied with war-time calls might render the present a difficult time for the formation of new Societies. There was also the fact that the operations of the State in the control of production and sales, and arranging for the supply of machinery, seeds, fertilisers, etc., provide for many matters which would normally fall to co-operation. The Commissioners had several conferences with the Board of Agriculture and Fisheries, who expressed the view that, as a matter of policy, largely increased agricultural co-operation was necessary now on national grounds. The Commissioners considered the position as a whole, and finally agreed that a case had been made out for supporting the general lines of the application. They stipulated that an absolute condition of more support from the Affiliated Societies must be insisted upon, and that the Women's Institutes, for which a grant of about £2,000 was asked, must be excluded from the Society's application as not being a form of agricultural co-operation to be assisted upon that application. The grant was sanctioned by the Treasury on the understanding that it was to be considered as of an exceptional nature, and that the whole question of continuance of assistance would be reviewed at the earliest convenient opportunity in the light of the success attending the efforts of the reconstituted management, and that increased support must be obtained from the Affiliated Societies with a view to reducing the assistance required from public funds.

Among other conditions, the following were made by the Commissioners:—

- (a) That the Society shall be careful not to interfere in any way with the work of the constituted authorities in relation to education or food production.
- (b) That the Board of Agriculture and Fisheries shall be represented upon the Executive Committee of the Society by two nominees.

Forestry.—(i.) *General.*—During the year under review the Commissioners received the Report of the Forestry Sub-

committee of the Reconstruction Committee. Before this Sub-committee had commenced its work the Development Commissioners had set forth in a Memorandum submitted to the Reconstruction Committee the advantages of leasing and proceeds-sharing as compared with a system of land purchase. The Commissioners have always contemplated that part of the land to be afforested by direct State action must necessarily be acquired by purchase outright; but with a view to reducing as far as possible the inevitably serious expenditure on the creation of commercial forests, after careful enquiries, they proposed these alternative methods. The Commissioners observe with satisfaction that these methods have been approved by the Reconstruction Sub-committee.

In their last Report the Commissioners stated that it was not necessary for them to urge the importance of the afforestation of land at present unproductive. The experience of the War and the extensive felling of forests, both in the United Kingdom and on the Continent, have emphasised the national importance of home-grown supplies of timber. The Commissioners have continued to consider the most appropriate and economic methods of promoting the development of forestry in the United Kingdom, and urge the importance of the immediate preparation of afforestation schemes, so that they may be ready when the War is over. They have recommended grants for survey work, among other purposes, and considerable areas of land have been mapped out as suitable for planting. In their view, the preparation of definite schemes should be taken in hand at once.

The Commissioners have continued to press the adoption in Ireland of their proposals for the afforestation of privately-owned land. The Department of Agriculture addressed enquiries to such Irish landowners as they considered would be likely to adopt the proposals, and as a result various provisional offers of land for the purpose were made.

The Commissioners suggested that the Department should consider the suitability of the areas for schemes of economic forestry, and submit definite proposals in respect of those areas for which the Department is prepared to frame and carry out schemes. The Department is proceeding to give effect to this suggestion, and has informed the Commissioners that about 10,000 acres have been cleared during the last four years on private estates and on the Department's forestry lands, and may be regarded as available for emergency afforestation after

the War. The Department has 750,000 seedlings in hand. In addition there will be the product of the sowings in the season of 1918.

Representatives of the Commissioners visited Ireland in September, 1917, for the purpose of inspecting land suitable for afforestation and the results of work already being financed from the Development Fund.

A further matter of importance, to which the Commissioners have given attention, is the provision of nursery stock in case there should be a deficiency when the War is over, and planting operations on a large scale will become imperative. The grants recommended for this purpose are mentioned below. At the close of the year the Commissioners had just received and were considering a provisional application for a grant required for the purchase of additional seed for use by the three Agricultural Departments responsible for the carrying out of State forestry schemes in the United Kingdom. For this purpose a recommendation, which fell outside the year now under review, was made for a grant of £4,400.

(ii.) *England and Wales*.—A grant of £5,000 to the Board of Agriculture and Fisheries was recommended for the continuation in the year 1918–19 of the scheme for research, forestry instruction and advisory work at four centres in England and Wales, minor forestry experiments and surveys.

Application was made by the Board for a grant of £1,500 from the Development Fund with a view to the formation of a statistical section in the Board's Forestry Branch to collect and correlate the data afforded by the fellings which are now taking place. The Commissioners were in complete agreement with the Board as to the importance and urgency of securing and analysing the information with a view to afforestation after the War, but it did not appear to them that the constitution of a statistical section at the Board for this purpose was an object properly to be charged upon the Development Fund.

The Commissioners have continued to give attention to the provision of forest-tree seedlings in case there may be a shortage after the War, when replanting on a large scale will be imperative, having regard particularly to the extensive areas of timber which have been felled during the War. Grants to the Board of Agriculture and Fisheries and the Commissioners of Woods for the provision of nursery stock have been made from the Development Fund during the past three years, and it is estimated that 40,000,000 seedlings were produced by the close

of the 1917 season. About one-third of the total growing stock is immediately available for the afforestation of some 5,000 or 6,000 acres. An application was received from the Commissioners of Woods for a grant of £6,905 in order to meet expenditure in the year 1917-18. It was arranged to line out all the seedlings, raised both by the Commissioners of Woods and the Board of Agriculture, in nurseries under the control of the Commissioners of Woods, who will in future undertake the whole of the operations in connection with the raising by the State of emergency plants in England and Wales. The grant applied for was recommended.

A grant of £200 was also made to the Commissioners of Woods towards the cost of the maintenance during 1917-18 of the Forest of Dean Demonstration Area, on the condition that the Land Revenues of the Crown continue as hitherto to bear the cost of general improvements and maintenance of Dean Forest and adjoining woodlands.

(iii.) *Scotland*.—The following grants to the Board of Agriculture were recommended:—

- (i.) £2,000 for each of the financial years 1917-18 and 1918-19 to meet expenditure on the extension of State Forest Nurseries in Scotland, with a view to the provision of plants for afforestation when the War is over. About 4,500,000 seedlings had been produced by the close of the 1917 season, mainly by means of grants from the Development Fund.
- (ii.) £1,000 to meet expenditure in the year 1917-18 in connection with (a) preliminary arrangements for leasing or other proposals for the afforestation of privately-owned land in Scotland, and (b) survey work.
- (iii.) £2,000 for the year 1918-19 to meet the salaries and expenses of three forestry officers for advisory, survey, and research work—one at each of the three Scottish Agricultural Colleges. This grant includes provision for the cost of survey work and the preparation of afforestation schemes.
- (iv.) £930 to meet for the period 1st December, 1917, to 31st March, 1919, the salary and expenses of an additional Forestry Officer to the staff of the Board of Agriculture. The Commissioners were informed that the Secretary for Scotland, looking in particular to the felling of Scottish forests during the War, was satisfied that Scotland was ripe for definite afforestation schemes. The Board stated that they were anxious to prepare schemes to be in readiness for planting operations when the War is over, and that the appointment of an additional officer to the Board's staff for this purpose was essential. The Commissioners readily recommended the grant, as they consider that the preparation of afforestation schemes is of urgent national importance.

An application was received from the Board of Agriculture for a grant in aid of the capital cost and maintenance charges

of a proposed School of Forestry in Central Scotland. The Commissioners were sympathetic with the proposal, but under existing circumstances were not prepared to recommend the advance. In order that they might be in a position to consider the scheme in definite shape they asked the Board to inform them when the locality for the school had been provisionally chosen and the Board was in a position to give further particulars of the scheme.

(iv.) *Ireland*.—The following grants were recommended:—

- (i.) £1,517 for the year 1918-19 to meet the salaries and expenses of the Department of Agriculture's central forestry staff, whose appointment was made in connection with work financed from the Development Fund.
- (ii.) £1,720 for the year 1918-19 to meet the cost of forestry work in Ireland financed from the Development Fund, and concentrated at the following three areas, viz., Ballyhonra, County Cork; Slieve Bloom, Queen's County; and Aughrim-Glendalough, County Wicklow.
- (iii.) £100 to meet excess expenditure during 1915-16 on the working of the Slieve Bloom and Glendalough-Aughrim afforestation areas.
- (iv.) £100 for the expenses during 1917-18 of a Forestry Inspector from the Department whilst engaged on a joint survey with officers from the English and Scottish Boards of Agriculture. The primary object of the survey party, whose purpose was to work in selected areas in the United Kingdom, was to standardise methods of survey so far as this could be effected by associating Forestry Officers from the three Departments of Agriculture in the same survey, and at the same time to map out a considerable area of land suitable for afforestation.

Reclamation and Drainage of Land.—In the previous Report mention was made of a scheme for the improvement of the drainage of the Upper Ouse Valley, an advance not exceeding £250 being recommended for an engineer's report. This advance enabled a report to be made upon the Hundred Foot River; but, a further report upon other portions of the area being required, the Commissioners, in August 1917, recommended an advance not exceeding £500 for the purpose.

In September, 1917, the Commissioners recommended an advance, not exceeding £100, to the Land Reclamation Society, to enable a preliminary engineering report to be obtained on the possibility of reclaiming the Otmoor, a basin of some 5,000 acres in extent, lying a few miles north-east of Oxford, which is constantly in a state of flood. An advance, not exceeding £150, to the Board of Agriculture for Scotland has also been recommended for a similar report as to the proposed reclama-

tion of about 30,000 acres of low-lying land along the banks of the River Spey. These schemes promise to provide employment when needed and to make a useful addition to the area of cultivation.

AGRICULTURE AND RECONSTRUCTION :

EXTRACTS FROM PRIME MINISTER'S SPEECHES.

Speech in London on 16th November, 1918.—Agriculture was almost completely neglected by the State. During recent years very, very little was done—more, perhaps, than used to be, but very little. It was just like feeding a hungry giant with a teaspoon. In 1913 £300,000,000 worth of the products of the soil were imported from abroad which could have been produced here—and could have employed 400,000 more hands in the healthiest of occupations. That is one of the problems, and I trust that a good many of the soldiers when they come back will be settled on the soil.

Agriculture.—In England, Wales, Scotland and Ireland you have more of the land cultivated at the end of four years of war than you had in 1913, with less labour—the only country where the agricultural produce has gone up.

Speech on 23rd November, 1918.—What is the next revelation of the great War? The enormous waste of the resources of our land. What do I mean? I mean on the surface and under the surface. Britain is a rich country so far as its soil is concerned. We import hundreds of millions of our supplies from abroad. I do not mean to say that we can grow them all, but we can grow a very much larger proportion of our supplies than we have done in past years. Take food. You can grow vast quantities of food in this country for which you have been dependent on foreign imports, but you want a much more intelligent policy than that. The land must be cultivated to its full capacity. That ought to be an essential feature in the new Britain.

During the last two years we have made special efforts to increase the cultivation of the land because we were not sure what might happen as the result of the submarine campaign, and we had made up our minds that, whatever happened, the submarines were not going to starve us. So we undertook a great agricultural policy. In spite of the reduced labour we increased the area of cultivation in Great Britain and Ireland by four million acres. How was that done? By a great

combined effort. We brought the landlords in, and the farmers in, and the labourers in, and everybody who was concerned with the cultivation of the land. We got them all to work together for that purpose, and in two years, with reduced labour, we brought back the cultivation of England to where it was 40 or 50 years ago.

If you can do that with reduced labour, what can you do when the men are back on the land, and when you have more time to work out your plans. After all we had to improvise plans. We had to rush them through. They were necessarily crude. There were mistakes here and there, as always will happen when you have to do a thing in a hurry. Now you have more time to work out your plans with more men. But a systematic effort must be made to bring a population back to the land.

I am not sure we fully realise how that will react upon other problems. If you bring a population back to the land it relieves pressure on the labour market, and it sustains the labour market.

An intelligent agricultural policy is the basis of a great industrial policy, and a systematic effort must be made to bring people back to the land. That is the place to grow strong men. The touch of the soil re-invigorates and re-enforces. When there are any signs of exhaustion bring them back to the mother land, and the old life that is in the veins of Britain flows through them, and you find them re-invigorated and strong. Give back the people, as many as you can, to the cultivation of the soil. But it must be done systematically. It must be done intelligently. We must sweep aside prejudices. The difficulty, believe me, is not with interests, it is with prejudice. And that is equally true in every business. People talk about the vested interests. It is not the vested interests I am afraid of, it is vested prejudices. Sweep these away and the State can easily deal with the interests. You must not take any man's property away. You cannot build a great State on dishonesty. You are bound to come to grief if you attempt it.

You must see that the land is cultivated properly, and there is a better chance of doing it than there was 40 or 50 years ago. The principles of farming are different. Science is coming into the farming industry like any other industry. The capacity of the soil can be utilised to a much greater extent than it could

40 or 50 years ago. But you must do it on scientific principles. You must have a national supply of fertilisers that the Government ought to take care to make available.

There is another way the Government can help. You must have increased security for all capital that is spent upon the land. No man will spend his capital anywhere, whether it is industry or agriculture, unless he is quite certain he is going to get an adequate return for it and that it will not be confiscated. You must eliminate the incompetent cultivator. You must have scientific production, which involves more complete and thorough training. Training for the cultivation of the land ought to be a very special concern of the Government. You must have reclamation of waste land. That cannot be undertaken by individual landowners, for the simple reason that it may not depend entirely on them. For instance, there is the draining. It is no use your draining one part if you know that the next part is not drained.

Reclamation has got to be a connected effort directed by the State, and at the present moment there are hundreds of thousands of acres that, on investigation, have been demonstrated to be capable of being reclaimed.

There must be a scheme for settling the gallant soldiers and sailors on the land. . . . I do not say that all the soldiers will go back to the land. The vast majority will return to their old occupations. But I am told that a good many of them who have been living an open-air life do not want to return to the close atmosphere of the workshop and factory. If that is the case they ought to have the opportunity of living on the land, but they ought to be trained for the purpose. It is no use putting a man who has been used to living in a shop straight away to take charge of a small holding and run it himself. . . . It requires training, like any other industry, and you must provide that training to begin with.

There is the question of improved transportation, one of the most important questions. . . . It is not merely a question of carrying goods quickly and cheaply—the food and products of the farmer, the small holder, and the allotment holder—to the market. It is a question of carrying to the farmer, to the allotment holder, what he needs to cultivate his land, and with a cheap, quick transportation you can regenerate rural England

in such a way that you cannot do by any other means, and I consider, therefore, that to be one of the most important matters.

I should also like to develop the importance of canals.

You cannot pay the enormous debt which this War has brought upon us unless you increase production.

Speech on 7th December, 1918.—It is two years to this very day when I was summoned by the Sovereign of this country to form an Administration for the purpose of conducting the War The first thing that we concentrated upon was beating the submarine campaign The food supplies were worked up When we came in, home production was down by hundreds of thousands of acres. We had to take many men away from the fields into the battlefield. In spite of that, this year, compared with 1916, there were four million more acres under cultivation than we had in that year. That is something of which those who organised this agricultural production have a good right to feel pleased and proud.

IN view of the interest that is now taken in the general question of Agricultural Reconstruction after the War, it may be useful to draw attention to the views of the Welsh Agricultural Council on the matter as it relates to the Principality, and as expressed by the Council some time ago. Since that date the area under arable cultivation in Wales has been materially increased. The programme put forward by the Welsh Agricultural Council doubtless has an interest for many outside Wales, and for that reason it is considered desirable to publish it in this *Journal* at the present time.

I. The Council are of opinion that the land in Wales, which is mainly under grass, is not, from the point of view of the nation, producing what it should do in the way of food.

The acreages under arable land and permanent grass in Wales (including Monmouth) in 1875 were 1,112,205 and 1,815,527, respectively, while in 1915 the acreages under these heads were 725,683 and 2,251,840, respectively, showing a reduction in the area of arable land since 1875 of 386,522 acres.

II. They are also of opinion that it is possible to increase the production of wheat and other cereals in Wales without decreasing the output of live stock and live stock products.

The following extracts from tables of comparison embodied in the Parliamentary Paper (Cd. 8305), 1916, "The Recent Development of German Agriculture," by Mr. (now Sir) T. H. Middleton, C.B.,† are of interest in this connection :—

Cropping of Cultivated Land in England and Wales, and in Germany.

Crop.	England and Wales. Average of 1905-14.*		Germany. 1913.*	
	Thousand Acres.	Per cent.	Thousand Acres.	Per cent.
Permanent grass for pas- ture	11,138	40·83	2,655	3·23
Cereal crops	5,320	19·50	37,822	45·97
Potatoes	435	1·59	8,586	10·44

* The areas occupied by the various crops in England and Wales in 1913 differed but slightly from the average for the 10-year period.

Production of Meat (including Eggs) and Milk per 100 Acres Cultivated Land in Great Britain in 1908, and in Germany on the average of the Two Years 1912 and 1913.

	Great Britain. 31,900,000 Acres of Cultivated Land.		Germany. 82,274,000 Acres of Cultivated Land.	
	Home Produc- tion.	Production per 100 Acres of Cultivated Land.	Home Produc- tion.	Production per 100 Acres of Cultivated Land.
Total Meat	Tons. 1,265,150	Tons. 3·97	Tons. 3,513,260	Tons. 4·27
Milk*	5,555,000	17·4	23,160,000	28·1

* In the case of German manufactured dairy produce, the figures for butter and cheese have been converted into terms of milk.

III. The Council strongly support the reform of the land laws, so as to ensure to the tenant-farmer a fair rent, full compensation for all improvements and security of tenure, so that a tenant may not be disturbed so long as he cultivates his holding in a husband-like manner and does his duty by the State.

† See this *Journal*, August, 1916, p. 426.

- IV. In the opinion of the Council the State should guarantee a minimum price for corn in order to make it possible for the farmer to bring and maintain a larger area of land under cultivation.
- V. If a minimum price for corn is guaranteed by the State, a minimum wage fixed by Wage Boards should be secured to the farm labourer.
- VI. The Council urge that steps should be taken by the State to provide adequate and suitable housing accommodation in rural districts.

The Council consider that it would be impossible to secure adequate provision in this respect unless the Government establish a national housing scheme conceived on broad, comprehensive lines.

- VII. Action should be taken by the State with a view to
 - (a) the development of Agricultural Education, particularly in the direction of providing facilities for the training of pioneer farmers, organisers and teachers and for research ;
 - (b) the improvement of rural transport ;
 - (c) the extension of co-operation ;
 - (d) the promotion of measures of reclamation, and
 - (e) the adoption of extensive schemes of afforestation.

The Council are of opinion :—

- (1) That the ordinary curriculum of the rural Elementary Schools should be adapted to the needs of the districts and that in all such schools Elementary Science with a rural bias should be taught.

- (2) That, in view of the probability that compulsory continuation schools will be established in the near future, the curriculum of such schools that may be situated in the rural districts should be so framed as to arouse the pupils' interest in rural life.

- (3) That existing district roads should be improved and widened, and that new roads should be constructed to provide routes for road motors to convey traffic between country districts and railway centres, such works and services to be undertaken and maintained by the State.

- (4) That the Credit Scheme already established by the Board of Agriculture should be developed so that, in addition to the purchase of seeds and manures, farmers may obtain assistance to procure any other requirements necessary for cultivation purposes, and that, in order to encourage and provide security for small holders, steps

should be taken to establish schemes for insuring (i.) live stock, and (ii.) against other agricultural risks, on co-operative lines with State guarantees.

(5) That the question of drainage requires immediate attention and that the Government should, on demobilisation, undertake the draining of large tracts of land in Wales which have become useless for agricultural purposes and which, the Council consider, would, if properly drained, become highly productive.

(6) That some permanent body or bodies should be set up in order to secure the proper drainage of lands where the present drainage works have become ineffective.

VIII. The Agricultural Holdings Act, 1908, needs amendment so as (i.) to secure for the outgoing tenant more adequate compensation for unexhausted improvements, (ii.) to simplify the general procedure under the Act, and (iii.) to enable a tenant to carry out any improvement on notice being given to the landowner, and to be entitled to compensation under the Act unless the landowner proves to the satisfaction of the Board of Agriculture, as an independent authority, that the proposed improvement is unnecessary, Schedule I., Part I. of the Act being revised accordingly.

IX. In the opinion of the Council, the Live Stock Improvement Scheme should be made a permanent activity of the State and additional funds should be expended by the State in this connection.

The Council are further of opinion that increased financial provision should be made for the purpose of breeding Welsh cobs, a breed of particular importance to Wales.

X. Measures should be taken by the State for the establishment of an increased number of small holdings.

XI. More liberal provision should be made by the State to enable tenants, who so desire, to become owners of their holdings.

XII. The use of agricultural land for the rearing and preservation of game should be prohibited by law.

XIII. In the opinion of the Council, provided (a) a minimum price for his corn is secured to the farmer, (b) a minimum wage for his labour to the labourer, and (c) the relationship between landlord and tenant is placed

on a satisfactory basis, some degree of compulsion should be imposed by the State to secure production from the land.

- XIV. Should it be found impracticable to legislate on the lines of the foregoing resolutions for England as well as Wales, special legislation should, in the opinion of the Council, be enacted for Wales in this connection.

NOTE.—Several of the recommendations have since been carried into effect, while the general question of Agricultural Reconstruction in regard to England and Wales has been dealt with in detail by the Agricultural Policy Sub-Committee of the Reconstruction Committee.*

FARMYARD manure, whether it is to be used in spring or in autumn, should always be carefully kept. At present, owing to a shortage of artificials, the need for this care is all the greater.

**Dung Heaps and the
Preservation of
Farmyard Manure.†**

Spring Manuring.—In northern districts of high rainfall, spring manuring is the general practice. There, most of the dung is employed on the root shift, the greater part of one season's "make" being applied in the drills in spring. During frosty weather most of the dung is carted to the field where it will be required and heaped in "middens." Sometimes short dung is scattered on to the stubbles in autumn direct, and ploughed in; this is generally the small proportion which has been left over from the previous spring, after the root land has been manured, and, although it is recognised as being less efficient than longer dung applied in spring, its use in autumn reduces the pressure of work in the following spring and is justified on that account. This manure will either have been left in the yards or heaped in the fields somewhere handy for the stubbles.

Autumn Manuring.—In southern districts it is the custom to apply the greater part of the manure in autumn and winter, in preparation for wheat, roots or potatoes. The dung in this case consists mainly of what has been made in the yards in the previous winter; consequently the interval between the making and the application, and, therefore, the opportunities for waste, are greater than in the northern practice. The dung is, if there is room, sometimes left lying in the yards till it is

* See Final Report of this Committee (Cd. 9079, 1918). The Report was reviewed in this *Journal*, July, 1918, p. 385.

† This article is issued as Food Production Leaflet No. 60. See also Leaflet No. 93 (Farmyard Manure).

required after harvest, then carted out and spread on the land and ploughed in at once. On farms where there are covered or partly covered yards this is probably the best plan, provided the manure is prevented from becoming dry. There is no great difficulty in ploughing in such manure.

But to save time in the busy autumn months and to get the dung shorter, the yards are often emptied during frosty weather in late winter or in slack times in summer, and the manure heaped somewhere handy, either in the "seeds" field intended for wheat or potatoes or in readiness for the stubbles. In either case the manure is afterwards spread broadcast and then ploughed in.

Disadvantage of "Short" Dung.—There is no doubt that "short muck" is easier to handle, but it must be remembered that such material is the result of fermentation, and fermentation means loss of plant-food. Much of the bulky material wastes away and is lost; the residue is less able to retain the liquid, and this also tends to disappear.

Care in preventing Loss from Manure.—Whether the northern plan of applying manure in spring or the southern plan of applying it in autumn be followed it is most important that when dung-hills are made in the field or anywhere else there should be as little loss as possible. The art of making a dung-heap seems in great measure to have been lost, and the once common and efficient "cart-over" or "draw"-heap is now seldom seen.

Making a Dung Heap.—*Bottom of Heap.*—If the breadth decided upon is 15 ft., the first cartloads should be dumped in a row across the whole breadth; these loads should not be spread out thinly. The second lot of loads are laid in the next row across the breadth, and so on, the carts always passing over the loads previously laid down until the proposed length is reached. Thus the bottom is built.

Following Layers.—The next layer is formed in the same way, only each load after being dumped is well spread out, and the middle of the heap is kept slightly higher than the ends; the carts thus pass up an incline at one end and down at the other, till the whole is well trodden and compacted by the carts and horses.

Finishing off.—When the dung-hill has reached the required height the thin sloping ends and any loose dung along the sides should be thrown on top and trampled down, and the whole top then brought to a gentle ridge. It should be covered with a layer of earth, about 6 in. thick, and with straw-matched

hurdles if these are available, but it is wasteful merely to cover loose dung ; it should first be firm and solid. The object of making the heap firm is to prevent air getting in and causing fermentation. Just as, with a fire, too much air wastes coal, so, with a manure heap, too much air wastes plant-food.

Simple Rules for dealing with Manure :—

1. Until it is wanted for use, leave it where practicable under the beasts, if possible in a well-covered yard.
- 2. Never throw it out in loose heaps.
3. Move it about as little as possible. If it has to be moved store it once for all in a solid heap as near as possible to the place where it is to be used, and shelter it from rain.
4. After broaching the heap, waste no time in ploughing the dung in. Don't leave manure lying about in small heaps.
5. Try to avoid keeping manure during the summer—it is hotter then, and heat means waste.
6. Keep all the liquid in it ; don't let it drain away. If it must drain away, let it drain into a properly constructed liquid manure tank.
7. Remember that the two things that spoil manure most are air and rain, so keep it well protected from both.
8. And remember that every little bit of extra care taken means both an advance in good farming, and what is more important at present, an increase in food for man and beast.
9. Use litter as freely as supplies will allow ; it not only makes for the comfort of the animals and produces more manure, but there is evidence to show that it minimises the losses of ammonia.

It is a pleasurable duty to be able to record the general easing of the feeding-stuffs situation, and farmers generally will welcome the relief afforded them by

**Notes on Feeding
Stuffs for February :**

*From the
Animal Nutrition
Institute, Cambridge
University.*

the recent relaxations in control announced by the Ministry of Food. Before the War, the stock feeder was accustomed to the lavish use of imported cakes and meals, and a considerable proportion of home-grown barley and inferior wheat was also

devoted to stock-feeding purposes. For the first two years of the War, the stock feeder was able to carry on without much difficulty, but with the declaration of unrestricted U-boat warfare, the feeding-stuffs position became more difficult, and importation of feeding stuffs for cattle practically ceased. The position, already difficult, was accentuated by the necessity of conserving for human use all feeding stuffs capable of manufacture into human food, and towards the latter part of 1918 the outlook for the stock feeder had become very black indeed. Practically, the use of all feeding stuffs was denied to him. Barley, rye, wheat, and even tailings and screenings, were all earmarked for human food, and the only feeding stuffs, of which the grower had free use, were beans, peas, and oats.

Only national necessity justified this action on the part of the Government, and the cessation of hostilities quickly evidenced their desire to ease the situation for the stock feeders as far as emergencies allowed.

Rye has already been withdrawn from control; of *barley* farmers are allowed the use of 20 per cent. of their crop; *dredge corn* may be used for feeding stock; and licences for the use of *tailings and screenings* are more readily obtained. As a result, too, of the alteration of the milling standards, a greatly increased quantity of millers' offals is reaching the market, and the offals are of a much finer quality. It is understood also that the Ministry of Food are increasing, as far as lies within their power, the importation of oilcakes and meals.

A note of warning, however, should be added here. The feeding-stuffs market has been so exhausted during the War, stocks are at such a low ebb, and the shipping situation is still in such an unsettled state, that it will be some little time before supplies of feeding stuffs are ample enough to justify the removal of all control. Until that time arrives, the policy hitherto pursued will be continued, but the arrangements made for the distribution of feeding stuffs after 25th January (when the present buying permits expire) by the Ministry of Food will be considerably simplified. Farmers generally will have already obtained their certificates and registered them with the dealers with whom they dealt in 1917, and all those *who have not already done so* should apply immediately to their Area Live-stock Commissioner for a form of application for feeding stuffs for the stock for which supplies are desired.

It is understood that certificates will be issued by the Ministry of Food for cakes and meals for the following classes of live-

stock, and in accordance with the scale given, to cover the period 26th January, 1919, to 27th April, 1919.

<i>Class of Livestock.</i>	<i>Maximum quantity of Cake or Meal per head for which certificates may be issued for 13 weeks.</i>
I. Dairy Cattle in milk kept under rural conditions	2 cwt.
II. Dairy cattle in milk, stall-fed, and kept under town conditions. . . .	2½ cwt.
III. Calves under six months	36 lb
IV. Bulls over six months kept for breeding	2 cwt.
V. Ewes in lamb	42 lb.

Millers' offals of all kinds, screenings, grist meals, brewers' and distillers' grains and malt culms, will be free of control in distribution, but persons who are unable to obtain supplies should apply to the Livestock Commissioner for their area, who will make arrangements for the necessary supplies.

Pig owners and Pig Clubs can obtain millers' offals or grist meals without certificates. Application should be made to the Livestock Commissioner in case of difficulty in obtaining supplies. Provision is made in the general application form for pig owners requiring pig meal, and certificates will be issued against such application, but no guarantee can be given that supplies of pig meal will be available for all certificates that are issued. Applicants unable to purchase must rely on obtaining millers' offals and grist meals.

The Ministry recognise that some provision should be made for goats, in view of their value as producers of milk. Goat owners, however, should be able to obtain supplies of millers' offals or grist meals without difficulty. In case of difficulties, however, the owners should apply to the Livestock Commissioner, who will take the necessary steps to provide approximately 28 lb. per head for billy goats, and 42 lb. per head for nanny goats in milk.

The only variation in price that has occurred since the publication of the following table in this *Journal* of June last, is that of millers' offals. Owing to the change in the milling standard, offals of a much finer quality are now being produced, and, in view of this the Ministry of Food have raised the maximum price from £13 to £14 10s. a ton.

SINCE the present output of lime and lime products is far below the quantity that could be economically used for agricultural purposes, it is very desirable that full use should be made of those industrial by-products which contain lime in one form or another. Of these may be mentioned the lime waste from causticising processes in soap and bleach works, carbonate of lime from munition works, and also the waste lime from the manufacture of acetylene gas. Some idea of the production of these materials may be gathered from the fact that the pre-war consumption of calcium carbide alone equalled about 25,000 tons, which would result in the production of more than 50,000 tons of fresh lime waste per annum.

**Waste Lime from
Acetylene
Manufacture.**

The main objection to the use of such by-products is that they are generally in a moist condition and in consequence will not bear the cost of transit for long distances. On the other hand, they are largely produced in industrial districts, and it is exactly in these localities that, owing to the continued action of acid fumes from the air, the soil frequently becomes sour, and its productive power suffers in consequence.

Waste Lime from Calcium Carbide.—It is common knowledge that when water is allowed to act on calcium carbide, or carbide of lime, an energetic production of acetylene gas takes place and a residue of slaked lime is left, together with a little dissolved acetylene and any impurities which the commercial carbide may have contained. In general, the amount of the impurities is not likely to rise very high, since it is to the interest of the makers to attain as great a degree of purity of product as possible, but some amount of uncertainty has attached to the possible harmful effect of traces of sulphides and sulphocyanides which have been detected from time to time. With the object of ascertaining whether these impurities were present in sufficient quantity to exercise any deleterious effect on plant growth, experiments were carried out last season by three institutions—Oxford University, Leeds University and Rothamsted—at the request of the Food Production Department. The results of the inquiry are given below.

At Oxford and Rothamsted the experiments were made by means of pot-cultures; at Leeds, garden plots were used. In the case of the pot-culture experiments, the general scheme allowed of a comparison between carbide waste and finely-

divided calcium carbonate, (a) applied one month before sowing, and (b) applied immediately before sowing. A third portion was allowed to weather by exposure to the atmosphere for one month before application. The material for the experiments was part of a consignment of fresh carbide waste supplied to the Department by a large firm of acetylene manufacturers. It was received in a metal drum, and during transit a certain amount of free liquor had been expressed. This was drained off, and the lime was subjected to a partial drying and sieving before being dispatched to the other centres.

Oxford Experiments (Professor Somerville).—The experiments were carried out in duplicate with two different soils. Unfortunately, the crop yields of the duplicates showed very great variation, and it is doubtful whether the calculation of the mean crop weights would serve any useful purpose. It may be mentioned, however, that the heaviest crop in each of the two series was given, in one series by soil treated with carbide waste at the rate of 1.0 per cent. at the time of sowing, and in the other series by soil treated with 5.0 per cent. of carbide waste one month before sowing. With neither of the soils was there any definite evidence of injury by the applications.

Rothamsted Experiments (Dr. H. B. Hutchinson).—Three series of tests were carried out. In the first series, carbide waste was applied to an acid soil at the rate of 0.5 per cent. (3.3 tons per acre—top 6 in.). The treatments and the yields are given below:—

	Mean Dry Weight of Crop.
Control	0.65 grms.
Calcium Carbonate, applied one month before sowing	27.10 ..
Carbide waste, applied one month before sowing	27.35 ..
Calcium Carbonate, applied at time of sowing	25.05 ..
Carbide waste, applied at time of sowing	28.35 ..
Carbide waste, exposed one month,* applied at time of sowing	22.90 ..

* (Sample flooded during exposure).

The value of carbonate of lime and of the carbide waste was therefore practically identical, whether applied one month before sowing, or at the time of sowing.

Two sets of germination tests were also carried out. In these the carbide waste was applied at the rate of 1.0 and 3.0 per cent. of the soil, respectively, *i.e.*, 6.6 and 20 tons of lime

per acre (top 6 in.). Barley and mustard seeds were sown immediately after treatment, and gave the following mean germinations. In the presence of 3·0 per cent. of carbide waste germination of the seeds was slightly retarded, but after ten days the results were identical with those of the control plots—

	Control.	1·0 per cent. Carbide Lime.	3·0 per cent. Carbide Lime.
Barley (12 seeds)	.. 10·5	10·5	10·5
Mustard (20 seeds)	.. 18·5	19·5	18·0

The three series thus indicate that when carbide waste is well broken down it may be applied in fairly large quantities without giving rise to injurious effects.

Leeds Experiments (Dr. Hanley).—The work was carried out on a light coal-measures loam, with plots 1/1,200th of an acre in area. One plot served as control, a second received carbide lime at the rate of 3 tons per acre, and the third received an equivalent quantity of ground chalk.

The applications of lime and chalk were made on 30th April, and on 1st May the plots received a dressing of fertiliser at the rate of 4 cwt. of superphosphates and 1 cwt. of sulphate of ammonia per acre. Barley was sown on the latter date. Germination was normal throughout, and during the growing period there was no noticeable difference between the carbide waste and chalk plots. Both the limed plots showed a marked superiority over the unlimed plot from the start, and this was greatly accentuated by the drought. This affected all three plots, but very few plants on the control plot survived it. The crop was cut on 20th September, and gave the following results :—

	Weight of Barley in Green Condition. (Straw and Grain.)			
Control plot	100 grms.
Carbide waste plot	4,800 ..
Chalk plot	4,000 ..

The results are thus in accord with those of the experiments reviewed above.

In practice the main difficulty attending the use of such industrial residues arises from the wet condition in which they are produced, but this difficulty may be surmounted, and fairly efficient incorporation of the lime with the soil achieved, by making the application in autumn, winter or early spring, and allowing the lime to weather down and become friable. Moderate dressings would be at the rate of about $\frac{1}{2}$ cwt. per rod.

THE Third Interim Report of the Committee on the Production and Distribution of Milk is a record of the activities of the Committee since the issue of their last report. Some of the recommendations which it contains have already been adopted and are in operation, and to that extent the report may appear to have been issued rather late. It should be pointed out, however, that the Committee reported their more important decisions immediately to the Department of State concerned, in order that they might receive consideration at the earliest possible moment.

The objects aimed at by the Committee, as well as the main recommendations and conclusions arrived at, may be summarised in the following order :—

1. The Committee's policy has been, firstly, to try to maintain as far as possible the volume of milk previously produced ; secondly, to distribute it fairly in accordance with the needs of the community ; and, thirdly, to consider what steps are necessary to develop and increase the dairy industry after the War. That such development is necessary is illustrated by some interesting tables showing that the increase in cow population has not, in Great Britain, kept pace with the increase in the human population. If the cow and the human populations in the year 1871 are taken in each case as 100 it is shown that; in 1914, the human population had increased to 160, whereas the cow population has been raised only to 140. Further, the value of the dairy produce imported into the United Kingdom during the same period increased by almost 400 per cent.
2. The need for controlling, during the War period, the wholesale distribution of milk, became evident during the Committee's discussions on the desirability of rationing, when practically all the evidence showed that such shortage as existed during the winter of 1917-18 was to be attributed largely to want of organisation in distribution.
3. In the opinion of the Committee the first vital requirement for the maintenance of an adequate supply of milk is a guarantee to the producer of such a price for milk as will encourage and enable him to meet the special difficulties brought about by the War.

* Summaries of the 1st and 2nd Interim Reports of the Committee were published in this *Journal*, July, 1917, p. 450, and January, 1918, p. 1133.

4. The Committee state that, in their opinion, it would be in the interest of the consumers if, instead of having a flat rate for winter and summer milk, it became a recognised practice to charge a higher price in winter, when the cost of production is high, than is charged in summer when the cost of production is low.
5. The Committee hold the opinion, with regard to the pasteurisation of milk, that whatever the merits or otherwise of the process may be, pasteurised milk should be sold as such, and not as fresh milk, and further, that it should have been properly pasteurised, *i.e.*, in such a way as to afford the maximum of protection to the consumer as may reasonably be expected from the process when carefully applied.
6. The Committee recommend the adoption of a scheme under which a producer who keeps his herd free from tubercle and fulfils certain requirements in his methods of production, can obtain a licence authorising him to charge a price above the maximum fixed for ordinary milk. They express the opinion that cleanly production and proper cooling would effect a considerable reduction in the loss now sustained through souring.
7. The information obtained through witnesses and through the Agricultural Wages Board leads the Committee to the conclusion that unless dairy farmers are prepared to adapt themselves more nearly to modern conditions of labour as practised in other industries, they cannot hope for success in the competition of labour.
8. While approving of the general principles of the scheme adopted for the allocation of concentrated feeding-stuffs for the use of dairy cattle, they urge that considerable elasticity should be allowed in its application, in order that variations in climate and method of feeding may be taken into account.
9. In order to minimise the milk shortage and to render milk more available for the more necessitous purposes, thereby ensuring as far as possible, the effective application of the priority scheme for supply to children and invalids, the Committee recommend that there should be a reduction in the amount of milk consumed by factory workers and by the Navy and Army; and that the use of milk in the manufacture of chocolate and sweets should be prohibited.

10. The Committee recommend that in the case of necessitous children under school age the sanitary authorities should be empowered to distribute milk free or to sell at a reduced price.
11. The Committee reiterate their recommendation that with a view to the accumulation of stocks of milk products during the flush season, all surplus milk should be converted into dried and condensed milk, cheese or butter, for use during the winter. They also recommend that the Order prohibiting the use of cream for any purpose other than for the manufacture of butter should be continued.
12. The Committee recommend that every encouragement should be given in establishing co-operative milk depots near the source of milk production, by Government loans, and that assistance should be given to recognised bodies to empower them to requisition suitable buildings, if necessary, in localities where it is desirable to establish depots.
13. The Committee urge that everything possible should be done to remove any difficulties which operate against the maintenance and increase of the milk supply. In this connection they refer to the provision of more labour; assistance in obtaining machinery and dairy equipment; and the provision of advice, literature, etc., concerning the most approved methods of production.
14. Attention is drawn to the possible development of arable dairy farming, as well as to the need for further experiments and demonstrations concerning the use of milk substitutes in the rearing of calves.
15. In order that veterinary assistance to dairy farmers should not be too seriously depleted during the War, the Committee suggested that veterinary students who have completed their first professional examination and are serving in non-veterinary functions in the Army should be demobilised in order that they may continue their studies, and that a student completing his first year of study should not be called up.
16. It is advised that farmers should be encouraged to keep more accurate and detailed accounts, and that a system of account keeping should be devised for their use and every assistance provided where necessary.

17. The Committee consider that the extension and development of the practice of milk recording is a matter of great importance to the dairying industry.
18. The future work of the Committee will be to deal more fully with these matters, including the supply of farm labour, and dairy education.

THE Third Interim Report on the Production and Distribution of Milk contains in an appendix several memoranda on the use of green crops for soiling dairy cows. These memoranda are as follows:—

Green Crops for Soiling Dairy Cows. **Arable Acreage Required for Green Crops for Soiling Dairy Cows.**—Estimating that an average dairy cow would require 70 lb. of green meat daily.

Lucerne.—1 acre, 5 tons per acre (moderate crop), would yield 70 lb. of green food per square rod; therefore, 1 acre (160 square rods) produces 160 days' feed from a single cut, 320 days' feed if cut twice, and, say, 450 days' feed if cut three times.

Rye.—1 acre, $7\frac{1}{2}$ tons per acre (moderate crop), would yield 70 lb. of green food per $\frac{2}{3}$ square rod; therefore, 1 acre (160 square rods) produces $213\frac{1}{3}$ days' feed.

Tares and Oats (mixed).—1 acre, 10 tons per acre (good average crop), would yield 70 lb. of green food per $\frac{1}{2}$ square rod; therefore, 1 acre (160 square rods) produces 320 days' feed.

Maize.—1 acre, 20 tons per acre (average crop), would yield 70 lb. of green food per $\frac{1}{4}$ square rod, therefore, 1 acre (160 square rods) produces 640 days' feed.

Commence feeding rye 15th April, and continue till	
15th May	30 days.
Commence feeding tares and oats 16th May, and	
continue till 14th August	90 "
Commence feeding maize 15th August, and continue	
till 30th September	47 "
Total	167 "

Cabbages, turnips, mangolds to follow on.

Note.—There would be two sowings of rye, the first at the end of August and the second at the middle of September. Five or six sowings of tares or vetches would be needed, one of winter tares and oats in the autumn, one sowing early in February, if possible, and three or four later sowings.

Mangolds for winter food would probably follow the early rye, maize and Drumhead cabbage the later rye, and white turnips the autumn-sown tares and oats. Winter oats and wheat should be sown after the later tares and oats and also after the maize, cabbage and mangolds.

In this manner half the arable would be under corn each year and half under green crops. The Lucerne should be in addition in case of drought or crop failure. If not required for feeding it could be cut up for hay or ensilage.

R. HOBBS, Jun.

Partial Substitution of Green Crops for Pasture. — I think the following might be taken as about what might be done under favourable conditions. In many cases, however, it would not be possible owing to the land being unsuitable, such as wet and heavy land, and the impossibility of increasing the labour, in some cases intensified by lack of cottages.

For a dairy of 60 cows in milk the green crops grown might be as follows :—

Crop.	Acres.	Sown.	Cut.
Rye	2	Sept. or Oct. ..	April and May.
Winter barley	2	Sept. or Oct. ..	May.
Trifolium	3	Sept.	June.
Cabbage	3	(Planted) March ..	July and August (autumn sown plants).
Maize	2	May	Sept. (grown after winter barley).
Late cabbage or mar- row-pith kale.	5	(Planted) June ..	Oct. to March (grown after rye and tri- folium).
Mangold	15	April and May ..	Last all winter.
Lucerne	3	-	Hayed the first time, and then mown twice.

The acreage of above must necessarily vary very much indeed, according to the soil, etc. This remark applies also to the pasture required; but if the above crops are grown successfully, about three-quarters of an acre per cow might suffice up to such a time as the aftermath was ready in the meadows which had been mown.

I am of the opinion that a good deal might be done, subject, of course, to labour being available and soil and other conditions suitable, in growing food comparatively rich in albuminoids to take the place of imported foods, with a view to making a farm self-supporting as far as possible. Lucerne, tares and oats might be grown for silage and hay, clover for hay, linseed, beans—where soil is suitable, peas and possibly lupins for grinding.

Speaking generally, it will be found that the herds which run out most to pasture are healthier than those more confined in buildings and fed on a soiling system.

J. C ROBINSON.

Period of Supporting Dairy Stock on Various Crops.—There are various crops other than grass in a green or a dried state which are suitable for feeding dairy stock, but they can be most economically used as an addition to a ration of grass, hay, or straw chaff rather than as an entire substitute.

For this reason the following estimates are based on the assumption that the crops suitable for consumption during the summer months are utilised to eke out the supply of grass when this is getting short, and that, during winter and early spring, straw chaff, *ad lib.*, or hay, either long or chaffed, is available as food for the cows in addition to the crops recommended to be grown on arable land.

The weight per acre of the following crops varies very much according to the season, the nature of the soil on which they are grown, the amount and value of the manure used to stimulate their growth, and the skill employed in their cultivation.

It must, therefore, be clearly understood that the following estimate can be only a very rough guide as to the period for which a herd of 40 cows in milk can be fed on an acre of each of the following crops, and that it is understood that the cows receive in addition some grass, hay or straw chaff.

Estimated period for which a *herd of forty cows* in milk can be maintained on 1 acre of each of the following crops:—

Name of Crop.	Period when the Ration is 70 lb. per Head per Day.	Period when the Ration is 50 lb. per Head per Day.
Mangolds	12 to 24 days	15 to 30 days
Swedes or kohlrabi	9 .. 14 ..	12 .. 18 ..
Turnips, white	8 .. 11 ..	10 .. 14 ..
" Drumhead " cabbage	11 .. 16 ..	14 .. 20 ..
" Enfield " cabbage	8 .. 11 ..	10 .. 14 ..
Marrow-fat kale	8 .. 11 ..	10 .. 14 ..
Thousand head kale	8 .. 11 ..	10 .. 14 ..
Rye	3 .. 6 ..	4 .. 8 ..
Tares	2 .. 6 ..	6 .. 10 ..
Tares and oats, etc., mixture	4 .. 8 ..	6 .. 10 ..
Maize	11 .. 16 ..	14 .. 20 ..
Lucerne	5 .. 9 ..	7 .. 11 ..

F. N. WEBB.

Soiling Crops for Dairy Cows.—Soiling crops, when sown in suitable varieties and acreage, will provide green food to supplement pasture for cows from the middle of April until the beginning of October or later. In specially favourable circumstances soiling crops might even entirely replace pasture,

but under present conditions in England it is not necessary to do more than consider such crops as supplements to pasture.

The crops most suitable for soiling purposes in the south, south-west, south Midlands and east of England are rye, tares and oats mixture, and maize with additional crops, such as winter barley, trifolium and lucerne, where conditions are suitable. The approximate acreage required for a summer's supply for a herd of 40 cows, allowing 56 lb. green food daily per cow, is :—

<i>Rye</i> (2 sowings) used from mid-April to mid-May. (Part may be replaced by winter barley)	4 acres.
<i>Tare and oat mixture</i> (5-6 sowings) used from mid-May to mid-August. (In June part may be replaced by trifolium)	9-12 "
<i>Maize</i> used from mid-August to October	2-3 "

Wherever possible 4 to 8 acres of lucerne or lucerne mixture should be laid down to act as a reserve in case of a drought or crop failure ; when not required for cows it can be cut for other stock or made into hay. At least two, and usually three, cuttings of lucerne can be obtained annually.

The growing of soiling crops and the cutting and carting daily to stock requires much more labour than the mere grazing of cows on pasture throughout the summer ; hence, farmers who are asked to plough up grass land and to maintain their dairy herds partly on the soiling system should be enabled to obtain labour over and above that required for the extra acreage of grain and potatoes grown. Also, the growing and feeding of soiling crops adds materially to the cost of production of milk during summer as compared with production of milk on pasture only.

In the past, the use of soiling crops during summer has not been a universal or even a common practice in the dairying districts of England ; hence, many farmers, who now have to plough up some of their pasture and are advised to grow soiling crops, have had little or no experience of such crops ; the methods of sowing, cultivation, and general management are imperfectly understood. Farmers in this position should be provided with detailed and reliable information as to how the various crops can be grown and utilised with the greatest success, and the County Agricultural Organisers and other advisory officers should be asked to give special attention to this aspect of their work.

Where County War Agricultural Committees have taken over the management of a dairy farm or farms, demonstra-

tions in the growing and utilisation of soiling crops should be given. It is most important, in view of the official advice given, that the dairy herds be maintained on such farms.

As the breaking up of pasture is almost certain to be continued during the autumn, winter and spring of 1918-19, the need for accurate and additional information on the soiling system is self-evident, and agricultural colleges and farm institutes maintaining herds of cows on their own farms should be asked to undertake the demonstration on as large a scale as practicable of the maintenance of dairy herds during the summer on the minimum acreage of pasture, and during the winter on rations sufficient for normal milk production, but without, or with the minimum of, concentrated foods.

In so far as practicable under present conditions, experiments should be carried out on the suitability for different conditions of soil and climate of different varieties and different mixtures of soiling crops, and on the possibility of reducing the labour in cutting and carting.

Owing to the value of lucerne—

- (a) as a green food or as hay rich in proteins, thus reducing the need for concentrates ;
- (b) as a soiling crop giving two or three cuts annually for four to six years, thus saving labour in cultivation ;
- (c) as a nitrogen-collecting crop, thus enriching the soil for succeeding crops ;

it is desirable that all the experimental work of recent years on this crop should be examined and such results as are valuable to the farmer published and distributed, and that steps should be taken to demonstrate more fully the value of lucerne in districts where it has been successfully grown, to carry out trials in districts where it would supply a felt want, and to carry out experiments on such points as a survey of present information may show to require further investigation.

J. MACKINTOSH.

THE Sub-Committee of the Committee on the Production and Distribution of Milk appointed to inquire into and report whether it was desirable and, if so, what

Milk from Goats. steps should be taken, to encourage the keeping of goats for milk production, have arrived at the following conclusions :—

1. That it is advisable to take immediate steps to encourage the increased production of goats' milk, particularly in rural districts where there is any shortage—or threatened shortage—of cows' milk.

2. That the Committee should formulate a definite scheme for that purpose.

With a view to assisting in the increased production of goats' milk the Sub-Committee suggest the following scheme for the consideration of the Committee :—

1. The formation of a Central Committee to undertake all the necessary work for the improvement in type and the increase in numbers of goats in this country. This Committee should include members selected for their special knowledge of, and interest in, goats, together with representatives of the Boards of Agriculture, the Local Government Boards and the Ministry of Food.
2. The establishment of central stud farms for goats in England and in Scotland.
3. The obtaining of a Government grant for :—
 - (a) Purchasing or renting the necessary land and premises for the stud farms.
 - (b) Management of the stud farms.
 - (c) Stocking of the stud farms.
4. The formation of local clubs throughout the country for :—
 - (a) Improvement in feeding and management of goats.
 - (b) The placing of stud goats in suitable centres.
5. The provision of expert advisory services in goat management and for the inspection of the working of the local clubs.

The duties of the Central Committee would include the following :—

- (a) The general management of the scheme outlined above.
- (b) The issue of educational literature amongst goat-keepers and the encouragement of interest in the scheme.
- (c) The arrangements for importation of male blood stock.
- (d) The establishment of local clubs.
- (e) The arrangements for exhibits of and classes for goats at live-stock and other shows.
- (f) The encouragement of the study of goat diseases by veterinary surgeons.
- (g) The keeping of all desirable records in respect of milk yield and quality, pedigrees, registers of non-pedigree stock, etc.

The Committee attach great importance to the establishment of central stud farms and have been given to understand that, so far as England is concerned, suitable premises are available.

THE following Note is abstracted from the Report on the Working of Small Holdings acquired under the Small Holdings and Allotments Act, 1908, recently presented to Parliament* :—

Working of Small Holdings Acquired under the Small Holdings and Allotments Act, 1908.

The Board recently circularised County Councils in order to obtain information with regard to the measure of success which had attended the small holders placed on the land under the provisions of the Small Holdings and Allotments Act, 1908. The Board realised that the majority of the County Councils were working with depleted staffs, but, in view of the problems which are under consideration with regard to land settlement, it was felt that the present was a suitable time to obtain information as to the result of the working of the Act.

The subjoined table has been prepared showing, as far as practicable, the result of the Board's inquiry. Particulars are not available as regards certain counties, owing to the fact that some of the Councils' Small Holdings staffs have been so depleted either by the calls of military service or the demands made on the time of officials who are working for the Agricultural Executive Committees which have been appointed to deal with questions of ploughing up grass land, cultivations, etc., etc., and, as an instance of the difficulties under which County Councils are labouring, the case of the County of Hampshire may be quoted. The gentleman who was appointed Small Holdings Officer in this county in 1909 left in May, 1914, to take up another appointment, and is now serving in the Army ; his assistant during the greater part of his period of service has been killed in the War. The successor to the Small Holdings Officer, who continued to hold the office until he joined the Army, is now wounded and missing ; his assistant has been killed in the War, and the gentleman who acted as temporary officer has also been taken into the Army and is serving abroad. The County Council are making the best arrangements they can for carrying on the existing holdings, and the members of the County Council have themselves been good enough to view the small holdings from time to time with a view to seeing whether their cultivation is properly maintained.

* Cd. 9203, 1918, price 1d. To be obtained from H.M. Stationery Office, at the following addresses : Imperial House, Kingsway, London, W.C. 2, and 28, Abingdon Street, London, S.W. 1 ; 37, Peter Street, Manchester ; 1, St. Andrew's Crescent, Cardiff ; 23, Forth Street, Edinburgh ; or from E. Ponsonby, Ltd., 116, Grafton Street, Dublin.

Table shewing Numbers of Councils' Tenants and Failures, together with Particulars of Rents Collected, Outstanding and Irrecoverable.

COUNTIES.	Total number of Council's tenants.	No. of tenants who have quitted (excluding those who have died, joined the Army, or taken holdings elsewhere).	Number of tenants who must be regarded as failures.	Total acreage occupied by such tenants.	Percentage of failures to total number of tenants.	Percentage of acreage occupied by such tenants to total acreage or agreed to be acquired up to 31st Dec., 1914.	Total rents collected since 1st Jan., 1908.	Arrears of rent.		Percentage of irrecoverable arrears to total rents collected.

* Including deaths.

* Notices given by Council.

Where particulars are not inserted in the table as regards any county no meaning can be attached to the absence of information, other than the fact that the Council's staff were unable, in addition to their current work, to furnish the return asked for by the Board.

An examination of the figures showing the relatively small numbers of failures amongst small holders settled on the land under the Act, and the almost negligible amount of arrears of rent written off by Councils as irrecoverable, indicates clearly that the results obtained under the Act may be regarded as successful, such as would compare favourably with those obtained on private estates. The personal equation will, of course, always enter largely into the question of the success or failure of a small holder. It may be noted that in many cases where small holders have failed, other tenants have been obtained by the Council, who, in contrast to their predecessors, have made the holdings profitable, thus indicating that neither the land nor equipment caused the failure, but some lack of energy, experience or capital on the part of the original small holder.

CONSIDERABLE interest has been aroused in various counties in the question of improving the main drainage of land for agricultural purposes. The Board of Agriculture have received requests to initiate drainage authorities upon rivers so wide apart as the Yorkshire Ouse and its tributaries, the Welland, the Great Ouse, the Wey and the Mole, the Upper Severn, the Clwyd, and the Dee. The necessary inquiries in these and other areas are being instituted by the Land Drainage Section of the Board's staff, with the co-operation of the Ordnance Survey, and it is hoped that it will not be very long before the necessary Orders can be drafted.

The Land Drainage Acts and Regulations provide ample opportunities for objections on the part of those concerned as well as for consultation with the County Councils affected; and the drafting of an Order for the proposed area must be regarded as only the first step in the establishment of a drainage authority. The proceedings will, however, be carried out as promptly as is compatible with the interests involved; and now that the necessity and usefulness of the main drainage

channels have been conclusively demonstrated it may be hoped that there will be little opposition in principle to the proposals made. When the drainage authorities have been set up, it will be for each of them to consider what are the best measures to be carried out for improving the area under their jurisdiction. They will possess both rating and borrowing powers, but no one is liable to pay rates to a drainage authority except in respect of land which is benefited by the work.

The Board of Agriculture are inviting County Councils to form standing committees for consultation with the Board upon any proposed Orders establishing drainage authorities or altering the boundaries of existing drainage areas. It is highly important that these matters should be freely and constantly discussed between the Board and the County Councils without the delay which would be entailed by a separate reference in each case. The Board are also prepared to delegate to a committee for each county their powers under Part II. of the Act of 1918 for securing that the powers of existing drainage authorities are efficiently exercised, and for carrying out the schemes authorised by the Act in small areas, in which the establishment of a separate authority would not be appropriate. Such a "drainage committee" will comprise a majority of county or county borough councillors and will consist, as a rule, of eight members appointed by the Councils and four by the Board. Where the committee propose to exercise the powers of an existing drainage authority the authority will have a right of appeal to the Board. These provisions will be found in the Land Drainage (Constitution of Authority) Regulations, 1919*, which have been made by the Board under the Act of 1918.

A considerable amount of clearance has been done and is still being done by means of prisoners of war on many rivers and drainage areas in England and Wales; for instance, on the Waveney, Yare, and other Norfolk rivers, on the Mardyke in Essex, and on the River Birkett, and the Frodsham Marshes in Cheshire. A marked improvement has been effected by this means in the valley of the Ivel, where a considerable area of valuable market garden land near Biggleswade has been saved from floods this autumn and winter. So successful have these operations been that the Executive Committees of Bedfordshire, Huntingdonshire, and Cambridgeshire have applied for the services of several hundred prisoners to clear out the upper

* See p 1226.

reaches of the Ouse, into which the Ivel flows; and the prisoners are being sent as accommodation is got ready. The work is being commenced on the by-channels with which the Ouse here is provided, and which are not too deep or full to be capable of being dealt with in the winter. On 20th December, after all the heavy rain that had fallen, the water in the cleansed portion of the Ivel was not more than half way up the banks.

DURING 1918 and 1917 the subject of improving the main-drainage channels has been taken up with great enthusiasm in Yorkshire among other counties; and remarkable results have been achieved at a comparatively small cost. The low-lying lands around Doncaster and on the north bank of the Humber are provided with drainage systems which have long existed; but many of these were in a state of great neglect when the Agricultural Executives of the East and West Ridings turned their attention to this matter in the spring of 1917.

In the East Riding the cleansing of the Greenoak Goit was completed in 1917, and about 2,000 acres were greatly improved, thereby at a cost of £600. Work on the Bellasize Drain was completed in October, 1918, in spite of difficulties caused by the shifting nature of the sandy clay soil. The drain is now said to be working more efficiently than it has done for 70 years past; and an area of approximately 4,000 acres has been greatly benefited at an expense of about £1,200. The water in the Market Weighton Canal (which forms the outlet of the River Foulness) has been substantially lowered by the regulation of the lock gates giving on to the Humber, and the cleansing of the canal is being carried out; the area which will ultimately be benefited by this work extends to about 20,000 acres. The Committee have commenced work upon the clearance of the Howden drainage system.

The following is a brief summary of the principal work carried out by the West Riding Agricultural Executive Committee:—

West Moor and Parks Drains.—Area improved, 3,327 acres; area reclaimed, 700 acres; estimated cost, £1,365.

Tickhill.—Area improved, 2,750 acres; area reclaimed, 200 acres; actual cost, £364 18s. 4d.

Thorne.—Area improved, 13,000 acres; area reclaimed, 200 acres; estimated cost, £2,700.

Gowdall.—Area improved, 700 acres ; estimated cost, £250.

River Don.—Area improved, by clearing a short and much congested reach, 40,000 acres ; estimated cost, £500.

Awkley Bridge (River Torne).—Area improved, 2,000 acres ; actual cost, £17 ; arches altered by County Council and other work undertaken by private owners.

Awkley and Blaxton.—Area affected, 2,500 acres ; estimated cost, £50.

Doncaster and Balby Car.—Area improved, 300 acres.

Lower Anker Drain.—Area improved, 250 acres ; estimated cost, £140.

Tranmoor Drain.—Area improved, 150 acres ; estimated cost, £50.

Little Went Drainage.—On representation by the Committee the Little Went has been cleaned out by co-operation of adjoining owners ; this is not known to have been done before at any time, and the improvement is considerable.

The Committee and their Chief Executive Officer also undertook with great promptitude the repair of the disastrous breaches in the banks of the Ouse and the Aire which occurred in September, 1918.

The above are given only as examples of the results that can be achieved by manual labour alone without mechanical appliances, such as steam dredgers or pumping engines.

Other counties have not lagged behind ; and similar work has been done (to give only a few instances) in counties so far apart as the North Riding of Yorkshire, Norfolk, Berkshire, Cheshire, Lancashire and Flintshire.

THE attention of the Board has been directed to the possible use of duckweed (*Lemna*) for feeding ducks and pigs. Ac-

A Use for
Duckweed.

cording to Mayer,* the plant contains 1·8 per cent. of albuminoids in the wet state, and in the dried condition, 23·8 per cent. of albuminoids, 3·9 per cent. of oil, 36·7 per cent. of carbohydrates, 9 per cent. of fibre, and 18·1 per cent. of ash. When cooked, the weed is stated to be a good food for pigs and poultry.† Owing to the difficulty of collecting the weed, and the comparatively small quantity obtainable from a fairly large area, it is scarcely practicable to collect it for pigs.

* A. Mayer, *Tijdschrift voor Landbouwkunde*, 2, 51.

† Emil Pott, *Handbuch der tierischen Ernährung und der landwirtschaftlichen Füttermittel*, 1907.

The numerous polypera, mollusks, insects and their larvæ which are to be found underneath the leaves, however, are eagerly sought after by ducks, which devour considerable quantities of the weed. There are numerous large ponds and swampy areas in this country which abound in duckweed and other water weeds, and it is suggested that ducks might profitably be more extensively reared in such areas, so utilising to the full the natural food supplied by such weeds, and the animal life with which they are associated. So reared, ducks require little concentrated food after they are a month old.

THE Board have received some interesting particulars of a remarkable crop of onions grown on an area of 46 rods by Mr. A. J. S. Cousins, of Eastville, Bristol.

A Heavy Crop of Onions.

The onions were pulled in a partially green state and gathered in baskets, each basket holding about 1 cwt. Altogether 172 basketfuls were collected, Mr. Cousins estimates that every 5 basketfuls will give 3 cwt. of dry or marketable onions, and on this estimate the crop works out at approximately 18 tons per acre.

Mr. Cousins states that part of the land was planted with cabbages in October, 1916, and manured with stable manure at the rate of 100 loads per acre. Celery was planted in July, 1917, and the onions (Bunting's "Up-to-Date") were sown in 1918, each time without the application of manure.

THE Food Production Department has for more than twelve months been advising villagers to keep more bees, and its advice has been extensively followed by rural residents. The

Bee-keeping : Food Production Department's Schemes.

Department has also by means of lectures and demonstrations, the supply of simple, practical leaflets and other measures, been showing villagers how bees may be kept profitably. Bee-keepers generally throughout the country were greatly discouraged and suffered serious loss by reason of the epidemic of Isle of Wight disease, which wiped out the large majority of the stocks of English bees and has only this year shown signs of abatement. For several years past a Government scheme for providing bees with medicated candy for winter feeding has been in operation; and it is probable that the consequent strengthening and stimulation of the remaining stocks in the country has had a bearing on the decreasing virulence of the bee plague.

Bee-keepers requiring bee food for spring feeding must register with the Secretary of the Horticultural Sub-Committee of the Agricultural Executive Committee for the county, from whom special forms can be obtained

Early in the past year the Food Production Department set up a Bee Section, to which the Secretary of the National Bee-keepers' Association is attached; and this section, by means of the systematic inspection of apiaries and advice to bee-keepers, has done much to restore confidence and to place the future of the industry of bee-keeping on a more satisfactory basis. With a view to the prompt and successful revival of the industry, the Department has lately urged the Horticultural Sub-Committees of the counties to organise local bee registration and re-stocking schemes through Bee Committees in co-operation with the local Bee-keepers' Association. It is hoped that growers of fruit in particular will assist, enthusiastically, the development of these schemes. The importance of bee-keeping to the fruit grower can hardly be overstated. Experiments made have proved that if a hive or two of bees is kept within a furlong (220 yards) of a fruit plantation 80 per cent. of the fertilisation is done by hive bees.

Up to 3rd January 23 counties had agreed to form Bee Committees on the lines suggested by the Food Production Department for the purpose of carrying out the scheme of registration and re-stocking.

THE first Allotment Inspector was appointed by the Food Production Department on 3rd December, 1917; and the Department has just issued a statement dealing with the work of

Allotment Progress. its allotment inspectors for the twelve months ending 3rd December, 1918. From this statement it appears that with the assistance of the inspectors local authorities have laid out new allotments during the past year at the rate of over 1,000 acres per month. Upwards of 20,000 acres of land were inspected with a view to their possible use as allotments; 12,610 acres were actually acquired for the purpose, representing approximately 180,000 new allotment plots arranged for in the twelve months. The greater number of these plots, it may be added, are in urban areas, and form parts of comparatively small pieces of ground.

The past year's figures show that there is little, if any, abatement in the demand for allotments, and that the domestic food production movement is likely to remain a permanent feature of the national economy. They compare, not at all unfavourably, in the circumstances, with the figures for the previous year. In the twelve months ending 31st December, 1917, about 17,000 acres, or 204,000 allotments, were laid out by local authorities. In comparing the figures of 1917 and 1918, it should be remembered that the former include a considerable area of unoccupied land which was immediately available when powers under D.O.R.A. were first given to the allotment authorities in December, 1916. Obviously, after this land had been apportioned the difficulty of finding further suitable ground for allotments was increased.

Negotiations with local authorities and landowners with a view to the development of the allotment area represent only a part of the work done by the Allotment Section of the Department. In a considerable number of cases, for one reason or another, notice was given to allotment holders to vacate their plots. When appeal has been made in these circumstances to the Department inspectors have taken up the matter for the purpose of securing a cancellation of the notice, or obtaining other land and fair compensation for the tenants. Many claims for compensation by owners have also received the attention of the inspectors, who, moreover, during a campaign amongst farmers

in the spring, succeeded in obtaining promises for the planting this year of an additional area of about 20,000 acres of potatoes on the farms.

A surprisingly large amount of food has been produced during the past year on some of the allotments of Outer London. As an instance the Food Production Department gives figures referring to the Beckenham area. In this district 500 allotment holders produced 800 tons of potatoes, 51 tons of onions, and 250,000 cabbages, as well as a considerable quantity of other vegetables, their allotments averaging 10 poles each.

FOR the guidance of persons who desire to start factories for the manufacture of potato flour, the Director of Vegetable Preservation (100, Cromwell Road, S.W. 7) has issued a prospectus. In any potato-growing district where a factory can command supplies without recourse to the railways it is assumed that a maximum of eight flaking machines may be installed in one factory, and estimates are given for such a factory.

Manufacture of Potato Flour.

The floor area required, including boiler and engine rooms, office accommodation and all else, is about 10,000 sq. ft., of which 4,500 sq. ft. will be needed for storage and 1,500 for buildings to accommodate the flaking machines. These buildings should not be less than 20 ft. high; in other parts of the area lower buildings may serve. An 8-unit factory will be capable of handling about 300 tons of potatoes weekly, and will consume about 10 cwt. of coal per working hour. The machinery peculiar to the process will be supplied at cost price by the Ministry. Some of it is available for immediate delivery, together with a limited number of boilers and engines in certain sizes. Piping, shafting, and accessories must be provided by the contractor, who, however, will be helped with priorities and other facilities.

The capital expenditure incurred in establishing a factory will, of course, depend upon its position and the extent and nature of buildings and plant in being. Assuming, however, that buildings, boilers, and power for driving are already rented, the net capital cost of an 8-unit factory would be about £11,000, allowing for full equipment with labour-saving devices. This sum does not include the working capital required; but the Department will give terms of credit for the purchasing of the potatoes. Payment by the Ministry of Food for the flake will be based on an estimate of cost of production prepared by the contractor and approved by the Director of Vegetable Preservation. This estimate will assume that the factory works at full output for 40 weeks of 120 hours each, and that it requires $5\frac{1}{2}$ tons of potatoes to produce 1 ton of flake. Thus arrived at, the cost price per ton of potato-flake (which for this purpose includes also the skin) will be paid for all flake and skin delivered and accepted, together with an additional sum representing the firm's profit.

This allowance for profit will be sufficient to enable the contractor, when giving full output, to obtain on the capital invested the maximum return allowed by the Inland Revenue Authorities before Excess Profits Duty is chargeable. On the determination of this contract, the contractor will be entitled to write off 75 per cent. of the original capital cost of plant and 50 per cent. of the original capital cost of buildings specially erected for the work, and of structural alterations to existing buildings.

The Ministry will supply potatoes (at a fixed price per ton) sufficient to keep the factory producing at full output for the full working season. In the event of their failure to do so, fixed standing charges will be paid *pro rata* on the deficiency, with interest on capital at 5 per cent. per working year of 40 weeks. (*National Food Journal*, 13th November, 1918.)

An article in the *Agricultural Gazette of Canada* for September, 1918, gives an account of the Grants allotted by the Government of the Dominion to the various Provinces in respect of agricultural instruction for the year 1918-19, under the Agricultural Instruction Act. The following is a list of the Grants:—

**Grants in Aid of
Agricultural
Instruction in
Canada.**

		\$	£
Ontario	336,303	26	(70,063)
Quebec	271,113	76	(56,482)
Nova Scotia	81,716	69	(17,025)
New Brunswick	64,110	80	(13,356)
Prince Edward Island	31,749	22	(6,614)
British Columbia	69,199	06	(14,417)
Manitoba	77,113	11	(16,065)
Saskatchewan	81,728	48	(17,027)
Alberta	66,965	62	(13,951)
Veterinary Colleges	20,000	00	(4,167)
Total	1,100,000	00	(£229,167)

Agreements have been entered into with all the Provinces as to the purposes to which the money is to be devoted. The work to be carried on is to be similar to that of previous years, and may be considered under two heads.

The Grant under the first head is to be directed to assistance in elementary agricultural education, including school agriculture, boys' and girls' clubs and competitions and school fairs, short courses of instruction, and aid to agricultural schools. The curriculum of the public schools, particularly of the rural schools, is gradually changing, and considerable attention is being paid to nature study and elementary agriculture, including school and home gardening.

The second main division of work is that of instruction and demonstration. The primary end in view is to bring home to those engaged in farming, by various methods, a knowledge of up-to-date agriculture, and much is being accomplished in this way. The Grant gives assistance in agricultural representatives' work, live stock, dairying, field husbandry, seed production, poultry, horticulture, insect and plant disease control, bee-keeping, drainage, demonstration farms, co-operation and marketing, demonstration trains, and to the instructional work carried on by the extension services of the respective agricultural departments.

The amount allotted to women's work is given in acknowledgment of the difficulties and disadvantages associated with domestic life on the farm and in response to the needs of farm women. In many of the Provinces the Grant supplies all the funds employed in the conduct of women's institutes, home-makers' clubs, and home economic societies. In other Provinces, such as Ontario, it provides for the holding of special classes of instruction in domestic science and the household arts.

OFFICIAL NOTICES AND CIRCULARS.

N.B.—The Orders which may be mentioned in this section of the JOURNAL may usually be obtained at the price of 1d. each from H.M. Stationery Office, Imperial House, Kingsway, London, W.C. 2, and 28, Abingdon Street, London, S.W. 1; 37, Peter Street, Manchester, and 1, St. Andrew's Crescent, Cardiff.

THE Board of Agriculture and Fisheries, in exercise of the power conferred by Section 17 of the Land Drainage Act, 1918, have made the following Regulations. They are dated

**Land Drainage
(Constitution of
Authority)
Regulations, 1919.**

1st January, 1919 :—

1. A drainage committee may for the purposes of the said section be constituted in accordance with these Regulations for an area consisting of such one or more administrative counties as may in each case be sanctioned by Order of the Board, and if the Order so provides the area may include one or more county boroughs.

2. A drainage committee shall consist, unless the Board by Order otherwise direct, of twelve members, of whom eight shall be appointed by the council or councils of the county or counties or county boroughs or boroughs comprised in the area, and where there is more than one appointing council the members shall be appointed by the councils acting severally or jointly and in such proportions as the Board may by Order direct. The remaining four members shall be appointed by the Board.

3. A member of a committee appointed by a council who is a member of the council at the date of his appointment shall cease to be a member of the committee on ceasing to be a member of the council. Subject as aforesaid, the term of office of a member shall be three years, unless by notice in writing to the committee he resigns his appointment or his appointment is terminated by the body which appointed him.

4. Unless an Order of the Board otherwise directs a council may appoint as a member of the committee a person who is not a member of the council, but a majority of the members of the committee shall consist of members of the appointing council or councils.

5. A member of a committee shall not take part in any decision of a committee which relates to any drainage authority of which he is a member, or relates to any land of which he is the owner or occupier or the agent of the owner or occupier, and a member shall not enter into any contract with the committee unless such contract has been approved by the Board.

6. A committee constituted in the manner prescribed by these Regulations may, with respect to the area for which it is constituted, exercise on behalf of the Board any of the powers of the Board under Part II. of the Land Drainage Act, 1918, except the power of the Board of considering and determining objections made to a draft scheme under Section 16 of the said Act and of settling any such scheme to which objection has been duly made.

7. (1) Where a committee intend under the provisions of Section 15 of the said Act—

(a) to enforce by means of an officer appointed by them any liability to repair which is enforceable under Section 15 of the Sewers Act, 1833 ; or

(b) to exercise any drainage powers which are conferred by any general or local Act, or an Order having the force of an Act of Parliament, or by an award made under any Act or by any Commission of Sewers and any power conferred by any such Act, Order, Award or Commission for defraying the expenses so incurred or for any purpose incidental to the exercise of such power.

(2) The Committee shall give or cause to be given previous notice in writing of their intention to enforce the liability, or exercise the powers, to the body or person whose liability to repair is intended to be enforced, or to any body or person empowered to exercise the drainage powers which are intended to be exercised, as the case may be.

(a) The notice prescribed by this Regulation shall—

(i.) in any case to which paragraph (a) relates, be a seven-days' notice ; and

(ii.) in any case to which paragraph (b) relates, be a thirty-days' notice.

(3) A notice under this Regulation may be given to any person by leaving it for him at his last-known place of abode or by sending it through the post by a registered letter addressed to him there ; or, where his name and place of abode cannot reasonably be ascertained by the committee, a notice to such person may be given by fixing a copy of the notice to any land to which the liability to be enforced attaches.

8. Any body or person to whom a notice is given under the preceding Regulation, may before the expiration of the seven or thirty days, as the case may be, appeal to the Board against the intended action by the committee and where any such appeal is made no action shall be taken by the committee for giving effect to their intention until the determination of the appeal by the Board or except in accordance with such determination.

9. The preceding Regulations relating to notice and appeal shall not apply in any case where the Board are satisfied that on account of urgency it is desirable that the committee should act without complying with such Regulations and authorise the committee to act accordingly.

10. Accounts shall be kept by a committee of their receipts and expenditure and be open to inspection by any officer of the Board, and those accounts shall be made up and audited in such manner as the Board shall direct.

11. A committee shall appoint a chairman of the committee. At any meeting at which the chairman is not present a person appointed by the meeting shall be entitled to act as chairman of the Committee. At any meeting of a committee the chairman shall, in case of an equal division of votes, have a second or casting vote.

12. The quorum proceedings and place of meeting of a committee shall be such as the committee determine.

13. The proceedings of a committee shall not be invalidated by any vacancy among its members, or by any defect in the appointment or qualification of any of its members.

14. Minutes of the proceedings of a committee shall be kept, and a minute of those proceedings signed at the same or the next ensuing meeting by a person describing himself as, or appearing to be, chairman of the meeting at which the minute is signed shall be received in evidence without further proof.

15. Any notice, direction or other instrument signed by a person describing himself as, or appearing to be, chairman of a committee, shall be received in evidence without further proof as a notice, direction or instrument issued by the committee.

16. Until the contrary is proved a committee shall be deemed to have been duly constituted.

17. A committee may, subject to any directions given by the Board, appoint such sub-committee as the committee thinks fit. A sub-committee may consist either wholly or partly of persons not being members of the committee. The acts of a sub-committee shall be subject to confirmation by the committee.

18. These Regulations apply only to administrative counties and county boroughs in England and Wales.

THE following Notice was issued by the Food Production Department of the Board on 13th December :—

**Land Drainage:
The Need for a Clear
Outlet.**

It is sometimes thought that the necessity of keeping main-drainage channels clear is confined to the Fenlands or other low-lying areas, which are liable to inundation. In many places winter flooding is regarded as a normal and inevitable condition of these lands—and, indeed, it is true that certain classes of grass land derive benefit from an occasional brief flooding, if it occurs at the proper season, to provide a top dressing of river silt. But a sudden summer flood may carry away the hay or destroy valuable crops of potatoes or corn, causing heavy loss to the farmers who are affected by the catastrophe.

However, it is not only to prevent the disastrous effects of summer floods that main-drainage is needed. Every agriculturist knows the benefits derived from field drainage in its various forms. To quote an early writer : “ While land remains in a wet state the manure laid upon it is, comparatively speaking, of little use ; the seed sown often perishes : the crops are sickly, and later of ripening ; and the operations of harvest are attended with, perhaps, injury to the soil, uncertainty, and danger. The beneficial effects of draining on grass land are also very great. It is less liable to be poached ; rushes and other aquatic plants soon disappear ; the finer grasses rise in abundance ; the pastures maintain a greater number of cattle and sheep ; the stock becomes superior in quality and less subject to disease, and if the land be mown, the hay produced is much improved in quality.”

The defects that Sinclair enumerates can be cured and the advantages attained by field drains that carry the subsoil water to the stream or main dyke, provided that these in their turn—and the rivers that they feed—are capable of carrying off the water. But if they are not, what is the use of the field drains ? Who will spend money on a drain that has no outlet ?

In many parts of England there are fine systems of arterial drainage, formed by the practical sense of our forefathers, which have been neglected of late years till they are almost derelict. In other parts

there are natural rivers; and it is no exaggeration to say that the majority of the English rivers are so clogged up by shoals, mudbanks, ingrowing trees and similar obstructions that they cannot discharge one of their main functions, that of carrying off the surplus water from agricultural land. The cleansing and thorough restoration of these main-drainage channels, natural as well as artificial, is one of the first necessities for increased production in this country.

THE following Memorandum (No. C. L. 154/L. 4), was addressed to Agricultural Executive Committees by the Food Production Department of the Board on 6th December :—

Prisoner Labour :

Migratory Gangs.

The War Office have now approved the employment of migratory gangs of Prisoners of War on threshing and other agricultural work, in accordance with the attached scheme* which takes the place of the Department's Circular (F. P. 295/L. 2†) of the 19th June last, which is cancelled. It will be observed that the financial arrangements have been slightly amended.

Committees should, therefore, make application for any additional migratory gangs they may require to the Area Commandant.

Committees will appreciate that now that British civilian labour is becoming available by reason of the closing of munition factories, aerodromes, etc., it is necessary to exercise particular care in connection with prisoner labour. Such labour must not be allowed to interfere in any way with the employment of British civilians who desire to take up or return to farm work, and Committees should dispense with prisoners in any district where available civilian labour can be placed. Every effort should be made to secure for agriculture civilians now leaving their war jobs. Committees can assist by inducing farmers to advertise their requirements in the Press and also to register them at the nearest Employment Exchange.

ENCLOSURE (F. P. 435/L. 4).

Scheme for the Employment of Prisoners of War in Migratory Gangs for Threshing and other Agricultural Work.

1. Each gang will consist of ten prisoners and two guards and will be available to meet the requirements of those districts which are not served by any existing prisoner-of-war camp.

2. The County Agricultural Executive Committee must decide whether demands for a migratory gang should be met. In this connection it should be noted that :—

(a) Migratory gangs must not be worked within 5 miles of the coast without the express sanction of the Area Commandant, or in the vicinity of an aerodrome, munition works, or any other important military or naval station.

(b) Prisoners must not be worked in a neighbourhood served by a women's agricultural camp.

3. The Committee will be responsible for selecting and securing accommodation (including a sufficient supply of good water), for each gang in a lock-up building, centrally situated and suitable for accommodating the whole of the gang. Provision must be made for heating and lighting in consultation with the Commandant of Prisoners of War

* See below.

† Printed in this *Journal*, July, 1918, p. 469.

for the area. Alternatively the prisoners might be accommodated in a travelling van.

4. The Commandant of Prisoners of War for the area must be notified by the Agricultural Executive Committee of the approved applications for migratory gangs and of the arrangements made for their accommodation at least 14 days before the date on which it is desired that the men should be sent out. The Commandant must be kept informed of the location of each gang.

5. The military authorities will supply stoves, palliasses, blankets, mess-tins and cooking utensils for the gangs, the Agricultural Executive Committee arranging for the supply of straw locally.

6. No farmer or other person may give money to a prisoner of war, otherwise he will be guilty of a breach of the Defence of the Realm Regulations.

7. Rations for the prisoners and guard will be supplied by the military authorities. Rations will be delivered by the military authorities at the nearest railway station, the Committee being responsible for transport between such station and the gang. No expenses will be incurred in the conveyance of the prisoners, as they will be sent by the military authorities to the nearest railway station and must walk from the station to the accommodation arranged.

8. Each gang will be attached to a Prisoners of War Camp in the county, and the officer in charge will pay periodical visits to ensure that the work and discipline and the arrangements for food and accommodation of the gangs are satisfactory. He will at once report to superior authority any defect he cannot remedy himself. Committees must assist the officer in charge to visit the gangs by providing him with transport where necessary.

9. Threshing machine owners or farmers employing prisoners will be responsible for their safe custody from the time of starting work in the morning until their return at night. Prisoners must be handed over to the guard in the evening at such time as will permit of their reaching their quarters half-an-hour after sunset.

10. Agricultural Executive Committees must arrange for the conveyance of the rations and equipment of the prisoners and their guard to and from the nearest station, etc., as well as in connection with any intermediate movements. No doubt the threshing machine owner can assist in the case of threshing gangs.

11. The Committee's labour officer should assist with the supervision of the scheme throughout the county, working in close touch with the military authorities.

12. Payment for accommodation, fuel and lighting and any expenses incurred in the conveyance of the equipment and rations must be made by the County Agricultural Executive Committee. In the case of accommodation an appropriate rental should be arranged and in no case should charges exceed 1d. per head per night, including a sufficient supply of good water.

13. The Committee will be responsible for collecting from employers, *i.e.*, the threshing machine owner or farmer, as the case may be, payment for the services of the prisoners at the current local rate for similar work. The Committee must keep a separate account in respect of each gang, and render an account and pay over moneys to the Commandants concerned at the end of each month, after deducting the expenses referred to in paragraph 12.

14. An account of the receipts and payments on the scheme as a whole should also be included in summary form in the quarterly accounts rendered by the Committee to the Food Production Department, the relative service account being entitled the "Prisoners (Migratory Gangs) Employment Account."

THE Food Production Department have issued a Memorandum (No. C. L. 304/M. 4), dated 7th December, 1918, in which they state

**Disposal of Surplus
Food Production
Department Horses.**

that they have decided to sell by auction their in-foal mares in the various counties, and to take the opportunity of exposing at such sales those horses at present loaned to farmers under Scheme "A" F. P. 92, which the Agricultural Executive Committee may deem they can safely spare, having in view the requirements of Scheme "B" and the Prisoner of War Camps, for completing the spring work.

The Department recommend the Agricultural Executive Committee immediately to consult with the leading auctioneers, in order to fix a date for such a sale within the next month, if possible, and arrange for full advertisement. It is thought that farmers who have been using the horses may like to purchase them at the auction, and they should, therefore, be notified direct of the place and date of sale. The name, official number, etc., of the stallion mated with in-foal mares must be advertised, and will be checked by the Department's Register.

No warranty will be given for soundness, but it is important that it should be possible to describe them as fit for agricultural work. All animals will be sold by order of the Food Production Department, and as *temporarily* surplus to the requirements of the Agricultural Executive Committee.

A complete set of plough harness, including the collar in which the horse has been working, must be purchased with the horse at £2. Each set comprises bridle and plough lines, collar and hames, backband, chains, and nosebag.

The instructions in Memorandum (Ref. No. 69/L. 2) of 6th May last,* should be carefully followed.

THE following Memorandum (No. C. L. 306/N. 2) was addressed to Agricultural Executive Committees by the Food Production Department of the Board in December :—

**Coal for Agricultural
Purposes.**

The Controller of Coal Mines has now given instructions that coal required for agricultural purposes, including market gardening, etc., is to be supplied in accordance with the scale set out in the schedule below, and the following procedure should be adopted, as from the date of this memorandum, for obtaining coal for such purposes :—

(a) Persons requiring coal for agricultural purposes should obtain the necessary application form (F. H. F. 9A), specimen attached,† from the Local Fuel Overseer of the Coal Mines Department, from the registered coal merchant, or from the licensed coal dealer to supply.

(b) When completed the application form is to be forwarded to the Local Fuel Overseer who will arrange for the supply

* Not printed in this *Journal*.

† Not here printed.

of coal up to the maximum allowed by the schedule. In certain cases it may be necessary to supply the coal by instalments.

- (c) When any person requires coal in excess of the scale laid down in the schedule, the Local Fuel Overseer will arrange for a supply as in paragraph (b); and as regards the additional quantity will refer the application to the Agricultural Executive Committee or to the person nominated by them for the purpose of investigating and determining such claims on their behalf. A recommendation as to the additional quantity (if any) to be allowed will be made on the form and signed on behalf of the Agricultural Executive Committee; the form will then be returned to the Local Fuel Overseer for necessary action.

In investigating and recommending an application officers and members of the Agricultural Executive Committee must bear in mind that no more than the quantity barely sufficient to meet requirements can be allowed. A wasteful consumer must not be allowed to have any advantage over an economical one, whatever quantity of coal may have been consumed in previous years. In making inquiries a careful investigation must be made and absolute impartiality exercised.

Schedule showing Quantity of Coal to be allowed for Agricultural Purposes.

<i>Purpose.</i>	<i>Quantity.</i>
1. Steam Cultivation	3 cwt. per acre.
2. " threshing only	7 " per day.
3. " threshing and chaff cutting or baling	10½ " ..
4. " pumping	Full quantity required according to the circumstances of each case.
5. Agricultural blacksmiths	
6. Cattle rearing and feeding	80 per cent. of average normal consumption.
7. Pig rearing and feeding	
8. Dairy farming	
9. Cheese making	
10. Poultry keeping	75 per cent. of average normal consumption, subject to a minimum of 100 tons per acre under glass.
11. Other food production purposes	
12. Market gardens and nurseries	75 per cent. of average normal consumption, conditional upon plant being used for food production.
13. Private greenhouses and conservatories	

The expression "average normal consumption" means "the average of the three preceding years or as many of them as are shown on the application form adjusted in respect of any change or circumstances, and of any economies already effected within the three years, and proved to the satisfaction of the Local Fuel Overseer or Local Fuel and Lighting Committee."

THE Board of Agriculture and Fisheries understand that much confusion exists, among the farming community, as to the exact meaning of the announcement made by the President

**Price of Cereals
Guaranteed for 1919.**

of the Board, in the House of Commons,* in which he agreed that the prices paid to farmers for controlled cereals harvested in 1919 will be not less than those now current.

* See this *Journal*, December, 1918, p. 1124.

With a view to removing any misunderstanding that may exist, the Board now inform farmers that the price to be fixed for the 1919 crop of the cereals at present controlled will in no case be less than the prices at present in operation for the 1918 crop. In other words, the commencing prices for the 1919 crop will be at least as follows :—

	s.	d.
Rye and wheat, per qr. of 504 lb. . .	75	6
Oats per qr. of 336 lb.	47	6
Brewing barley, per qr. of 448 lb. . .	70	0
Other barley	67	0

THE following Notice was issued by the Board on 21st December :—

Farmers who have recently been threshing their wheat are finding some difficulty in disposing of it to the millers.

The Board are informed that millers have already purchased home-grown wheat on an extensive scale and are consequently well stocked. The home-grown wheat in many cases has a high percentage of moisture and requires to be mixed off with dry strong wheat of which there is but a small supply in this country, so that the millers' capacity is limited.

The Royal Commission of Wheat Supplies, through the Mills Control Committee, have reduced the milling extraction of home-grown wheat as compared with the extraction of imported wheat in order to give the greater inducement to millers to purchase as much home-grown as possible, and thus minimise the present glut in the market.

The Board of Agriculture are assured that everything possible is being done to meet the situation, and therefore appeal to farmers to proceed with the threshing of oats and barley which are more urgently needed at the moment, and reserve their wheat stocks until the present congestion is relieved.

THE following Press Notice was issued by the Ministry of Food on 12th December :—

**Government Control
of Potatoes :
Modifications in
Distribution Scheme.***

The Food Controller has decided, so far as it is consistent with the undertakings given to growers, to relax the strictness of the Government control of potatoes. In order to give effect to this decision he will issue immediately an Order called the Potato (Consolidation) Order (No. 2), 1918, which will so modify the existing potato distribution scheme as to give greater freedom and latitude on sales by the growers and any dealings by wholesalers and retailers.

The following are the principal modifications :—

1. Growers will no longer require a licence to sell potatoes to retailers or consumers within their zone. The price at which they sell will, however, be the same whoever is the purchaser—that is to say, will be the grower's price fixed for the district, except that a grower may sell lots up to 1 cwt. direct to consumers at any price up to 1d. per lb.

* See also this *Journal*, September, 1918, p. 708, and December, 1918, p. 1114.

2. The flat price for potatoes to retailers and consumers will be abolished and wholesale dealers and retail dealers will sell on margins in the same way as last year. The wholesale dealer's commission will be averaged over four weekly periods, the first period beginning on the 16th December. During any such period the dealer's average profits must not exceed 4s. per ton for sales to other wholesale dealers, and 10s. per ton for sales to retail dealers and consumers. The potatoes must in no case pass through the hands of more than two wholesale dealers, and any wholesale dealer who obtains potatoes through his Potato Control Committee may not re-sell them to another wholesale dealer.
3. The maximum retail price will vary with the retailer's buying price in accordance with the Schedule given below.* The buying price for the purpose of the Schedule is the sum of the two following items :—
 - (a) The actual price paid for the potatoes by the retailer excluding any sum paid as deposit on bags.
 - (b) Any sum borne by the retail dealer in having potatoes carted to his shop. If he carts the potatoes in his own van he may include a reasonable sum not exceeding 5s. per ton for this service.
4. The movement of ware potatoes from surplus to deficit zones will be controlled by the Ministry of Food as at present, but pig potatoes will be allowed to move freely from one zone to another. In the following cases, ware potatoes may be removed from one zone to another without a licence :—
 - (a) A grower may cart his potatoes to any place in any other zone within 5 miles of his farm.
 - (b) Potatoes grown in Essex, Middlesex, Hertfordshire and Bedford, may be sent into London unless they are loaded at railway stations in other zones.
5. Wholesale dealers in deficit zones who cannot obtain sufficient supplies of potatoes from within their own zone will indent on their Potato Control Committee or Market Committee for supplies from other zones.

These potatoes will be classified in four grades as follows :—

- Grade I.—King Edwards grown on silt, warp, limestone and Highland clay.
- „ II.—All other varieties grown on these lands.
- „ III.—King Edwards grown on fen, skirty and sand lands.
- „ IV.—All other varieties grown on these lands.

Wholesale dealers should apply to their Potato Control Committee or Markets Committee for particulars of the prices at which these potatoes will be sold and should indent on the Committee for their requirements of each grade.

At the same time it has been decided, in view of the abnormal development of blight in the Eastern Counties and other special circumstances since the date on which the growers' prices were fixed by the Joint Commission of the Ministry of Food and the Board of Agriculture, to revise the growers' prices in the counties chiefly affected as follows :—

* Not here printed.

*Prices for December for King Edward
and Langworthy group.
Best land (silt, warp,
limestone and Highland Other land.
clay).*

	£	s.	d.	£	s.	d.
Lincoln	7	0	0	6	10	0
Norfolk	7	0	0	6	10	0
Cambridge and Hunts ..	7	0	0	6	5	0
Soke of Peterborough ..	7	0	0	6	10	0
Yorkshire	7	0	0	6	10	0

The prices for other varieties of potatoes will be 10s. per ton less than the above, whilst the prices for all varieties will be increased after the end of December by the amounts indicated in the Commission's report.*

The riddle for ware potatoes grown in Nottinghamshire will be reduced from $1\frac{1}{8}$ in. to $1\frac{1}{2}$ in.

THE following Press Notice was issued by the Food Controller on 14th December :—

**The Seed Potatoes
Order, 1918†.**

This Order, which will come into operation on the 16th December, does not prescribe maximum prices to be paid to the grower, rates of commission on sales by merchants or retailers, or the size of riddle to be used in dressing potatoes for sale as or for "seed." The Order requires a written declaration to be furnished by the vendor to the buyer on the sale of potatoes as or for "seed."

The declaration must state the class and variety and dressing of the potatoes sold. In cases where seed potatoes are sold from crops immune from wart disease, they must be certified as reasonably free from rogues by the Board of Agriculture, or by the Board of Agriculture for Scotland. The declaration must also state the serial number of the relative certificate

For the purpose of this Order the classes of potatoes sold as or for "seed" are :—

- | | |
|--------------------|-------------------------|
| Class I. (Scotch). | Class II. (once grown). |
| Class I. (Irish). | Class III. |

The "Class I (Scotch)" includes only potatoes grown in Scotland.

The "Class I. (Irish)" includes only potatoes grown in Ireland.

The "Class II. (once grown)" includes only potatoes grown in England or Wales in respect of which documentary evidence can be produced showing that they were grown in the year 1918 from seed grown in Scotland or Ireland in the year 1917.

"Class III." includes all other potatoes.

This Order does not apply to potatoes sold in Ireland for planting in Ireland.

DURING 1918, the Food Production Department distributed to allotment holders, small holders, and others in England and Wales, 32,000 tons of seed potatoes—13,000 tons being varieties immune from Wart Disease.

Seed Potatoes.

In addition, 9,200 tons were shipped to the British Expeditionary Forces for planting in France or at Salonica; and 1,600 tons were supplied to the Allied Governments

* See this *Journal*, December, 1918, p. 1116.

† Order No. 1604, dated 6th December, 1918.

A SURVEY of the whole of the counties of England and Wales was undertaken lately by the Food Production Department in order to ascertain in what areas Wart Disease exists.

**Wart Disease
of Potatoes.**

As a result 68 districts have had to be certified as infected areas under the Wart Disease of Potatoes Order, 1918.* Among the areas so certified are a district including the county of Glamorgan and parts of the county of Monmouth, Carmarthen, and Brecon; the whole of Lancashire south of the River Ribble; and a number of parishes in the counties of Nottingham and Derby. The county of Stafford is to be declared an infected area as and from 1st January, 1920.

THE Food Production Department announce that they have had under consideration the policy to be adopted this year in regard to the growing of mustard for seed. In consequence of the action taken by Agricultural Executive Committees, the acreage in England and Wales devoted to this crop has been reduced from 51,907 acres in 1916 to 9,999

**Mustard for Seed:
Arrangements for
1919 Crop.**

acres in 1918, with the result that a considerable additional acreage was made available for more essential food crops during the war emergency. The Department are of opinion that it is now possible to allow some relaxation of the restrictions. The crop is a profitable one to farmers and it is also important to maintain the export trade, which is of considerable value. It has been decided, therefore, that an area of 20,000 acres should be allowed for the harvest of 1919, but that half of this area should be grown on land ploughed out of grass for the purpose. Mustard for seed is a very suitable first crop to be grown on newly ploughed grass land; and it is believed that many farmers would be prepared to break up grass land if they were allowed to use the land for growing mustard for seed. The Board have made a general Order prohibiting the growth of mustard for seed except under the authority of a licence granted by Agricultural Executive Committees. This Order is dated 30th November, 1918, and is as follows:—

Order Restricting Growth of Mustard for Seed—

1. This Order is applicable to England and Wales generally.
2. Except under the authority of a licence granted by the Agricultural Executive Committee exercising powers conferred upon the Board by Regulation 2M of the Defence of the Realm Regulations in the Administrative County or County Borough in which the land is situate, land shall not be used for the cultivation of mustard for seed in the year nineteen hundred and nineteen.
3. Any occupier of a holding aggrieved by the refusal of the Committee to grant a licence under this Order may by notice in writing, given to the Committee within one calendar month from the date of the refusal, require that the question whether it is undesirable in the interest of food production that the change in cultivation required by this Order should apply to any portion of his holding, shall be referred to arbitration under and in accordance with the provisions of the Second Schedule to the Agricultural Holdings Act, 1908, except that the

* Printed in this *Journal*, May, 1918, p. 212.

arbitrator shall be nominated in default of agreement by the President of the Surveyors' Institution.

4. In the case of land situate in a County Borough within which no such Committee exercises the said powers the Board shall be substituted for the Committee for the purposes of this Order.

By an Order, No. 1667, dated 18th December, 1918, the Food Controller revokes the undermentioned Orders (among others to which reference has not previously been made in this *Journal*) to the extent specified, but

**Removal of
Restrictions Affecting
Farmers.**

so that such revocation shall be without prejudice to any proceedings in respect of any contravention thereof.

Order Revoked.	Extent to which Revoked.	Page of <i>Journal</i> in which Order was Published.
No. 376 of 1917. The Wheat, Rye and Rice (Restriction) Order, 1917.	Only to the extent to which the Orders relate to rye and to tailings, dressings and screenings of rye.	May, 1917, p. 236.

An Order, No. 1639, dated 12th December, 1918, issued by the Food Controller, authorises the feeding of horses falling within the Fourth Schedule to the Horses (Rationing) No. 2

Horses Rationing
Order: General Licence. following rates:—

<i>Class of Horse.</i>	<i>Maximum Daily Ration in terms of Oats.</i>
Horses, 15 hands and over	7 lb.
Horses, 14 hands and under 15 hands	6 „
Horses, under 14 hands	4 „

Provided that as regards such horses the records mentioned in Clause 6 of the Order are kept and are open to inspection as provided by that Clause.

For the purposes of this licence cereal foodstuffs other than oats may be used in the proportions mentioned in Clause 4 of the Order.

AN Order (No. 1671), dated 18th December, 1918, has been issued by the Food Controller to the following effect :—

**The Cattle Feeding
Stuffs (Distribution)
Order, 1918: General**

*** Licence.***

Where a person who is named as a supplier in any certificate or certificates granted under this Order has supplied or has made provision for the supply of such quantities of the cattle feeding stuffs set out in the Schedule hereto as are mentioned in every such certificate, he may, without regard to the restrictions imposed by the Order, dispose in such manner as he shall think fit of the residue of such cattle feeding stuffs remaining in his hands, and such cattle feeding stuffs may be acquired by any other person accordingly.

THE SCHEDULE.

Flour Millers' Offals and Screenings.	Maize Germ Meal.
Barley Millers' Offals.	Hominy Chop.
Oatmeal Millers' Offals.	Flaked Maize.
Grist Meals.	Brewers' Grains.
Molassed Feeds.	Distillers' Grains.
	Malt Culms.

WITH reference to the manufacture and sale of compound cakes and meals, arrangements have now been made by the Ministry of Food for standardising the feeding value of these products.

**Standardisation of
Compound Cakes and
Meals.**

Makers will not be permitted to manufacture except under the terms of a licence which sets out the ingredients that may be used. The arrangements under which manufacturers of compound cakes and meals will make these products have been discussed with the Feeding Stuffs Sub-Committee of the Central Agricultural Advisory Council, who expressed themselves satisfied that the Regulations would secure the manufacture of cakes and meals of satisfactory quality. A list of the permitted ingredients is printed below.

THE SCHEDULE.

PART I.

A.—Compound Cakes or Meals shall contain :—

- (1) Not more than 80 per cent. in all either alone or in mixture of any cake or meal, manufactured from any oleaginous seed, nut, or kernel, other than rape seed, linseed, or castor seed. No linseed or castor seed, cake or meal, and not more than $12\frac{1}{2}$ per cent. of cake or meal shall be used in the manufacture of compound cakes or meals.
- (2) Not less than 5 per cent. or more than 10 per cent. of treacle.
- (3) Not less than 15 per cent., in all made up of any one or more of the articles set forth in Part II. of this Schedule.

B.—Compound Pig Meal shall contain :—

- (1) 65 per cent. of palm kernel cake, or meal.
- (2) 35 per cent. in all made up of one or more of the articles specified in Part II. of this Schedule other than those marked "X."

C.—*Compound Calf Meal* shall contain :—

- (1) 65 per cent. linseed cake or linseed cake meal.
- (2) 35 per cent. of any one or more of the following articles :—

Beans, biscuit offal, farina, ground nut cake meal, locust beans, maize and maize products, millers' offals (fine), oatmeal, peas, rye flour, sago flour, tapioca flour, wheat flour.

PART II.

Acorn meal.	Locust beans.
Almond skins.	Locust bean meal.
Apple pumice (dried).	Macaroni.
Bakers' siftings.	Maize residue.
Barley offal.	Maize meal.
Beans.	Maize cake.
Bean meal.	Makbar.
Beechmast kernels.	Malt dust.
Biscuit offals.	Malt culms.
Blood (dried).	Manioca flour.
Bone meal (green).	Meat meal.
Chestnut (edible).	Molascuit.
Chocolate offals.	Molassstelle.
Clover screenings.	Molassine.
Cocoa powder.	Oats.
Cod liver oil.	Oatmeal.
Coroso nut screenings.	Offals (millers' other than husks or shudes).
X Cotton seed (damaged).	Oil foots from crude vegetable oil.
Coffee meal residue.	Paisley meal.
Distillery meal (dried).	Peas.
Distillery by-products.	Pea shells.
Farina.	Potato residues.
Fig residues.	Raisin residues.
Flour screenings.	Rice bran.
Fruits (dried).	Rice meal (not including rice husks).
Flax seed.	Sago flour.
Gluten meal.	Salt (not exceeding 2 per cent.).
Grain, flour, and tail corn (damaged).	Soda carbonate of spices.
Grains (brewers' and distillers' dried).	Tares.
X Grass seeds.	Tapioca root flour.
Hops (dried).	Treacle.
Hops, spent (dried).	Trefoil ground seed.
Hop meal.	Tomato residues.
Lentil bran.	Wheat screenings.
Linseed screenings.	Wheat (kiln dried).
Linseed (damaged).	Yeast (dried).

THE following Notice was issued by the Joint Committee of the Board of Agriculture and the Ministry of Food on 28th November :—

The Use of Brazilian Beans for Feeding Purposes.

A certain quantity of Brazilian beans has been recently placed on the market for use as cattle food. Complaints have been received from various quarters that these beans have proved to be particularly unsatisfactory as a feeding stuff, and as in Brazil they are used as human food, it was

necessary to discover the origin of the complaints as to the unsuitability of the beans as cattle food.

The beans are brown in colour and about the size and shape of a small haricot bean. An analysis showed the composition to be as follows :—

Water	14 per cent.
„ Fat	2 „
Protein or flesh-former	21 „
Carbohydrate or starch	55 „
Woody fibre	4 „
Ash	4 „

There was complete absence of any poison and the analysis showed that the beans should prove of good feeding value.

The analysis having indicated its value as a wholesome cattle food, attention was directed to the feeding methods adopted, and it quickly became evident that the trouble which has arisen in the use of this bean has been due to the fact that farmers have not boiled, steeped or soaked the meal previous to feeding. Consequently, the feeding stuff has swelled after the cattle have eaten it and caused digestive trouble. It is, therefore, essential that, if used in any quantity, the bean or the meal made from it should be thoroughly soaked before use.

Provided that this is done, the meal or the bean will prove to be excellent for feeding purposes.

In the case of poultry, it has been noticed that fowls refuse to eat the bean whether crushed or not, but if boiled and mixed with the hot mash, excellent results will be obtained.

AN ORDER (No. 1038), dated 12th December, 1918, has been made by the Food Controller to the effect that :—

The Meat (Dealers' Restriction) Order, 1918.

(a) A person who deals in meat whether by wholesale or by retail shall not buy or obtain, or attempt to buy or obtain for the purposes of his business as a dealer in meat any live stock or meat unless he is the holder of a permit issued by or by the authority of the Food Controller and for the time being in force (hereinafter called a buying permit).

(b) Nothing in this Clause shall preclude a caterer from obtaining meat for the purposes of his catering establishment in compliance with Clause 14 of the Rationing Order, 1918.

Except as provided by (b) a person shall not sell or supply, or offer to sell or supply any livestock for slaughter or meat to any dealer in meat (other than the holder of a buying permit) for the purposes of his business as such dealer.

The remainder of the Order deals with permits, limitation of sales, keeping of records, offences, etc.

WITH reference to the Note on the increased prices for cattle and sheep which was published on p. 1025 of the issue of this *Journal* for November last, the increased prices for sheep given therein are incorrect after January, and the following figures should be substituted :—

Increased Prices for Cattle and Sheep.

Further, the sentence in the last paragraph on p. 1026 “..... the above prices may (except in the case of fourth-grade cattle) be varied by 1s., 2s., or 3s.” should read “..... the above prices may (except in the case of fourth-grade cattle which are sold in accordance with the Order, but, in no case at a price exceeding 55s.) be varied by 1s., 2s., or 3s.”

THE following Notice was issued by the Food Production Department of the Board on 3rd January :—

The Government is offering a certain amount of nitrate of soda for delivery in the early months of 1919, for agricultural purposes, at the price to farmers of £20 per ton, in bags. This price is for quantities of not less than 2 tons, delivered to purchaser's nearest railway station in Great Britain.

The minimum quantity accepted for delivery direct from Government store to purchaser's or consumer's station, according to the Food Production Department, will be not less than 2 tons; but smaller quantities may be bought from the stores of agricultural merchants or co-operative societies. In these cases, special additions to the above-mentioned price have been authorised.

Farmers who desire to purchase nitrate of soda should place their orders at once with merchants or societies, from whom full details of the Government offer can be obtained.

THE Food Production Department announced, on 6th December, that the Ministry of Food is notifying Food Control Committees that the produce as well as the meat of goats is ration free. This statement means that any butter which may be manufactured from the milk of goats, as well as the milk itself, may be sold to anyone without the buyer being required to surrender a butter-margarine coupon.

Notice to Goat-keepers.

THE following Notice was issued by the Board on 27th December :—

Agricultural Training for Service Men : Board of Agriculture Grants.* With reference to the official announcement which appeared in the Press of the 14th December, 1918, on the subject of Higher Education and Training for those who have served in the Forces, the Board of Agriculture and Fisheries make the following announcement in connection with the training for agriculture of officers upon re-settlement in civil life.

The Board have framed a scheme under which :—

(a) Allowances of £125 per annum for two years may be granted to a considerable number of officers who wish to farm on their own account in this country on completion of training, so as to enable them to obtain practical agricultural experience and training with selected farmers throughout England and Wales ; and

(b) Scholarships of varying values up to £175 per annum and fees, for three years, may be given to a small number of officers who have had either previous experience of farming or a scientific education, or both. These scholarships will be held at an approved University or Agricultural College in England or Wales, and are intended for candidates who, on completion of their training, may wish to obtain salaried posts as agricultural organisers, teachers of agriculture, county instructors, managers, etc.

In both the above cases additional allowances may be made to officers married before the date of the Armistice, 11th November, 1918, at the rate of £24 per annum for each child up to and including the age of 15 years ; but the maximum payment under this head is limited to £96 per annum for any one officer.

These scholarships and allowances are, of course, not intended for officers whose financial circumstances render them independent of Government assistance.

* See also article on p. 1152.

The Board propose to place in the hands of the Local Authorities throughout England and Wales the award of the allowances mentioned at (a) above, and the detailed administration of that part of the scheme. The necessary arrangements for this purpose are now being made.

The award of the scholarships mentioned at (b) above will be made on the recommendation of a Committee appointed by the President of the Board, consisting of:—

Professor T. B. Wood, C.B.E. (*Chairman*),
 The Lord Bledisloe, K.B.E.,
 Mr. A. B. Bruce, M.A.,
 Professor C. Bryner Jones, M.Sc.,
 Mr. C. Home McCall, O.B.E.,
 Sir T. H. Middleton, K.B.E., C.B.,
 Mr. S. Sherwood,
 Mr. F. Watson,
 With Mr. T. J. Young (*Secretary*).

This Committee will also advise and assist the Board generally in regard to the execution of both parts of the scheme.

A booklet (L. S. 9) is about to be issued by the Board giving particulars of the scheme and explaining, so far as is now possible, the steps that have been or will be taken to settle officers on the land after the War. This booklet will be issued before demobilisation to officers who, on Army Form Z 15 or Navy Form S 1299, state that they desire agricultural training, and it will also be obtainable after the 12th January, 1919, from the various District Directorates of the Appointments Department of the Ministry of Labour. It will contain a form of application for a training allowance or scholarship which should be completed by any officer who desires to be a candidate, and dealt with as directed in the booklet.

The term "officers" for the purpose of this scheme includes warrant officers, non-commissioned officers, and men in the ranks, provided they are of suitable educational promise.

THE following letter was addressed to County Councils and Councils of County Boroughs by the Board on 18th December:—

**Land Settlement of
Ex-Service Men.**

SIR,—1. I am directed by the President of the Board of Agriculture and Fisheries to invite the immediate attention of the Small Holdings and Allotments Committee of your Council to the urgent question of the means to be adopted for enabling ex-service men to obtain land for settlement in this country.

2. As the Council are aware, the provision of land by purchase under the Small Holdings and Allotments Act has been suspended during the War owing to the fact that the Treasury were unable to allow loans to be raised for the purpose. In view, however, of the termination of

the War, and the approaching demobilisation of the Forces, it is urgently necessary that provision should be made, without delay, for those men who desire to settle on the land in this country, and the Board have therefore urged upon the Government the necessity of removing at once the restrictions on the purchase of land.

3. The necessary financial arrangements have not yet been finally settled, but the Board are in a position to say that while it is hoped that as much land as possible will be acquired for a perpetual annuity, the Government have agreed that as this method cannot be adopted on a considerable scale without further legislation, funds will be provided in the meantime enabling County Councils, subject to the approval of the Board, to purchase land for cash for the settlement of ex-service men.

4. The Government have also decided that while the Board may continue to acquire land for the establishment of colonies under the Small Holdings (Colonies) Acts if suitable opportunities offer, the County Councils, as the statutory authorities for the provision of small holdings, should be asked to undertake the main responsibility of supplying the demand for land for settlement by ex-service men. The Board feel sure that they can confidently rely on your Council to undertake this honourable and responsible duty with the utmost vigour and enthusiasm.

5. The Board recognise that prevailing financial and economic conditions render it impossible to provide and equip land as small holdings to be let at rents sufficient to recoup the whole of the capital outlay. It is clear, therefore, that there must be financial assistance from public funds on a considerable scale, and the Government have agreed to this in principle. The terms and conditions on which such assistance will be given are still under consideration, but pending their settlement the Board are anxious that no opportunities should be lost of acquiring any suitable land which can be obtained at once at reasonable prices.

6. The Board are satisfied that land should be acquired in advance of any actual ascertained demand. It is certain that the demand will be considerable, and if suitable land is acquired in suitable districts there is no danger of any lack of suitable tenants by the time it has been equipped and the holdings are ready for occupation.

7. I am directed to ask, therefore, that the Small Holdings and Allotments Committee will proceed at once to consider what land can be acquired in your County for the settlement of ex-service men, and that they will submit any proposals to the Board for their sanction.

8. As far as possible land should be secured in sufficiently large blocks to ensure the development of colonies of small holders who could be organised on co-operative lines, and in selecting land special attention should be given to the suitability of the soil, proximity to markets, transport facilities, opportunities of alternative employment and any other factors that will conduce to success. At the same time smaller areas suitable for the settlement of a few men should not be neglected.

9. In selecting land for settlement the co-operation and assistance of the Agricultural Executive Committees should be invited. Those committees are carrying out surveys of the land in their counties, and they will often be able to suggest suitable land that might be acquired for settlement. Special consideration should also be given to any farms comprising good land which is not being properly farmed, and landowners should be invited to inform the Council of any farms which will shortly become vacant, so that as far as possible the disturbance of tenants who are farming well should be avoided.

10. Councils should not wait until offers of land are received nor should they confine themselves to land which is actually in the market. They should themselves select land in those districts which are most suitable for the establishment of successful small holdings, and should negotiate at once for the acquisition of such land.

11. It is hoped that a considerable quantity of land may be acquired by voluntary agreement, but Councils will remember that they have powers of compulsory acquisition and they should not hesitate to exercise them whenever necessary.

12. In view of the magnitude of the task it is essential that the Small Holdings and Allotments Committee should be adequately staffed. In many Counties the Small Holdings office has been closed down and the staff dispersed, and it is necessary that it should be reconstituted at once under a competent whole-time county land agent. The Board will give any assistance in their power to secure the return to their posts of any members of the small holdings staff of your Council who are serving in the Army. Expenditure on staff engaged for this work, which is approved by the Board, will be brought into account for the purpose of arriving at the amount of the contribution which the Government will make to the Councils.

13. The Board think also that Councils should make use of their power of appointing on their Small Holdings and Allotments Committee persons who are not members of the Council, in order to secure the assistance of men who are specially interested in the question of land settlement, but who may not be County Councillors. It is desirable, for instance, that every Small Holdings Committee should include at least one representative of labour.

14. With regard to the equipment and adaptation of any land acquired for settlement, I am to say that while the Board desire to impose as little departmental control as possible, it is obvious that for some time to come there must be central supervision of any building operations by local authorities. The Board will have to bear a considerable proportion of the cost and must therefore be able to satisfy themselves that all possible economies are secured in the provision of materials and fittings, while at the same time it is essential to avoid the erection of cheap cottages which would disfigure the countryside. Difficult questions connected with priority in the supply of materials will also arise, which can only be dealt with by a central authority. The Board are arranging to give County Councils all possible assistance in regard to the design and plan of suitable cottages and buildings for small holdings, and a further communication will be sent to you shortly on this subject, and also as to the arrangements which Councils will have to make with regard to architectural assistance.

I am, etc.,

(Signed) A. D. HALL, *Secretary*

THE following Notice was issued by the Food Production Department of the Board on 31st December :—

**Price of Binder
Twine.**

Statements are appearing in the Press to the effect that the Food Production Department has fixed the price to be charged for binder twine for the 1919 harvest. This is not the

case. No price has been fixed by the Government, and a definite notice was issued in the Press early in December stating that it was not proposed to control the price of binder twine required for the 1919 harvest. Agricultural merchants and dealers should, therefore, obtain quotations from different sources in order to buy in the cheapest market.

THE following Notice was issued by the Board on 7th December :—

The President of the Board of Agriculture and Fisheries desires to call attention to the fact that one of the chief objects of the recently passed Tithe Act is to facilitate and encourage the redemption of tithe rentcharge, corn rents, etc.

**Redemption of Tithe
Rentcharge,
Corn Rents, etc.**

The new Act provides that the amount of the consideration money payable on redemption may, under certain conditions, be agreed between the tithe-owner and the landowner, and, failing such agreement, may be determined by the Board of Agriculture and Fisheries.

According to the method of calculation prescribed by the Act for cases in which the Board determine the amount, the consideration money for redemption at the present time in an average case is approximately 18½ years' purchase of tithe rentcharge attached to a benefice, and 16½ years' purchase of other tithe rentcharge.

Full particulars of the new procedure will be supplied on application to the Board.

THE following Memorandum (No. C. L. 104/C. 1) was addressed to Agricultural Executive Committees by the Food Production Department of the Board on 9th December :—

Wood Pigeons.

The Board desire to urge on Agricultural Executive Committees the desirability of making arrangements for a week to be set apart for the purpose of pigeon-shoots.

Last season many committees organised shoots, but their independent action was not nearly so effective as would have been the case had simultaneous shooting taken place.

In spite of the efforts made in several counties much injury was done by these birds during the present year, and the Board hope that by extended action, better organisation and co-operation, it will be possible to reduce the damage by wood pigeons next year (1919).

THE following Notice was issued by the Board on 4th January :—For 16 years the British Islands have been free from Rabies (Hydrophobia or Dog Madness).

Rabies.

It has been reintroduced in 1918 by the agency of some dog smuggled in from abroad, but it may be expected that the Regulations now enforced round the infected port and area will in time be effective in stamping out this outbreak.

Meantime, with the return from the various fronts of the fighting forces and of the many services both of men and of women that have accompanied them, there is grave danger of the introduction of the disease into other parts of the country if dogs are brought back. Rabies is prevalent among dogs and other animals in every country in which fighting has been going on; it is common in France. It is one of the most horrible diseases that men or dogs can be exposed to. The danger of spreading it is greatly increased by the fact that the disease may not show itself for months after a dog has been infected by a bite. A dog owner in a country in which rabies exists may be genuinely convinced that his dog has never been exposed to infection and is in perfect health, and yet it may be a carrier of the disease. When the disease flares up the dog usually runs amok and bites a succession of other dogs before he dies, thus establishing a chain of infection that is very difficult to suppress. The Board of Agriculture enforce a detention of six months and veterinary inspection on duly registered premises on all dogs entering the country from whatever part.

Anyone now serving abroad and owning a dog there ought to consider seriously whether he or she will be justified in trying to bring it home. The detention in quarantine is under the best conditions a term of imprisonment for the dog. It is expensive for the owner, and it consumes labour and food which are badly needed in other directions. The Board of Agriculture ask all owners of dogs abroad to weigh these considerations. In the best interests both of the dogs in question and of dogs at home, and of the public safety, they are advised not to bring any dogs home with them.

Above all, the Board of Agriculture ask for the co-operation of all officers and men returning from service abroad to check the attempts to smuggle in dogs which have undoubtedly been made and have indeed resulted in rabies breaking out in Devon.

No man would willingly bring a mad dog into the country, but no man coming from a country in which rabies exists can be sure that his dog has not been infected and will not go mad.

The risk is real as the Devon outbreak shows, and the only way of preventing further outbreaks with their accompaniment of miserable deaths for many dogs and even human beings is that men and women of all ranks returning home will realise the danger attaching to dogs brought from abroad and will loyally help the authorities to secure that no dog enters the country except openly and with a proper licence.

THE Board desire to give notice that the Rules and Regulations for the show of thorough-bred stallions suitable for getting half-bred horses, to be held at The Park Paddocks, Newmarket, in conjunction with the Hunters' Improvement and National Light Horse Breeding Society, on 4th and 5th March, 1919, may be obtained on application at the Board's Offices, 4, The Sanctuary, Westminster, London, S.W. 1. The last day for entry to the Show is 27th January, 1919; and no stallion can be accepted for entry until it has been registered by the Board.

In the Book of Rules and Regulations will be found details as to the District Classes for England and Wales, the regulations applicable to the Show and to the Annual Registration of Stallions; and also information as to the award of the Board's premiums.

THE War Office are handing over to the Board a number of Army mares of light draught and hunter type for placing out with Custodians for breeding purposes. The mares will be under ten years of age and free from hereditary disease, and will be approved by representatives of the Board before being accepted as suitable for the purpose in view. The Board have asked the Agricultural Executive Committees in England and Wales to supply them with lists of suitable Custodians for the light draught mares, and the Hunters Improvement and National Light Horse Breeding Society and the Light Horse Breeding County Committees to recommend Custodians for mares of hunter type. The mares will be placed out under prescribed conditions, a summary of which is given below:—

Annual rental of £2 payable in advance.

First payment due on the day that mare is received, and on 1st April in each subsequent year.

Mare to be served annually by a stallion approved by the Board.

The Board and War Office will have a lien on the progeny when three years old at £50, and no progeny can be sold without permission until 1st October in the year in which it is three years old. Exemption can be claimed on the payment to the Board of a forfeit of £10.

The Board reserve the right of inspection of mare and progeny, and the return of the mare if the conditions are not carried out.

A Custodian may surrender a mare on giving one month's notice to the Board.

Copies of the relative conditions and of the application forms may be obtained on application to the Secretary, Board of Agriculture and Fisheries, 4, The Sanctuary, Westminster, London, S.W. 1.

THE existence of foot-and-mouth disease amongst animals on premises at Littlethorpe, near Ripon, Yorkshire (West Riding), has been confirmed to-day. The usual precautions have been taken to prevent the spread of the disease, and an Order has been made prohibiting the movement of animals in a large area surrounding the infected farm.

THE Food Controller, by an Order (No. 1692), dated 19th December, 1918, has revoked the Pigs (Sales) Order, 1918.* The effect is to remove most of the restrictions on the slaughter and sale of pigs, including the obligation to sell pigs in markets.

Orders affecting the Slaughter and Sale of Pigs.

It is also prescribed, by an Order (No. 1704), dated 20th December, 1918, entitled the Pigs (Prices) Order (No. 2), 1918, that (a) where a person sells for slaughter any live pig otherwise than by dead weight, the maximum price shall be at the rate of 21s. per score of the live weight, and (b) where a person sells for slaughter any live pig by dead weight or sells any dead pig, the maximum price, if the offals are included in the sale, shall be at the rate of 28s. per score of the dead weight, and if the offals are not included in the sale, shall be at the rate of 26s. 6d. per score of the dead weight.

MISCELLANEOUS NOTES.

THE *International Crop Report and Agricultural Statistics* for December, 1918, published by the International Institute of Agriculture,

Notes on Crop Prospects and Live Stock Abroad.

gives particulars concerning the production of the cereal crops of 1918 in certain countries in the Northern Hemisphere. *Wheat*.—The production in Spain, United Kingdom, Italy, Luxemburg, Netherlands, Sweden, Switzerland, Canada, United States, British India, Japan, Egypt, and Tunis is estimated at 250,813,000 qr. in 1918, against 211,994,000 qr. in 1917, or an increase of 18·3 per cent. *Rye*.—The estimated production in Spain, Ireland, Italy, Luxemburg, Netherlands, Sweden, Switzerland, Canada, and United States is placed at 18,699,000 qr. in 1918, or an increase of 31·3 per cent. compared with 1917, when it amounted to 14,245,000 qr. *Barley*.—The production in Spain, United Kingdom, Italy, Luxemburg, Netherlands, Sweden, Switzerland, Canada, United States, Japan, Egypt, and Tunis is estimated to amount to 71,309,000 qr. in 1918, against 64,976,000 qr. in 1917, or an increase of 9·7 per cent. *Oats*.—It is estimated that the total yield in Spain, United Kingdom, Italy, Luxemburg, Netherlands, Sweden, Switzerland, Canada, United States, Japan, and Tunis amounted to 257,122,000 qr. in 1918, against 250,079,000 qr. in 1917, or an increase of 2·8 per cent. *Maize*.—The production in Spain, Italy, Switzerland, Canada, United States, and Japan is estimated at 332,840,000 qr. in 1918, against 382,094,000 qr. in 1917, or a decrease of 12·9 per cent.

In the Southern Hemisphere, the production of wheat in Australia in 1918-19 is estimated to amount to 10,100,000 qr. against 14,417,000 qr. in 1917-18 or a decrease of 29·9 per cent.

Denmark.—According to official estimates the crops of 1918 are as follows, the figures for 1917 being given in brackets:—Wheat, 799,000 (537,500) qr. (480 lb.); barley, 2,567,000 (2,144,000) qr. (400 lb.); oats, 4,376,000 (3,963,000) qr. (304 lb.); rye, 1,482,000 (1,033,000) qr. (480 lb.); potatoes, 325,000 (867,000) tons (2,204 lb.). (*Broomhall's Corn Trade News*, 24th December, 1918.)

Italy.—According to the preliminary official estimate the yield of maize is given as 7,800,000 qr. against 8,780,000 qr. last year, and 10,966,000 qr., the average of the five years, 1912-16. (*The London Grain, Seed and Oil Reporter*, 11th December, 1918.)

Sweden.—According to preliminary official estimates the yields of this year's principal crops are as follows, last year's figures being given in brackets :—Wheat, 826,600 (857,700) qr. from 376,675 (326,040) acres; barley, 1,642,000 (1,175,400) qr. from 452,010 (437,190) acres; oats, 6,807,000 (7,065,000) qr. from 1,783,340 (1,931,540) acres. (*The London Grain, Seed and Oil Reporter*, 13th December, 1918.)

Malta.—According to a Consular report for 1917 the total area of land under cultivation was 42,849 acres, as against 42,687 acres in 1916-17. The yields of the principal crops are as follows, the figures for 1916-17 being given in brackets :—Wheat, 39,441 qr.; barley, 18,708 qr.; mixed corn, 5,230 qr. the total area under cereals being 20,107 (18,330) acres; beans and pulse, 4,410 (3,430) qr. from 2,742 (2,005) acres; potatoes, 14,540 (9,545) tons from 2,718 (3,190) acres; onions, 2,958 (6,054) tons from 819 (1,279) acres. (*Broomhall's Corn Trade News*, 14th December, 1918.)

Canada.—According to the official report issued by the Dominion Bureau of Statistics on 19th November, the total area planted with field potatoes in 1918 was 735,192 acres, as compared with 656,958 acres in 1917, both years establishing records. The estimated total yield for 1918 (the highest on record) is 105,579,700 bush. as against 79,892,000 bush. in 1917, being a yield per acre of 143½ bush., as against 121½ bush. in 1917, and a decennial average of 150½ bush. The total yield of turnips and other roots is estimated at 120,767,900 bush. from 343,037 acres, an average per acre of 352 bush., the figures for 1917 being 63,451,000 bush. from 218,233 acres, an average of 290½ bush. Hay and clover give the record yield of 14,595,500 tons from 10,544,625 acres, an average per acre of 1½ tons, the corresponding figures for 1917 being 13,684,700 tons from 8,225,034 acres, or 1½ tons per acre. The estimated yield of fodder corn is 4,203,150 tons from 502,069 acres, an average per acre of 8½ tons. The total area under root and fodder crops, including potatoes, turnips, etc., hay and clover, alfalfa and fodder corn, amounts to 12,321,351 acres, as compared with 9,576,508 acres in 1917. The area estimated to be sown with autumn wheat for 1919 is 5 per cent. less than the revised estimate of the area sown in 1918 (886,000 acres), but 18 per cent. more than the original estimate for 1918 (711,000 acres). On 31st October the condition of the autumn wheat crop was 102 per cent. of the decennial average. About 56 per cent. of the land intended for the 1919 crops has been ploughed during the autumn, this proportion being similar to that of the last three years.

United States.—According to the final report on the crops of 1918, issued by the Bureau of Statistics of the Department of Agriculture on 11th December, the production of the principal crops and the number of acres harvested are as follows, figures for 1917 being given in brackets :—Wheat, 917,000,000 (651,000,000) bush. from 59,110,000 (45,941,000) acres; barley, 256,000,000 (209,000,000) bush. from 9,679,000 (8,835,000) acres; oats, 1,538,000,000 (1,587,000,000) bush. from 44,400,000 (43,572,000) acres; rye, 89,000,000 (60,000,000) bush. from 6,185,000 (4,102,000) acres; maize, 2,583,000,000 (3,159,000,000) bush. from 107,494,000 (119,755,000) acres; flax seed, 14,657,000 (8,473,000) bush. from 1,938,000 (1,809,000) acres. According to the report on the 1919 crops the condition of the growing winter wheat crop on 1st December is estimated at 98.5 per cent., compared with 79.3 last year; that of rye, at 89.0 per cent., compared with 84.1 per

cent. a year ago. The estimated area sown with winter wheat is 49,403,000 acres, against 42,170,000 acres last year, and an average of 32,300,000 acres for the five years 1910-14; rye, 6,820,000 acres, against 6,119,000 acres last year, or more than double what it was before the War. The final official report gives the yield of winter wheat as 558,500,000 bush., and that of spring wheat as 358,500,000 bush. (*Broomhall's Corn Trade News*, 12th, 16th, 17th, and 28th December, 1918.)

Argentina.—According to the official estimate the wheat crop of 1918-19 will be about 23,500,000 qr (5,105,000 tons). The oats crop is estimated at 4,600,000 qr. (640,000 tons). (*Broomhall's Corn Trade News*, 9th January, 1919.)

Live Stock in the Netherlands.—According to the census taken in August, 1918, the number of horses in the Netherlands was 378,294 against 337,818 in September, 1917; cattle, 2,048,872, against 2,301,532 in March-April, 1917, and pigs, 600,133, against 1,185,438 in March-April, 1917. (*International Crop Report and Agricultural Statistics*, December, 1918.)

THE Crop Reporters of the Board, in reporting on the crops and agricultural conditions on the 1st January, refer to the wet weather that prevailed very generally during December as hindering field work more or less throughout the country. Of the area intended for wheat it is estimated that some three-fourths has already been sown. As compared with last year, the area already placed under wheat varies considerably; in the north and parts of the eastern counties, this work is much more backward, but in the midlands and west it is generally as forward as last year, or more so. On the whole, there was probably a little less actually in the ground. Sowing of winter oats and rye is also rather less, but the area of beans seems about equal to last year. The young crops are everywhere quite satisfactory, except on certain heavy and low-lying land.

Seeds are mostly reported to be a strong healthy plant in the eastern counties, but elsewhere they are more variable, promising crops being often interspersed with patchy fields.

Turnips and swedes are generally of satisfactory quality, though there are a few reports from the north-western districts to the effect that they are not always keeping well.

Ewes are generally healthy and in satisfactory condition; the earliest in Dorset are reported to be lambing well. Other live stock have maintained fair condition, considering the frequent rains. The mild weather has allowed of their being kept late on the pastures, which has helped to conserve the fodders, so that prospects of winter keep have somewhat improved during the month.

Labour is still in short supply, but a slight improvement may be noted, and several districts report that it has been sufficient for requirements. Owing to the lateness of the autumn, it is expected that the demand for labour to prepare the land for the green crops next spring may be rather greater than usual.

The following local summaries give further details regarding agricultural conditions in the different districts of England and Wales:—

Northumberland, Durham, Cumberland, and Westmorland.—Labour, especially skilled, is still deficient.

**Agricultural
Labour in
England and Wales
during December.**

Lancashire and Cheshire.—The supply of labour is still deficient, though there are signs of improvement.

Yorkshire.—Labour is still scarce, but the position has improved somewhat during the month.

Shropshire and Stafford.—The supply of labour is still short, but is gradually improving.

Derby, Nottingham, Leicester, and Rutland.—The supply is still short.

Lincoln and Norfolk.—Labour is still deficient, but there are signs of improvement.

Suffolk, Cambridge, and Huntingdon.—The supply of labour, though short in a few places, is generally sufficient to meet the requirements.

Bedford, Northampton, and Warwick.—The supply of labour, though deficient in a few districts, generally appears to have improved, and to be about sufficient to meet the requirements.

Buckingham, Oxford, and Berkshire.—Skilled labour is still deficient, but there is enough casual labour to keep work in hand.

Worcester, Hereford, and Gloucester.—The supply of labour is improving, but there is still a shortage of skilled men.

Cornwall, Devon, and Somerset.—The supply of labour is still short, but there are indications of improvement in some districts.

Dorset, Wiltshire, and Hampshire.—The supply of labour is still short, but there are indications of an improvement.

Surrey, Kent, and Sussex.—The supply of labour is still short, particularly as regards skilled men, but there are indications of improvement.

Essex, Hertford, and Middlesex.—The supply of labour is still short.

North Wales.—Conditions have improved, though there is still a lack of skilled hands.

Mid-Wales.—The supply of labour is short in most districts, but the shortage does not appear to be serious.

South Wales.—Though in a few places the supply is sufficient for this season of the year, in most districts there is a deficiency.

IMPORTANT NOTICE.

It is hoped to publish with the March issue of this *Journal* a Supplement dealing with the cultivation, composition and diseases of the potato, including a full report on the experiments in connection with Wart Disease, and the results of the spraying campaign conducted during the summer of 1918. The Supplement will be well illustrated. Copies will be obtainable at the price of 6*d.* per copy, post free, and in view of the difficulties relative to printing and paper it is desirable that orders should be sent at the earliest possible date.

THE JOURNAL OF THE BOARD OF AGRICULTURE

Vol. XXV. No. II.

FEBRUARY, 1919.

EDITORIAL NOTES.

It has lately become a trite saying that the United Kingdom has been too dependent on imported food, and that she must produce in future a far larger proportion of her essential supplies. The position we occupied before the War is emphasised by Sir Thomas Middleton in a novel manner in his Paper read before the Agricultural Club on 14th November last: he estimates (see p. 1264) that the home-grown food of the United Kingdom before the War would have kept the whole population in any one week only from 6 p.m. on Friday till 10 a.m. on Monday. In other words, we had become producers for the week-end. Germany's policy was to grow all her food supplies on her own soil—"under the protection of her guns"—while ours was to look to the world at large for the bulk of our supplies, and farm at home in such a way as to secure the highest profit irrespective of the quantity of essential foods produced.

Whereas each 100 acres of German farm land included (before the War) 21 acres of permanent grass, 11 acres of temporary grass, 46 acres of white straw crops and 10½ acres of potatoes, each similar English area included 58 acres of permanent grass, 11 acres of temporary grass, only 19½ acres of corn crops and only 1½ acres of potatoes. In consequence of their system, a large part of the farms being under arable cultivation, the Germans were able to feed from 70 to 75 persons for a year from the produce of each 100 acres, the British farmer only 45 to 50 persons. This result was not due to Germany's yields per acre being greater than the British yields, but solely to her active plough policy.

During the War, owing to the need for increasing our home-grown food supplies, accentuated by the enemy's submarine campaign, and taking into consideration the greatly increased

yield of human food per acre of tillage land compared with grass land, it was necessary to plough up grass land and grow corn, and to import meat. Having depended in the past too much on grass, growing insufficient winter food for stock, and relying too much on imported feeding stuffs, we are now suffering from shortage of winter keep for stock, more particularly as in the past year part of the root and temporary grass area was necessarily devoted to corn. Hence there was a glut of meat in the autumn and is likely to be a considerable shortage in the spring. In Sir Thomas Middleton's words—"We are reaping the consequences of using land for grazing that ought to be under tillage."

The plough policy cannot be legitimately criticised because in some cases crops on the newly-ploughed land have failed, since the crops have usually succeeded and "the oats and oat straw produced are worth much more to the farmer than the hay and grazing lost." "It was as obvious to the Food Production Department a year ago as to their critics to-day that there would be 'casualties' in breaking up grass land; but as it was essential that more tillage land must be secured these risks had to be faced."

The question of food production as a peace policy is considered by Sir Thomas Middleton from the point of view of the different classes of the population, and the need for State assistance for British agriculture from the standpoint of the tax-paying public. The conclusion is that the extension of the area under the plough is not only desirable, but essential to the country's welfare, to secure increased production of necessary crops for the support of the maximum number of the population, and that the public will require it in the interest of the Nation, and are likely to consent to some such guarantee as that provided for corn-growers by the Corn Production Act.

A REVISED Scale of Compensation, recently issued by the Board, for guidance in the enfranchisement of copyholds

Scale of
Compensation for
Enfranchisement of
Copyholds.

of inheritance, appears on p. 1383. This scale is in substitution for that originally issued in 1888 by the Land Commissioners for England who were absorbed in the Board of Agriculture when it was con-

stituted in 1889.

The effect of the revision is to reduce considerably the compensation payable in enfranchisement in respect of fines, reliefs, heriots and also in respect of quitrents and other

annual manorial payments. Although intended primarily for guidance in compulsory enfranchisement under the Copyhold Act, 1894, it is understood that the Scale is used largely in enfranchisements at Common Law. It is also in practice used for valuations of copyhold lands for various purposes other than enfranchisement.

* * * * *

In accordance with their powers under the Corn Production Act, the Agricultural Wages Board in September last fixed the

**Value of Cottages as
Part Payment of
Agricultural Wages.**

maximum value at which the provision to an agricultural worker by his employer of a cottage free from defects of accommodation, or sanitation, or water supply, and not in want of repair, might be reckoned as part payment of minimum rates of wages in lieu of payment in cash, as 3s. per week. Under the Order of the Agricultural Wages Board, however, District Wages Committees were empowered to determine the maximum value in their areas as less than this sum. The only District Committees which have considered it necessary to make any determination in this respect are those for Buckinghamshire, Herefordshire, Northamptonshire and Somerset. The Wages Board have approved the determinations for these counties, and the maximum value of cottages in the areas in question has been fixed as follows :—

Herefordshire and Northamptonshire (including the Soke of Peterborough)—2s. 6d. per week.

North Buckinghamshire (Rural Districts of Newport Pagnell, Stratford, and Wolverton, Buckingham and Winslow)—2s. per week.

Mid-Buckinghamshire (Rural Districts of Wing, Aylesbury, and Long Crendon)—2s. 6d. per week.

Somerset (Rural Districts of Williton, Dulverton, Wellington, Long Ashton, Axbridge, Langport, Yeovil, Keynsham, Shepton Mallet, Wells, Wincanton and Frome)—2s. 6d. per week.

In the remaining parts of Buckinghamshire and Somerset, and in all other counties of England and Wales, the maximum value for the purpose in question continues to be 3s.

In this connection it should be pointed out that if the worker considers that a cottage for the provision of which a deduction is made from his wages is defective in accommodation, sanitation, or water supply, or is in need of repair, he may ask the District Wages Committee for his area to fix the sum which may be deducted at less than the maximum sums mentioned above

FOOD PRODUCTION IN WAR AND PEACE.

THE following Paper was read by Sir Thomas Middleton, K.B.E., C.B., at a meeting of the Agricultural Club on Thursday, 14th November, 1918 :—

FOOD PRODUCTION AS A WAR POLICY.

Food production is not the same thing as agriculture ; thus the policy underlying the food-production movement may not correspond with the policy that should govern ordinary farming activities as carried on before the War.

If I may adapt language much used in another connection, it can be said that before the War the attention of agriculturists was concentrated on an effort to survive. They had come through a 40-years' struggle for existence, and it is not surprising that the farmer's one test of successful farming was the bank book, and that the landlord's golden rule of good husbandry which overshadowed the binding rules of the Victorian era was " Be punctual on rent day and pay in full." That type of farming was best which produced a sufficient return on the capital invested with the least risk and trouble to the farmer himself and to his landlord. The British people looked to the world for its food and to the Navy for the certainty of its supply (and be it remarked, in spite of all that has happened, there was foundation for the confidence). The land of Britain itself was, as it were, but the home farm, a convenient source of milk and vegetables, of good meat for week-ends and holidays, but otherwise of no great account as a contributor to the stability of the estate. My week-end metaphor is more than a figure of speech. I estimate that the food grown in the United Kingdom before the War would have kept the whole population from 6 p.m. on Friday till 10.0 a.m. on Monday.

Comparison of British and German Methods.—Our principal enemy in this War took quite a different view of the functions of the agriculturist. There was, as in this country, much controversy as to the merits of rival policies. The policy which prevailed was thus stated by German economists :—Germany must " keep under the protection of her guns the ground upon which her corn grows and her cattle graze." Translated into practice this meant that before the War, about nine-tenths of the food of Germany was home produced, and that during the War, as the production of her own soils has inevitably fallen

off, one guiding principle in her strategy has been to occupy the most productive territory within reach.

As an illustration of the effects on a national scale of an agricultural and a food-production policy, we may, therefore, contrast the systems of Britain and Germany. I may do so conveniently by referring to some figures from a pamphlet I wrote on German Agriculture in 1916.

On each 100 acres of cultivated land* before the War—

- (1) The British farmer fed from 45 to 50 persons, the German farmer fed from 70 to 75 persons.†
- (2) The British farmer grew 15 tons of corn, the German farmer grew 33 tons.
- (3) The British farmer grew 11 tons of potatoes, the German farmer grew 55 tons.
- (4) The British farmer produced 4 tons of meat, the German farmer produced $4\frac{1}{4}$ tons.
- (5) The British farmer produced $17\frac{1}{2}$ tons of milk, the German farmer produced 28 tons.
- (6) The British farmer produced a negligible quantity of sugar, the German farmer produced $2\frac{3}{4}$ tons.

The reason why Germany produced so much more food was not that the yield per acre of her crops was greater—they were in most cases less—but that while most of the land of Britain is under grass, most of the land of Germany is under the plough.

The figures below (see the table over-page) contrast the cropping of the cultivated land of England and Wales and of Germany before the War.

What were the outstanding features of the English and German farms? On each 100 acres of land it will be seen that whereas the Englishman had 58 acres, the German had only 21 acres of permanent grass; adding temporary to permanent grass the Englishman had 69 against the German's 32 acres. On the other hand, when we come to white straw crops, the Englishman had $19\frac{1}{2}$ acres of corn on his 100-acre farm, the German 46, and while the Englishman grew $1\frac{1}{2}$ acres of potatoes the German grew $10\frac{1}{2}$. But the real significance of these figures cannot be appreciated until we answer this further question—

* Cultivated land includes arable and grass land, but excludes the "Mountain and Heath Land used for Grazing" of Britain and the corresponding "Geringere Weiden und Hütungen" (poor pastures) of Germany.

† These figures are based on the estimate that, of the total "energy value" of food consumed, Great Britain imports on the average about 60 per cent., and that Germany imports 10 per cent.

From information which has become available since the original Paper was published, I now estimate that the British farmer fed from 40 to 45 persons before the War.

What is the value of the crops grown? Now here we must distinguish between the money value and the food value. Our customary method is to value in terms of pounds, shillings and pence the yield per acre of land, but we cannot live upon

*Cropping of Cultivated Land in England and Wales
and in Germany.*

cash, and for nations compelled to feed themselves, as the Germans have been for the past four years and as we might have been if Germany had only built a larger fleet of submarines before she declared war, the value must be assessed in some other way. Let us inquire, therefore, how many persons 100 acres of land will feed for a year if put under different crops.

Relative Values of Pasture and Arable Cultivation.—First, as regards grass. We have in this country grass of varying quality, from the hill pasture producing 2 or 3 lb. of mutton per annum to the rich grazing pasture on which a bullock may put on 3-4 cwt. of live-weight per acre in the season. If we take very poor lowland pastures worth from 2s. 6d. to 5s. per acre for grazing, it will be found that they yield about 20 lb. of lean meat per annum; a medium pasture, rented at from 15s. to 20s. according to the district, may be expected to produce about 100 lb. of meat, while a first-rate fattening pasture, rented at from 30s. to 40s., may produce as much as 200 lb. per acre per annum. If we take the produce of 100 acres of land

of each description and assume that the meat produced is used skilfully in combination with other foods, and if by this method we calculate the total number of persons who could be supported on the produce of 100 acres for one year, we get the following figures :—

From the poor pasture	2—3 persons.
„ medium pasture	14—16 „
„ rich pasture	25—40 „

Now how do these figures compare with the produce of tillage land? Let us assume that we have 100 acres growing an average crop of wheat, that the tailings and damaged grain are used in cattle-feeding, and that the balance of the crop after providing seed amounts to about 29 bush. per acre. The produce of 100 acres of this wheat, if milled to 80 per cent. would yield food for 230 persons for a year, and if the milling were reduced to about the pre-war standard it would provide food for 200.

Making similar estimates for average crops of barley and oats, we should find that they provide food for from 160-180 persons per 100 acres.

Potatoes, which, by themselves, would be quite an unsuitable food, but which, in combination with a limited amount of grain and meat, are quite capable of maintaining a population in perfect health, are even more valuable from the standpoint of maintenance of a large population than the cereals. An ordinary 6-ton crop, after allowing 15 cwt. for seed and 10 per cent. for waste, should provide enough to feed 400 persons per 100 acres of land. We may next compare with these figures the value, as human food, of such crops as mangolds and meadow hay. These cannot be used direct but must be employed in producing meat or milk. Assuming that they are used in meat production, a 20-ton mangold crop would produce food for 40 persons per 100 acres and a 30-cwt. crop of meadow hay would similarly provide for 14 persons. It will thus be seen that there is a wide range in value between our different farm crops when value is estimated in terms of production of human food.

It is not practicable, or at least under ordinary farming conditions it would not be practicable, to grow cereals and potatoes continuously. The crops of our tillage land are arranged in rotations which vary from district to district. I have estimated that if we averaged the rotations practised in the United Kingdom before the War and used the tillage crops partly for human food, partly for stock-feeding, as was

then our custom, the produce of the ploughed land of the country maintained about 84 persons per 100 acres. Similarly, I have estimated that before the War the grass land of the United Kingdom, which was partly used for milk production, partly for meat production, partly for other purposes, such as the maintenance of horses and the growing of hay, was providing food for about 20 persons per 100 acres per annum. In time of war, therefore, when the production of human food is the prime object of the nation, there can be no controversy as to the relative values of tillage and grass land.

Production of Meat as Compared with Wheat.—But in time of war it is not enough to consider the relative number of men who can be fed on a given area of land. We must also have regard to the shipping required for provisions.

At first sight it would seem that it would be better for us to import wheat than meat, for roughly 2 tons of wheat can be shipped for 1 ton of meat; the first occupies about 50 cubic ft. of shipping space and the second about 100 cubic ft. But we must not stop short with this simple calculation. Clearly, when attempting to estimate whether a nation short of tonnage should attempt to produce wheat or meat we must think in terms of acres as well as in terms of ships.

Let us take a very simple case. Suppose that the population of an island wholly under grass, after providing for their milk supply had 80,000 acres of grazing left for meat production, and that the land was of a quality that produced 1 cwt. of meat per acre per annum, then the total supply of meat would be 4,000 tons. To hold this amount of meat a 10,000-ton steamer would be required. Further, assume that each year the island has to charter a 10,000-ton steamer to bring in its wheat, a ship of this size would carry 8,000 tons of wheat, roughly the quantity that could be grown on 10,000 acres of land. It is clear, therefore, that if tonnage were scarce it would be possible for the island to effect a very large saving by substituting wheat for meat. If it were practicable to break up 10,000 acres and to produce average crops of wheat within a year, seven-eighths of the tonnage could be released for other purposes.

This tonnage consideration was one of the main reasons for breaking up grass land in 1918. It was known that ships would be very scarce, and it was obviously desirable to substitute for grass some crop which would reduce the tonnage demands of the country.

The respective effects of grazing and tillage on the permanent demand for tonnage cannot, of course, be determined by the

simple process of estimating how much wheat and how much meat given areas would produce. Wheat is not grown continuously even in time of war, and assuming the islanders in our illustration wished to produce wheat for a considerable period of time they must plough at least 20,000 acres of land, and most probably provide shipping space for implements and manures; but it would be safe to conclude that if suitable land for wheat-growing were available, the results of substituting tillage for grazing would be to release in time of need 4 ships out of every 5 required for carrying wheat.

Feeding of Live Stock.—There is a further aspect of grazing and tillage farming which is of special interest and importance at the present time, viz., the effects of grazing and tillage on live stock.

There is no branch of British farming so important to the farmer himself as the breeding and rearing of live stock.

Even on arable farms cattle and sheep breeding and feeding are often more profitable than the cultivation of any tillage crop, and the main interest of many of our arable farmers is centred upon live stock. No arable farmer will dispute the fact that grass is the natural food of stock and that stock raising on grass is usually not only an easier and safer business for the farmer, but better for animals themselves than stock raising on tillage crops. Thus in most parts of the country, even where the soil is well suited for tillage, every farm has 40 to 50 per cent. of the land in grass (the chief exceptions are on the chalk). The result is that we do not grow enough winter food for our live stock.

Before the War we were using over 4,000,000 tons of feeding-stuffs in the production of meat; by far the greater part of these feeding-stuffs consisted of the by-products of the flour or oil mill, but a very substantial amount of grain was imported for meat production. The use of the by-products of home industries in stock-feeding is wholly desirable; but the unfortunate effect of their abundance before the War was to lead farmers to depend too largely on imported feeding-stuffs instead of on the products of their own land. We are now suffering the consequences. We have an abundance of summer keep to maintain our flocks and herds and we have roots or straw for winter use, but we are cut off from the feeding-stuffs so necessary for winter fattening, and our live-stock industry may suffer severely before supplies are again available.

Not only so, but whereas we have plenty of cattle and sheep in the country to supply moderate rations of meat, there

is a glut of meat at the end of the grass season and there will be a shortage in the spring. We are reaping the consequences of using land for grazing that ought to be under tillage.

In this particular year (1918), because of the threatening position of cereals in 1917, we have even sacrificed a part of the limited area of arable land devoted to keeping stock. Our root crops and much of our temporary grass have given place to corn so that, partly from the reduced area and partly from an unfavourable season, supplies of these natural winter foods of our live stock are very limited in many counties.

Some critics of the Food Production Movement ascribe the present difficult position of live stock to the ploughing out of grass last season. Where the crops on newly-ploughed land have succeeded, as they usually have, the oats and oat straw together are worth much more to the farmer than the hay or grazing lost ; where crops have failed, there is, of-course, a total loss ; but we cannot legitimately criticise the policy of ploughing up grass land on this account. The real fact was that war found us with a system of farming well enough adapted to the conditions of 1913, but wholly unsuitable for the period of struggle on which we embarked in 1914. We continued our system for two years trusting to luck to end the War and to the Admiralty to check submarines. When, at the end of 1916, it was realised that the War would go on, that the American cereal crop was poor, and that the submarine was increasing its toll on our ships, we decided to change our methods. It was as obvious to the Food Production Department a year ago as to their critics to-day that there would be " casualties " in breaking up grass land ; but as it was essential that more tillage land must be secured these risks had to be faced.

So long as war conditions continued it was necessary to go on increasing our tillage land as rapidly as the labour at disposal enabled us to make the change. In the autumn of 1918 our own food supply was in a much less precarious state than at the beginning of this year ; but had the Armistice not been signed last Monday our herds and flocks would have been in even a worse position during the next six months than they were in before America entered the War ; for whereas we could represent to the United States that our own bread was more essential than their soldiers, we could not claim that it would be in the interest of the Allied Nations that American troops should be held up and the War prolonged in order that we might avoid killing off our sheep and cattle.

FOOD PRODUCTION AS A PEACE POLICY.

Considerations likely to affect future Farming Methods. — But the combatant nations have had their fill of war, and now what is the agricultural policy of Britain to be? Is it to be in favour of a cheap food supply regardless of security, or a safe food supply regardless of cost? Are we to continue British farming as a "week-end" adventure, or are over 46,000,000 acres to be required to do more for our 46,000,000 people? Shall we adopt the system of farming that with least risk is likely to be the most profitable to the small percentage of our population now living on the returns from the land; or shall we endeavour to exploit the resources of our soils for the purpose of providing employment for more of our people?

He would be a bold man who at this stage would attempt to prophesy.

Let us merely catalogue the voices that will shout loudly in the Great Palaver that will follow the signature of the Peace Treaty :—

1. There is our own. Agriculturists will undoubtedly make themselves heard; theirs will not be the loudest shout, and their cries, unless they are backed up by other sections of the nation, will not carry far, for relatively they are few in number. It follows that if the agriculturists' cry is to gain attention it must be as attractive to others as to themselves. It must be reasoned and reasonable, it must admit that agriculturists are in a minority and that their own demands must be proved to be advantageous to their fellows.

2. There will be the food-consumers' shout—the greatest of all, for all of us are consumers; but to the wealthier classes the cost of food is a secondary affair, and the consumer's shout will be a crescendo growing louder as the earnings of the consumer fall; loudest of all, therefore, from those who represent the poorest among us.

The satisfying of this cry will raise questions of extraordinary difficulty, and the agriculturist will be well advised to give it not only close but sympathetic consideration. He should, indeed, start with the study of his own programme from the standpoint of the poorest of the consumers.

3. 4. Next there will be the demands of the Free Traders and Tariff Reformers. I am on dangerous ground in attempting to express an opinion on sacrosanct subjects; but it appears to me that Free Traders are generally right

in principle and often wrong in practice ; while Tariff Reformers are generally wrong in principle, but often right in practice. Free Trade is a perfect principle for a perfect world ; but, inasmuch as the nations of the world are not yet perfect, and as the traders of these nations are not, in matters affecting public weal, superior in their honesty and disinterested devotion to the mass of the inhabitants whom they represent, Free Trade is not yet fit for acceptance as a World Trade Principle. At the same time, even those who have liked it least, the agriculturists of Britain, should admit that it served Britain magnificently in the Victorian era ; and those of our industrialists who profited by it most should equally be prepared to admit that Protection served the policy of the German nation magnificently in the 20 years before the War. Let us, therefore, reserve our views on Free Trade and Protection as questions of principle, so that the special needs of particular industries may be approached without economic bias when their development is under consideration.

5. There will be a party who will claim that the "Peace of Versailles" will be the last Peace Treaty, that wars have ceased, and that henceforward the nations of the world will have no need for defence. A League of Nations would greatly lessen the danger of wars ; but I hope you will not think me cynical if I express the belief that any great nation which neglects the means of defence will soon cease to be great in the world's councils. Religion and education have failed to prevent war. Is there any prospect that the rulers of mankind in the Twenty-first Century will be better men than were, say, the rulers of the Nineteenth Century ? Who among us 25 years ago would have believed it possible that another Attila would spring up ? The Hohenzollerns have gone, but even if the most ample safeguards are taken to prevent the future emergence of a Hohenzollern, who is there to guarantee the permanent suppression of Lenins and Trotskys ? Meantime be it noted that Hindenburg is recrossing the Rhine "with head erect."

6. A more popular view, if I mistake not, will be that of the representatives of the Blue Water School. Britain must be secure, Britain must be defended. Her shield is her Navy, her future, like her past, will be on the waters. The magnificent work of our Navy in the

present War, the no less magnificent work of our merchant service, compel our gratitude ; may this not compel our reason ?

What of the submarine of the future ? Can we be certain that as the Navy has suppressed it, and as our merchantmen have defied it during the past four years, they would do so again ? I know no more about submarines or about the devices for their destruction than do, say, 9 out of every 10 voters who will elect the first peace Parliament—in other words nothing at all beyond what I can infer from the history of the past four years—but this is how the position appeals to me : Naval construction will concentrate on the improvement of the submarine and on the development of devices for destroying it. In both there are certain to be improvements in the next generation, as there have been in the battleship, the locomotive, and the telegraph system of the past century. It is possible that the means of destruction will so far outpace the improvements of the submarine that the latter will disappear ; but to the outsider it would seem that the odds are in favour of the submarine. Admiral Sims told us the other day that Germany has recently only been able to keep 8 to 9 submarines on the Atlantic at one time. The German newspapers have, within the past few weeks, bitterly reproached their naval authorities for neglecting submarine building, and have stated that at times three only were available for use on the western side of Britain.

The submarine is a small vessel, and I should suppose that a number could be made at the cost of one Dreadnought. Is it not likely that in any future naval war many will be available at the outset, and even if there are no Emdens or Moewes on the high seas a very heavy toll of shipping would be taken before the seas could be cleared.

The huge strength of the Allied fleets, the convoy system, and the very small number of effective submarines, have enabled us to struggle through this War ; but unless submarine building is debarred by peace treaties and enforced by a group of powerful nations, it seems to me that Britain could only neglect the submarine menace at the risk of abandoning her position as a Great Power.

I have said enough to indicate the types of question that will occupy public attention so soon as the urgent problems of war cease to monopolise the thoughts of the public. Let us, therefore, return to a consideration of our own affair—the position of agriculture and the policy of food production as

distinguished from the pre-war policy which guided the methods of landowners and farmers.

Assistance to British Agriculture.—What is likely to happen? When the period covered by the Corn Production Act ends in 1922, will agriculture be treated as it was before the War or will the principle of the Corn Production Act be continued?

I think you will agree with me that in view of the great change that has been made in our electorate and the numerous issues that will be raised in our first Peace Parliament, a mere statement of opinion would not be very fruitful. Instead, let us discuss the effects of alternative policies. And first, the effects of a return to the policy of the past.

During the War we have gained something. There is no doubt that our farmers are more alert than before, that they are more ready to adapt their methods to new conditions, and that many of them will continue new practices begun during the War. We have, moreover, a much greater area under the plough. Tillage crops, other than temporary grass, now occupy 15½ million acres in the United Kingdom as compared with just under 13 million acres before the War. For a time, too, prices of corn are likely to be considerably higher than before the War. For what length of time after 1922 these higher prices may continue will depend chiefly on the world's harvests. It is indeed possible that for a long time to come prices will not fall to the 1900-1914 level, since the value of money may take a long time to recover; but when measured in terms of the value of other commodities, it is probable that at no very distant time, say within 10 years, we would be likely to have very low corn values as the result of good world harvests.

While it is improbable that the value of the farmer's products would long remain above the pre-war values, it is certain that his expenses will increase, notably the price of labour. Wages have nearly doubled, and while it may be admitted that this will not double the cost of labour, I think it is certain that the cost of labour in the future will be much higher than before the War.

Even with higher wages the labourer's position is not satisfactory—the need for better cottages is pressing; these must be provided in numbers if the land is to be tilled. Will the profits of agriculture bear the burden? Even if the labourer's wage stands at the present level could he afford to pay an economic rent? For cottages built within the next 5 years I should suppose that the economic rent would be nearer 6s. than 3s. per week.

What then would be the farmer's position if we go back to our old agricultural policy?

Some years before the War I asked a prominent northern farmer how things were going with him. "Farming was never so exciting" was his reply. "How so?" said I, knowing that he farmed in a secluded and peaceful valley. "Trying to make the rent" was the quick reply; and I daresay that if we look back on the past 20 years or so we will agree that, on my friend's view of the case, farming was an exciting business for most tenants. The question that arises here is—Can farmers as a class afford to farm in any other way than they did in the pre-war period? Must their attention be concentrated narrowly on rent day, or can they afford to alter their methods in the direction of producing more food from the soil? While I believe that the end of the War will find the capital at the disposal of most farmers much increased, my personal view is that if the pre-war policy of leaving the farmer to face world competition is continued, he will soon return to the exciting pastime of rent-finding.

And the landowner and manager of estates. What is their problem? I suspect that before the War many estate agents had quite as exciting a time in finding the wherewithal to meet death duties and public or private burdens on land as farmers had in finding rent, and the War has certainly not improved their position.

The conditions during this War have been fundamentally different in their bearing on land from those that ruled during the wars of the Eighteenth and early Nineteenth Centuries. Then wages were low and labourers suffered acutely; rents were very high, and though after Waterloo corn prices were relatively greater than at any time during the present War farmers lost money and many became bankrupt. Nominally, landlords grew rich on the great rents they received. In fact, most of them did not grow rich, the money saved was invested in permanent improvements on their estates, and the capital thus sunk by them resulted in a sufficient food supply being provided during many years for the rapidly-growing industrial population of this country.

Harsh things were done by some landlords in connection especially with the enclosure of land; harsh things have been said of all of them since; but the care which landowners gave to the improvement of their estates, and the extent to which they invested the proceeds of land in the improvement of the soil between 1760 and 1820, made possible, not only the

successful prosecution of our Napoleonic Wars, but the growth and prosperity of industrial England.

During the present War, while rents have not gone up, public burdens have greatly increased and interest on mortgages has risen sharply. Landowners will be in a very different financial position from that in which they found themselves a century ago. Occupying owners have, perhaps, increased their capital; but the total volume of this increase is insignificant, and unless there is a great transference of land to men who have made profits in other industries, it is difficult to see where the private capital necessary for the improvement of land is to come from.

On the other hand it is clear that the condition of much of our land after the War will demand a substantial investment of capital in buildings, drainage, liming, fencing and those other permanent improvements which the owner is expected to provide.

I would like to sum up the foregoing discussion by predicting that the lessons which the farmer has learned from the War and the money he has saved would, in themselves, result in a permanent increase in the tillage area of the country; but I am forced to the contrary conclusion. If we adopt the pre-war policy; if the nation tells the farmer that his corn crops are immaterial to its welfare and that it will look to its ships, not to its ploughs, to provide a secure bread supply, the land recently ploughed up will rapidly revert to grass and the conversion of old arable land to pasture will proceed even more rapidly after 1922 than it did in the period before the War.

Now, as to the prospects of an alternative policy. Is it likely that the taxpayers of Britain, burdened as they will be for many years to come, will consent to continue any such guarantee as that provided for corn-growers by the Corn Production Act? My personal opinion for what it is worth is that they will, and I am glad that in support of this view I can cite statements of more value than my own opinion.

The Prime Minister, speaking at Manchester on 12th September, made use of these phrases, "Comfort is the surest preventive of anarchy, but comfort involves plenty. You can ensure plenty by ensuring the best conditions for production. . . . We have been dependent on others, not because Great Britain cannot produce food, but because we never realised the importance of home production. . . . It is in the highest interests of the community that the land in this country should be cultivated to its fullest capacity. . . . The cultivation of the land is the basis of national strength and prosperity."

The views expressed by Mr. Lloyd George are likely to prevail widely, after the War, among the industrial classes of Britain, whose experience of a bare breakfast-table in the past two years has discounted the benefits of the free breakfast-table of which we heard so much in the past. Whether this first conclusion from war experience is strengthened, or passes away, will depend not a little on the action of agriculturists themselves.

At best this new belief in the value of home agriculture must be but a tender plant for a generation; during this period every farmer who adopts a selfish and narrow policy, who refuses to make the most of the land at his disposal, who neglects to bring the "comfort" to his town neighbours which the Prime Minister promises them, will be a traitor to the welfare of British farming. The townman asks for good, wholesome farm produce and plenty of it; it is our task to see that he gets it.

Settlement on the Land.—But there is a second consideration that will tell powerfully in favour of tillage farming. There has been a great accession to the ranks of the workers of Britain during the War, chiefly through the influx of women. The men will come back; the women, or many of them, will not go. The demand for profitable employment will be great. Our industries will not soon recover from the shock of war. Some of them may not regain their former size in our time, if ever. Take the luxury trades, which thrived while nations were rich; what is to become of them while Europe is paying its debts? After the War, money will not circulate as it has done in the past, and our expenditure will be mainly on commodities which are essential to us.

Now what is Britain going to do with these superfluous workers? "Send them to her colonies" is perhaps the solution that most of us would suggest, for in the colonies there is room. But could we, as a nation, order our young men who have fought for Britain, and our young women who have toiled for Britain, to leave the land of their fathers against their wishes and commit the care of the land itself to herdsmen and shepherds? This is sentiment, you will say, not business. I am not prepared to agree; agriculture is the most essential of our industries; land, to borrow the language of the economist, is a prime instrument of production, and, in the circumstances in which the able-bodied men and women of Britain are likely soon to find themselves, land must be put to its fullest uses.

The land of Britain is well suited for cultivation; in most parts the climate is as favourable for mixed farming as that

in any European country. The weather can be bad, we know to our cost, but we need not take fright because of our recent experiences. Ninety years ago, after the first effects of the Napoleonic wars had disappeared, although farmers were without artificial manures, without pipe drainage, and almost without machinery, Britain fed a larger population than to-day. If the advantages which we enjoy in the early Twentieth Century were yoked to the energy of our forefathers we might be almost or quite self-supporting in spite of our climate. It is not the case that Britain cannot grow corn, and while it may be admitted that many parts of Britain produce very fine pasture, we must guard against the assumption, too readily made by agriculturists, that land which produces fine pasture should not be tilled.

Agriculture as a National Asset.—There is a third consideration that will greatly affect our national agricultural policy after the War. It has been estimated that before the War we were spending some £250,000,000 per annum in the purchase of corn and other foodstuffs of a kind that could be grown within the country. Before the War this may have been very good business from a trader's standpoint, for we paid other countries by sending to them £250,000,000 worth of the coal, machinery, cotton goods, etc., produced in this country. After the War the position will have altered. We have incurred huge debts, and our coal and the goods which we manufacture must be exported to pay these debts. Every pound's worth of food that we can grow for ourselves will make the paying of our debts easier. If there is enough employment in other necessary industries it might possibly pay us better, as a matter of trade, to employ our workers in these industries and to export the products of their work to pay for food. But for reasons which I have already indicated, employment on necessary industries may be hard to find. If this is so, and the labour can be employed in agriculture, even though tillage may prove less remunerative to the farmer than grass farming, the nation would be a gainer by tillage; for while the farmer reckons in net values, the nation reckons in gross.

Adopting pre-war values, the following example may be given: The gross value of the produce of 100 acres of medium quality grass set aside for grazing cattle would be £300 to £400 per annum, but the corn crops, roots and temporary grass from 100 acres of medium land worked on a 4-course rotation would be worth from £700 to £800. It is obvious that if an additional £400 worth of food can be grown at home without causing

other industries to suffer, the nation has £400 more with which to pay its foreign debts.

The foregoing consideration seem to me to justify the Prime Minister's Manchester programme, and I expect that after the War he will gain many adherents from urban electorates to support the propositions that "It is in the highest interests of the community that the land in the country should be cultivated to the fullest capacity. . . . In the future we must see that its representatives have the necessary attention and encouragement."

I do not wish to read into the words of Mr. Lloyd George more than they were intended to express; but when he spoke of "attention and encouragement" he no doubt had the provisions of the Corn Production Act in view. These two things will go together. The farmer would like "encouragement," but could very well, he thinks, do without "attention." He is sick of the sight of "officials," and even his own neighbours and friends, now that they are enrolled in Executive Committees and what not, are less welcome on his premises than they were before!

But, if I am right in my surmise that we shall not return to our pre-war agricultural policy, this pair, in the farmer's view this awkward pair, "attention and encouragement," have come to stay, and we had better get used to seeing them go in double harness as quickly as we can.

The pair will speed the plough as certainly as any pair of powerful Shires or smart-stepping Clydesdales; for it needs no prophet to foretell that, if the British public once give their attention to the products of the land they will insist on an increase in the quantity of food; there will be but little sympathy for the man who comes forward with the excuse "Knowing that thou art a hard master my one talent lies buried beneath the grass"; the grass and the talent will both come up and will pass to the man prepared to multiply production ten-fold.

This is my forecast of the fate of our Food Production Policy and of the prospects for British Farmers after the War.

THE TEMPORARY LEY.

R. G. STAPLEDON, M.B.E., M.A.,

*Adviser in Agricultural Botany, University College of Wales, Aberystwyth ;
and Director of the Official Seed Testing Station at the Food
Production Department.*

INTRODUCTION.—In view of the fact that some 1,527,000 acres of permanent grass have been broken up for the production of cereals and other essential foodstuffs during the period of the War, the question of the best means of bringing much of this land into rotation husbandry will become an urgent one. An important aspect of this problem will be the position that the temporary ley should take in the rotation. It will be generally admitted that in many parts of the country the soil and climatic conditions are not suitable for a rotation based on the one-year ley, and that a longer period under grass is desirable. This, of course, applies in particular to regions of high rainfall and hilly districts such as occur in the West and North of England, and in Wales. It is the more important that attention should be given to the problems connected with the formation of good temporary grass when it is remembered that after the Napoleonic and Crimean wars much of the land then brought under the plough to meet the Nation's needs was allowed to tumble down to grass without any forethought, and with no adequate seeding, and was subsequently permitted to lapse wholly from cultivation.

It is proposed in this article to deal with one aspect of the temporary ley only, namely, the selection of an adequate seeds mixture, and it will be assumed that the three- to four-year ley will enter into the after-the-war rotation in certain districts. It should be realised that a temporary ley will have failed in its purpose, and will not have fully justified its place in the rotation unless it has

1. Established itself rapidly.
2. Maintained a uniform productivity over the whole period of its duration.
3. Given rise to a weedless sward.
4. Left abundant leguminous residues to be ploughed in for the benefit of the subsequent arable crops in the rotation.
5. Given in the aggregate as much keep as, or more than, would the same field over the same period had it been left in permanent grass.

The selection of a good seeds mixture will not of itself guarantee success in each of the above directions, but the seeds mixture should be regarded as the foundation upon which to build, for, given a wise selection of plants, proper manurial treatment and reasonable management should enable these plants to establish themselves rapidly and to attain to maximum luxuriance. The selection of a seeds mixture would seem, however, to involve much more than is generally supposed; it does not entail merely the choice of the seeds of species that may be expected to succeed under the various conditions of soil and climate; it is probably necessary also to consider (a) the question of the variety or sub-species of the selected plants, and the country or district of origin of the seed; and (b) the relation of the sown species to those indigenous herbage plants that will always colonise on artificial grass land to a greater or less extent.

It will be necessary for the purpose of this article to give the results of investigations carried out over a period of five years in Wales, and of an inquiry undertaken on behalf of the Food Production Department in the summer of 1917. The following counties were then visited:—Devon, Cornwall, Dorset, Wiltshire, Herefordshire, Staffordshire, Leicestershire, Lincolnshire, Derbyshire, Lancashire and East Suffolk.*

Twelve extensive series of plot trials (four $\frac{1}{2}$ -acre plots at each centre) were put down in Central Wales in the spring of 1915†. It was intended to make an exhaustive botanical analysis of these each season for four years. It was not, however, possible to do this after the first year, owing to the writer being called away for special work in connection with the War. These and other plots were, however, visited during 1917, and rough estimates of the herbage were made by a modification of the methods generally used in exact grass land investigations.‡

* Thanks are due to the agricultural organisers of the above counties,† to the late Mr. Leighton, of Newcastle-under-Lyne, and to Mr. H. H. Dunn of Bournemouth and Salisbury, for valuable help in connection with the inquiry.

† These trials were arranged by the writer in his capacity of Adviser in Agricultural Botany at Aberystwyth, and were under the supervision of the agricultural organisers for Cardigan, Merioneth, Montgomery, Carmarthen, Pembroke, Radnor and Brecon. The mixtures in lb. per acre are given in "Grass Land and Ploughland," p. 35, Supplement No. 17 to this *Journal*, May, 1917.

‡ See the *Journal of Agricultural Science*, Pasture Problems.

(a) Drought Resistance, Vol. V., Part 2, March, 1913.

(b) The Response of Individual Species under Manures, Vol. VI., Part 4, November, 1914.

(c) Indigenous Plants in relation to Habitat and Sown Species, Vol. VIII., Part 1, September, 1916.

The method employed consisted in traversing the plots and taking readings with a mesh, but, instead of counting the individual plants, obtaining comparisons by working on a system of marks. This plan was also adopted when visiting the several counties in 1917. It cannot be claimed that data collected on the lines indicated are as reliable as those obtained by the more exact methods previously used. It is, however, felt that the figures may be taken as strictly comparative, and therefore sufficiently accurate for the immediate purpose of estimating the relative success of the different sown and unsown species under various conditions.

It will be convenient to consider the chief herbage plants separately, and in connection with each briefly to review the data available. The conclusions to be drawn will be summarised at the end of the article, *and a case will be made for an extension of grass and clover seed production in this country.*

THE LECUMINOUS HERBS.

Red Clover.—Red Clover is usually the foundation of ordinary one-year rotation leys, and is almost invariably included in mixtures for 2 to 4 years; when employed in the formation of these longer leys it is most desirable to use a strain of Red Clover that will "hold" into the second, and if possible, into the third year. Very little accurate information has in the past been collected as to the degree of persistence of the various commercial strains of Red Clover. The following data may, however, be cited:—

Central Wales.—The Red Clover in the mixtures on the four plots (previously referred to) was as follows:—

- Plot 1.—3 lb. Broad-leaved Red Clover per acre.
- " 2.—3 " Perennial Red Clover per acre.
- " 3.—3 " Late-flowering Red Clover per acre.
- " 4.—4 " Mixed Red Clovers per acre.

The results (in the second year) were as follows: At three of the centres there was no trace of Red Clover on the Broad Red Clover Plot. At five of the centres there was no trace of Red Clover on the Perennial Red Clover Plot, and at only one centre (at which the Red Clover had failed on all the Plots) was there no trace of Red Clover on the Late-flowering Red Clover Plot. At the eleven centres where the clovers had taken well the Late-flowering Red Clover was in every case more abundant on the plots than was the Broad Red or Perennial Red Clover. The average of all the plots, moreover, showed that Late-flowering Red Clover had contributed more than ten times as many plants

per acre (in the second year) than either the Broad Red Clover or the Perennial Red Clover. At three of the centres there was very nearly as much Red Clover on the Late-flowering Red Clover Plot in the second year as in the first. Observations made in the winter of 1916 on plots put down in the spring of that year* have shown that Chilian Red Clover comes rapidly into luxuriance during the first autumn after sowing and tends to flower more freely at this period than other clovers; at two centres it was injured more by frost, and at one of these (at 1,000 ft.) it had suffered much greater injury during the winter than had the clover on plots sown with seed harvested on the Cotswolds, in Dorset and in Montgomery. Observations on a large number of fields, in connection with advisory work on seeds mixtures in Central Wales have, moreover, shown that generally speaking the clovers that persist best into the second year are those harvested in Montgomery and in the Cotswolds; cases have, however, been noted where French and Canadian seed have also given plants that have "held" well.

Derbyshire.—Estimates made on the herbage on a series of plots three years down, showed that Broad Red Clover and Late-flowering Red Clover had persisted into the third year, but that there was twice as much clover on the latter plot as on the former.

Devon, Cornwall and Leicestershire.—A number of instances were met with in these counties where locally grown Red Clovers had persisted well into the second year, but no comparative plots were available for investigation. The writer was informed that excellent and persistent strains of Red Clover were harvested in the Wadebridge and Morwenstowe districts of Cornwall.

It must, of course, be remembered that Red Clover, like White Clover, is a common indigenous plant on British grass lands, and is greatly increased by dressings with phosphatic manures. Whereas White Clover may often make a strong indigenous appearance on a prepared ley (even when Wild White Clover is not sown) Red Clover seldom comes in by itself before about the fifth year, and since it is not a stoloniferous plant it does not gain on the ground with the rapidity of White Clover. The fact remains, however, that indigenous Red Clover is a persistent perennial, which, like Wild White Clover and other indigenous clovers, does not appear to be subject to clover sickness. Red Clover, although certainly a native

* It was unfortunately impossible for the writer to visit these plots either at the time of cutting the first hay crop or in the second year.

plant, only locally manifests itself as a really abundant indigenous constituent in old grass lands, and is usually more plentiful on meadows than pastures. Observations suggest, moreover, that indigenous Red Clover shows partiality for, or at least becomes more abundant on, heavy soils. It was found plentifully on Boulder Clay at Saxmundham, on very retentive clays in Dorsetshire, and was a dominant plant on certain heavy soils near Holsworthy, Devon. In Central Wales also it is sometimes locally abundant on heavy soils, and experience suggests that it is actually favoured by large and frequent dressings with farmyard manure.

It would seem evident from the above considerations that genuine Late-flowering Red Clover is a definite variety, and is a most valuable plant for leys of longer duration than one year; and it should be remarked that it also bulks very largely in the first hay crop. It is desirable that genuine stocks of this clover should be greatly augmented. The evidence suggests that "Perennial Red Clover" and "Cowgrass" are frequently nothing but trade names, and do not behave in a manner at all different from the ordinary Broad-leaved Red Clover. There can be little doubt also that the seed of Wild Red Clover would be most valuable in the preparation of four-year leys, and would probably give rise to a Red Clover which would persist for the whole duration of the ley. It is, therefore, to be hoped that genuine stocks of this seed may, like Wild White Clover, become a commercial commodity.

Alsike Clover.—This clover is not an indigenous plant, and consequently does not occur on fields where it has not been sown.* Trials have not been made to estimate the relative value of English, Canadian and Continental stocks of seed, and no opportunity presented itself for making field comparisons. The available evidence shows, however, that Alsike Clover frequently persists well into the second year. At seven out of twelve centres in Central Wales Alsike persisted into the second year in greater amount than either Broad Red Clover or Perennial Red Clover; whilst at two centres only had it persisted in greater amount than Late-flowering Red Clover. On the average of the twelve centres, Alsike Clover (in the second year) contributed 3·5 times as many plants per acre as either Broad Red or Perennial Red Clover; whilst Late-flowering Red Clover contributed 5·5 times as many plants as Alsike Clover. Data collected in other districts also gave

* Except, of course, where it may have been introduced as an impurity in other seeds, or accidentally introduced by other means.

evidence of the greater numerical persistence of Alsike Clover than of Broad Red or ordinary Cowgrass or Perennial Red Clover; whilst an estimate made on plots on the Millstone Grit in Derbyshire showed both Alsike and Late-flowering Red Clover in appreciable amount in the third year; the latter species, however, contributed twice as many plants to the acre as the former. In the Ulverston district of Lancashire Alsike Clover was also found to be quite abundant in the third year. A number of observations made on leys in their first year, at high elevations in Central Wales, had shown, moreover, that Alsike Clover often survives exceptionally cold and wet winters very much better than any of the varieties of Red Clover, and this would seem to be true also of much of the high land of Derbyshire and Lancashire.

When Red Clover and Alsike Clover are included in a mixture, and both clovers "take" equally well, all the varieties of Red Clover usually contribute more to the first hay crop than does Alsike Clover. Average figures obtained from seven of the twelve centres previously referred to in Central Wales, where the hay was weighed, showed the following relationships:—

Plot 1	{	Broad Red Clover contributed	26 per cent. by weight to the first hay crop.
		Alsike Clover contributed ..	7 per cent. by weight to the first hay crop.
" 2	{	Perennial Red Clover contributed	20 per cent. by weight to the first hay crop.
		Alsike Clover contributed ..	13 per cent. by weight to the first hay crop.
" 3	{	Late-flowering Red Clover contributed	44 per cent. by weight to the first hay crop.
		Alsike Clover contributed ..	5 per cent. by weight to the first hay crop.

At the only centres—two out of twelve—where Alsike Clover contributed a greater bulk to the first year's hay than the varieties of Red Clover, the Red Clovers had almost completely failed to "take."

From the above it seems evident that Alsike Clover is especially valuable for two chief reasons: firstly, it safeguards a stand of clover in the first year, and should, therefore, always contribute to mixtures in wet and cold districts,* and secondly it persists into the second and third year better than Broad Red or the ordinary commercial Cowgrass or Perennial Red

* It is also far less liable to clover sickness than the Red Clovers, and should also be a constituent of mixtures in clover-sick districts.

Clovers. The genuine Late-flowering Red Clover, however, usually persists better than Alsike, and also tends to suppress Alsike Clover in the first year, consequently these two plants are not complementary to each other, and should not both be included in large amount in the same mixture.

White Clover.—In order to form a just estimate of White Clover it will be necessary to differentiate between (1) Wild White Clover, (2) Commercial White or Dutch Clover (*a*) harvested in England, and (*b*) harvested in America or on the Continent.

(1) *Wild White Clover.*—This is the native plant which is indigenous on grass lands throughout the country, occurring as it does in large amount on the best fattening pastures, and frequently also on quite poor types of grass-land. It is a plant which if present on a field even in minute quantities responds freely to basic slag, and rapidly increases in amount under the influence of this manure.

The great value of Wild White Clover in the formation of artificial grass depends largely on the degree of rapidity with which it forms a sward, and thus keeps out weeds; and its effect on the fertility of the land for subsequent arable crops when the turf is broken and the residues are ploughed down. Professor Gilchrist and others have also proved that an abundance of White Clover in a sward has the effect of adding to the productiveness of the hay crop over a number of years,* and that it adds materially to the grazing value of pastures.

It is unfortunate that many of the trials on Wild White Clover have not been so designed as to take into account the indigenous unsown plant, and that in many cases where excellent results have undoubtedly followed upon the use of Wild White Clover, it has not been possible to form a proper quantitative estimate of these results, owing to the absence of control trials. The following evidence may, however, be cited:—

Central Wales.—Four plots were put down in 1915 on a poor field at about 900 ft. above sea level. The mixture was the same in each case except for the following variations:—Plot 1, $\frac{3}{4}$ lb. of Wild White Clover; Plot 2, $\frac{3}{4}$ lb. Commercial White Clover; Plot 3, no White Clover; Plot 4, 2 lb. of Commercial White Clover.

An estimate was made 18 months later as to the abundance

* "Trials of Wild White Clover," by Douglas A. Gilchrist, M.Sc., F.R.S.E.
This *Journal*, Vol. XXII., No. 11, February, 1916, p. 1063.

of White Clover on the plots. The average results may be expressed on a comparative scale as follows :—

Indigenous White Clover, unsown	100
$\frac{3}{4}$ lb. Commercial White Clover	120
2 „ Commercial White Clover	240
$\frac{3}{4}$ „ Wild White Clover	410

At two other centres at about 700 ft. the results at 18 months were as follows :—

Indigenous White Clover, unsown	100 and 100
1 lb. Commercial White Clover	300 „ 240
$\frac{1}{2}$ „ Wild White Clover	385 „ 350

Estimates were also made at twelve centres after the plots had been down for 28 months, and again expressing the Indigenous White Clover (unsown) at 100, the average results may be expressed as follows :—

Indigenous White Clover, unsown	100
1 lb. Commercial White Clover	90
$\frac{1}{2}$ „ Wild White Clover	395

It should be added that, on the average of all the centres at 28 months, weeds were twice as plentiful on the Commercial White Clover Plots (least clover) as on the Wild White Clover Plots (most clover).

At every centre the Wild White Clover Plot had beaten the Commercial White Clover Plot and the Indigenous (unsown) Plot, whilst at six of the centres the unsown plot had actually beaten the Commercial White Clover Plot.

It has not been possible to make estimates in this district on plots where Wild White Clover had been included in the mixtures that had been down for longer than about 28 months. Estimates and observations made on leys three and four years down, both when ordinary Commercial White Clover had been used, and when no White Clover had been sown (*i.e.*, when the White Clover on the fields was the locally indigenous plant, having come in naturally) supply further data. A series of trials three years down at about 750 ft. showed that the plots upon which 2 lb. of Commercial White Clover had been included in the mixture, actually contained less than half as much White Clover in the sward as the plots where no White Clover of any sort had been sown. The field had had a dressing of superphosphate with the last corn crop, but no phosphatic manures were subsequently added to the sward. White Clover (unsown) frequently contributes 10 per cent. to 15 per cent. of the ground herbage (on basis of number of plants per unit of area) by the

third and fourth year on leys in this district,* an amount which it may be safely said is not exceeded when Commercial White Clover has been included in the original mixture, whilst under the influence of lime and liberal dressings of basic slag cases have been noted where the unsown and indigenous contribution of this plant amounted to as much as 34 per cent. in the third year. An interesting case has also been noted where this plant and Rough-stalked Meadow Grass had together made an indigenous (unsown) contribution to the sward of 35 per cent. in no more than two years.*

North Wales.—Trials conducted by Jenkin† have shown that on the average of a number of plots, 2 lb. per acre Wild White Clover give somewhat better results at 18 months than Commercial White Clover, whilst at 30 months, on the average, the Wild White Clover covered nine times as much ground as the Commercial White Clover.

Staffordshire.—A number of leys in which either Wild White or Commercial White Clover had been included in the mixtures were visited. At three to four years all of these showed to the marked advantage of Wild White Clover, as the following comparative figures (the average of five sets of comparisons) indicate :—

Unsown Indigenous White Clover	100
1 lb. Commercial White Clover	100
1 „ Wild White Clover	426

On a field eight years down, however, unsown Indigenous White Clover was but little less plentiful than Wild White Clover. With but one exception weeds were decidedly less plentiful on the fields where Wild White Clover had been included in the mixtures.

Herefordshire.—Mr. Porter has conducted plot trials in this county, which have demonstrated the value of Wild White Clover.‡ Fields three and six years down were remarkable for a great development of Wild White Clover; comparison between a plot sown with a good mixture, including Wild White Clover, showed over five times as much White Clover at three years as the rest of the field where White Clover had not been sown.

The influence of Wild White Clover in suppressing Bent,

* See Pasture Problems (c) footnote p. 1281.

† "Ordinary White Clover Seed *versus* Wild White Clover Seed," by T. J. Jenkin, B.Sc.; this *Journal*, Vol. XXIII., No. 12, March, 1917, p. 1202.

Yorkshire Fog and weeds was again demonstrated, and is indicated by the following comparative figures:—

Field Three Years Down.

			<i>Wild White Clover included in the Mixture.</i>	<i>No Wild White Clover included in the Mixture.</i>
White Clover	575	100
Bent	68	180
Yorkshire Fog	24	96
Weeds	40	156

Lancashire.—Several instances of the value of Wild White Clover were seen in this county, more particularly in the Ulverston district, where, as in other localities, it had a decided influence in suppressing weeds, and at two and three years had added very much to the amount of White Clover on the plots. Indigenous White Clover, however, gains rapidly on many fields in this district, and in one instance was nearly as plentiful at three years as when the seed of Wild White Clover had been included in mixtures.

Leicestershire.—A 2-year ley was visited, 1 lb of Wild White Clover having been included in the mixture; the field was exceptionally free from weeds, and White Clover was abundant on the sward.

From the above facts it would seem evident that in the majority of cases the inclusion of even small amounts of Wild White Clover in a mixture begins to exert a beneficial influence on the herbage after about 18 months, and by 28 to 30 months will have given a decided character to the sward—a character that can seldom, if ever, be obtained so quickly by the reaction of slag on the unsown indigenous plant. In certain localities, especially those of high rainfall, *c.g.*, in Central Wales and the Ulverston district of Lancashire, it not infrequently happens, however, that after the lapse of four, or even three years, no great difference is to be seen between fields or plots sown with Wild White Clover, and those where the White Clover present has been solely due to the natural development of the unsown indigenous plant. The value of Wild White Clover as a means of suppressing weeds is, moreover, seen to be more fundamental than is generally realised. In this connection it is necessary to emphasise an important symbiotic relationship that undoubtedly exists between Indigenous White Clover and Indigenous Rough-stalked Meadow Grass, the two together often rapidly forming a close sward which tends to dominate

the ground flora, and thus to suppress mat herbs and other weeds natural to temporary leys.

Jenkin has furthermore remarked that indigenous Wild White Clover tended to be plentiful on certain plots sown with Rough-stalked Meadow Grass, and a case has been previously referred to where Rough-stalked Meadow Grass and White Clover had dominated the sward on a ley in the third year, although neither plant had been included in the original mixture. Evidence collected in Central Wales and in the districts visited in 1917 has conclusively proved that when Wild White Clover (the indigenous plant) was included in a mixture the Rough-stalked Meadow Grass was usually far more plentiful than when it was not included, and this both when Rough-stalked Meadow Grass was left to make an indigenous (unsown) appearance and when the commercial seed was sown. Comparisons in Staffordshire showed indigenous Rough-stalked Meadow Grass to be nearly twice as plentiful on 2 and 4 year leys sown with Wild White Clover as when this plant was not included. Mr. Porter's trials in Herefordshire also gave evidence of the remarkable connection between the development of these two plants; both had been included in mixtures, and the excellence of the sward on 3-year old leys was in no small measure due to the successful development of Rough-stalked Meadow Grass and the paucity of weeds.

It must not, of course, be supposed that Wild White Clover will always succeed when included in a seeds mixture; there is always the risk that this, like other seeds, may fail to "take." Jenkin found that a partial failure resulted (at 18 months) at one of his centres following upon a dressing of basic slag and sulphate of ammonia, which produced a very heavy crop.

Partial failure also occurred at two centres in the case of the Central Wales trials, where the first hay crop had been exceptionally heavy (although no artificial manures had been applied). The greatest success was, moreover, achieved at the single centre where no hay had been taken.*

The evidence suggests that the seed of Wild White Clover should be included in all mixtures for three- and four-year leys;

* Manurial trials on permanent grass have demonstrated that inorganic nitrogenous manures depress clover development (see Pasture Problems (b) footnote p. 1281); it would seem from the above, however, that in the case of young leys, any course that makes for an exceptionally heavy hay yield may have a disastrous effect on White Clover (even after the seeds have successfully "taken"), and that the bad effect of nitrogenous manures may often be in part due to this secondary cause. Single small dressings of nitrogenous manures (including liquid manure) often have no depressing influence on Red Clover.

it hastens sward development, encourages Rough-stalked Meadow Grass, keeps out weeds and makes for fertility. As to whether it should be included in mixtures for two-year leys or for permanent grass will depend on local conditions. It is certain, however, that in the best interests of agriculture, far larger supplies are urgently needed, and that the price of the seed should not be allowed to stand at its present exorbitant level.

(2) *Commercial White Clover*.—The writer is not aware that trials have been conducted to estimate the relative value of White Clover harvested in America, on the Continent, or from ordinary commercial seed in England. The trials referred to above clearly show that Wild White Clover produces both a more lasting plant than does the ordinary commercial seed, and also that it forms a sward very much more quickly. Observations made on leys in Dorset, however, give evidence to show that in some instances commercial seed harvested in that county give results nearly, if not quite as good as those obtained from the use of Wild White Clover. It was ascertained that White Clover is frequently harvested from leys that have been down 3 or 4 years, by which time a considerable amount of indigenous (unsown) White Clover would often have made an appearance. The parent seed used in the preparation of these leys, although perhaps originally the progeny of seed of foreign origin is, moreover, frequently obtained from seed harvested on the same or adjoining farms the year previously; consequently in districts where it is the practice to postpone harvests until the third or fourth year, the stocks freed year by year by a process of elimination and substitution become more and more "natural." It would appear, therefore, that "English" White Clover, although generally speaking of less value than "Wild White" Clover, is on the average of decidedly greater value than "Foreign" White Clover in the preparation of two- and four-year leys.

There is evidence for supposing that although ordinary Commercial White Clover, especially when sown at the rate of 2 lb. to the acre and upwards, will produce abundance of White Clover for a two-year ley—that this great development of a short lived variety of the plant tends to suppress or actually kill the indigenous (unsown) variety, and thus at three, four or five years a plot or a field sown with a mixture containing no White Clover may actually have more, and in many cases altogether more clover in the herbage than one originally sown with Commercial White Dutch Clover.

Yellow Suckling Clover.—This plant, like White Clover, is strongly indigenous in Britain, but as an abundant contributor to our grass-lands is much more localised. It is very plentiful in many parts of Devon, and in Central Wales, where it may become almost the dominant plant, especially on the aftermath. In these districts this clover is held in high esteem by flock-masters for the purpose of fattening lambs on fields after the hay has been harvested. In the writer's view Yellow Suckling Clover should be regarded as a valuable herbage plant in regions of high rainfall, and on non-calcareous soils where it is difficult to obtain good "stands" of Red Clover or even of White Clover. In Central Wales it usually makes an unsown appearance in about the third year, and attains to maximum development by about the fifth or sixth year. On plots at the Seale-Hayne Agricultural College, Devon, sown five and seven years ago with an Elliot mixture, Suckling Clover, although, of course, not included in the mixture, proved to be the dominant or co-dominant plant when the plots were visited in 1917. Plot trials in Central Wales, when the commercial seed was included in mixtures, and also observations made on leys where the seed had been used, have not given uniform results. At two centres in the second year, there was decidedly more Suckling Clover where the seed had been sown, but, generally speaking, its inclusion in mixtures has not proved an economic success, and there can be little justification for its use unless a good "plant" can be obtained by the second year, *i.e.*, as soon as the Red Clover fails and before the Suckling Clover would have made an indigenous appearance. The commercial seed often consists of upwards of 50 per cent. "hard" seed, and is, in the generality of cases, of foreign origin.

Trefoil.—This is a valuable plant for short leys for sheep grazing, especially on calcareous soils, and for resowing gaps in rotation leys. There does not, however, appear to be any reliable evidence as to the rival merits of English and French seed. The seed of this plant is both cheap and free from weed seeds, and it is consequently used to a large extent in mixtures for leys of two to four years' duration, quite regardless of soil and climatic conditions. In Central Wales, especially at high altitudes on non-calcareous shales, it is invariably a total failure from seeding. At the 12 centres in Central Wales previously referred to, Trefoil only contributed an appreciable amount to the herbage at two centres, and at each of these it developed in irregular patches only, and tended to suppress more valuable

plants. Trefoil was included in some of Mr. Porter's mixtures in Herefordshire, but had completely died out by the third year; on very poor sands in Lincolnshire it had, however, from seeding, maintained itself in moderate amount for four years. This plant is generally included in mixtures for three- to four-year leys at high elevations in Derbyshire and in the Ulverston district of Lancashire. In Derbyshire it may sometimes be useful in the first year if the Red Clover fails, but Alsike Clover would probably serve the purpose equally well. Trefoil was not seen in older leys to any considerable extent, and it would seem difficult indeed to make a case for its inclusion in mixtures in the Ulverston district. It is beyond dispute that in many districts Trefoil is quite a worthless plant, and it is very doubtful if it should be used for three- to four-year leys (except possibly in a few well-defined localities), in as much as, if successful, it only tends to suppress more valuable herbs.

GRASSES.

It was not possible to collect accurate data as to the relative success of the various grasses when seed of different countries of origin was employed. Plots put down by farmers in Central Wales with mixtures supplied by leading seed houses have frequently come under observation. The mixtures have usually been substantially the same; it has been noted on several occasions, however, that certain species of grasses have succeeded much better on one plot than the others. This has applied in particular to Cocksfoot, Timothy, Rough-stalked Meadow Grass and Tall Fescue; and it is not improbable that the source of origin of the seed may afford the solution to a somewhat baffling problem.

Perennial Rye-grass.—Stapledon and Jenkin* have shown that in Central Wales Perennial Rye-grass usually falls off rapidly by the third or fourth year after seeding. The evidence collected during 1917 showed that the same was true in the majority of English districts visited. The Perennial Rye-grass found in the herbage on prepared leys in the fifth and subsequent years is in most cases probably almost solely of indigenous origin. In districts where Perennial Rye-grass is not indigenous, the grass disappears from the herbage in about the fourth year, its place first being taken by Yorkshire Fog and Soft Brome Grass, and later by Bent, Sweet Vernal Grass and the Fine-leaved Fescues.

* See Pasture Problems (c) footnote, p. 1281.

The practice of introducing a high proportion of Perennial Rye-grass into mixtures intended for two- to four-year leys is undoubtedly a mistake, but it is a practice which dies very hard. Perennial Rye-grass contributes to the herbage in the first hay crop and in the second year more or less in proportion to the amount of seed sown. Provided seed of good quality is used, the available evidence, however, indicates that 14 lb. to 16 lb. should be regarded as the absolute maximum seeding for one- or two-year leys.*

The trials in Central Wales showed that 14 lb. of Perennial Rye-grass included in a mixture contributed 55 per cent. to the first hay crop; whilst a sowing of 7 lb. gave a contribution of 40 per cent. In the second year it was found that there was one-third as much Rye-grass again on the 14-lb. plot as on the 7-lb. plot.

Evidence collected in Staffordshire, Herefordshire and Derbyshire, and on fields in Central Wales, showed that by the third or fourth year a sowing of about 6 lb. to 7 lb. per acre actually gave rise to more Perennial Rye-grass than a sowing of 10 lb. to 16 lb. Fields down eight to ten years or longer may be said seldom, if ever, to show Perennial Rye-grass in proportion to the seeding; indeed, more often than not this grass is at this stage most plentiful on the unsown plots. This was well exemplified on the Saxmundham plots, where (at 14 years) if the average contribution of Perennial Rye-grass on the sown plots is expressed as 100, that on the unsown plots was 180.

It would appear from the above evidence that ordinary commercial Perennial Rye-grass, in a great many districts, should not be sown in excess of about 7 lb. per acre for three- and four-year leys, provided that by the inclusion of other species a sufficiently good herbage can be secured during the first and second years. It would seem evident also that the seed of the indigenous variety would give rise to a more persistent plant than does the ordinary commercial seed.

Timothy.—Although Timothy is an abundant indigenous plant on many types of grass land, it does not seem able to establish itself unsown on prepared fields earlier than about the eighth year. The evidence suggests that it succeeds from sowing on a great variety of soils—even on such as are relatively poor, provided the rainfall is high. It contributes to the first

* * It should be emphasised that it is almost impossible to obtain Perennial Rye-grass absolutely free from Yorkshire Fog and Soft Brome—consequently the heavier the seeding the more of these weed seeds will be introduced.

hay crop in proportion to the seeding.* The Central Wales trials showed that when sown with upwards of 14 lb. of Rye-grasses, 3 lb. to the acre gave five times as much Timothy in the first hay crop as 1 lb., and when sown in but slight competition with Rye-grasses, 3 lb. gave about twice as much Timothy as 1 lb. It was also evident that Timothy bulked rather more heavily in the first year when sown with little or no Rye-grass than when either Perennial or Italian Rye-grass in liberal quantity was included in the mixture. In the second year, however, this early competition with Rye-grasses had not much hampered the production of Timothy on the plots. The plots sown with 2 lb. and 3 lb. to the acre, moreover, contained about one-third more Timothy than those sown with 1 lb. Fields six years down in Staffordshire, when 2 lb., 3 lb. and 4 lb. of Timothy, respectively, had been included in the mixtures, showed a contribution of this grass to the herbage in the relationship of 100 : 200 : 220.

It is probable that Timothy should be used extensively for four-year leys, and that the seedings should more often be 3 lb. to 4 lb. to the acre than 1 lb. or 2 lb. It reaches maximum development in the first year when sown alone or in but slight competition with Rye-grasses; but only in the second year when Rye-grasses in large amount are also included in the mixture. It continues abundant for varying periods according to the soil, but on all but the best soils falls off fairly rapidly after the fifth or sixth year, and may completely disappear by the eighth to tenth year.

Cocksfoot.—The behaviour of Cocksfoot is perhaps more uniform over a great variety of soils than any of our important grasses. No single case of complete failure was noticed in connection with the 1917 investigations, and this grass invariably succeeded on four- to six-year leys, more or less in proportion to the seeding up to a maximum of about 10 to 12 lb. per acre in well-balanced mixtures. Cocksfoot attained to its greatest luxuriance on leys in Devon, Cornwall, Lancashire and Staffordshire, and was least successful on certain very poor soils in Lincolnshire.

The trials in Central Wales afford valuable information as to the behaviour of Cocksfoot. The yield of the first year's hay[†] crop was estimated at six centres.[‡] It was found that at

* When included in ordinary mixtures this is probably true up to a maximum sowing of 5 to 6 lb. per acre.

† The estimate was made by cutting the produce from 10 measured areas (a foot square) on each plot. The green grass was taken away in sacks, made into hay on the laboratory floor and eventually weighed.

one centre only was a higher yield of hay obtained in the first year from the use of much Rye-grass and little Cocksfoot (Plots 1 and 2) as compared with the yield from Plots 3 and 4, where about 14 lb. of Cocksfoot were sown in conjunction with no more than 2 lb. of Rye-grass. At three centres Plots 3 and 4 gave a yield in excess of Plots 1 and 2 of from 8 to 17 cwt. The average yields at all the centres were, for Plots 1 and 2 together, 31 cwt. per acre, and for Plots 3 and 4 together 37 cwt. per acre. On Plots 1 and 2 Cocksfoot only gave an average of 4 per cent. to the first year's hay crop, but contributed an average of 16 per cent. on Plots 3 and 4. Estimates made on the plots in the second year, moreover, showed that Cocksfoot, when not set to compete with the Rye-grasses, had contributed about 40 per cent. more to the herbage than when Rye-grasses in excess of 9 lb. to the acre had been included in the mixture.

Estimates made on plots three years down showed that Cocksfoot (sown either in small or large amount) may not recover from early competition with Rye-grasses even by the third year.

It is probably not too much to say that Cocksfoot is the most generally successful of all the commercial seeds for temporary grass. For unlike Rye-grass and Rough-stalked Meadow-grass it is not a grass which makes a rapid indigenous appearance; indeed, in many districts, although a hedgerow plant, it is not a plentiful constituent of tumble-down leys or unsown permanent grass. Thus in the case of a three- to six-year ley the money spent on Cocksfoot is justified to a greater extent than on almost any other herbage plant, *because Cocksfoot contributes to the herbage for the whole period, and its contribution is due almost solely to the seed sown.* The farmer does not, of course, appreciate this when comparing the price of Cocksfoot with Rye-grass.

The management of Cocksfoot is not well understood; for pastures it must be sown thickly, say a minimum of 6 lb. per acre, and stocked heavily. For meadows 2 lb. to 4 lb. may be enough, the smaller sowing being used when Rye-grass is relied upon to give the first year's hay crop. Cocksfoot leys should always be put up for hay early, cut early, and dressed with artificials, including nitrogen in small amount if liquid manure is not available. This grass responds particularly well to "feeding" and does not seem to lose permanency by early "forcing" and consequent heavy yielding. All the evidence indicates that Cocksfoot and Late-flowering Red Clover are an excellent combination for three-year leys; the hay crop in the

second year often being as heavy as that of the first, and sometimes containing nearly as much clover. Even a moderate seeding of Rye-grass (*e.g.*, 6 to 10 lb.) will have the effect of diminishing the yield of Cocksfoot in the first hay crop; this does not necessarily matter, but it may prevent the Cocksfoot establishing itself and dominating the hay crop in the second year. Cocksfoot when sown with much Rye-grass (14 lb. to 20 lb.) will not reach its maximum development before the third year, whilst without Rye-grasses it will reach its maximum in the second year. Unless well looked after and regularly 'dressed' Cocksfoot is likely to fall off after the fifth or seventh year, and in any event continues longer under meadow (or alternate meadow) than pasture conditions proper. It starts its growth early in the spring and under favourable conditions yields two heavy crops of hay in one year.

Tall Oat Grass.—This is a grass which seldom makes an appreciable indigenous appearance in prepared fields until after a considerable lapse of time, although both the ordinary and bulbous variety may spring up on land that has been newly broken and put down to grass again after but one or two arable crops. Tall Oat Grass is most successful in simple mixtures. It reaches maximum development in the first year when not in strong competition with other grasses, and in the second year when sown with excess of Rye-grasses. It may continue abundant until the fifth or seventh year, but is usually suppressed by strong competition, especially with Golden Oat Grass, by about the fourth or fifth year.

The contribution to the hay crop is deceptive. The Grass stands high above other plants and attracts the eye. The trials in Central Wales, when 3 lb. and 4 lb. were included in mixtures, showed a maximum contribution of 9 per cent. of this grass to the first hay crop and an average contribution of only 5 per cent.

During the early years it succeeds more or less in proportion to the sowing up to a maximum of about 5 lb. or 6 lb. per acre in well-balanced mixtures. It is probable that 4 lb. to the acre should be regarded as a minimum seeding. Tall Oat Grass comes into growth very early in the spring, and is then much relished by stock, but is quite neglected later in the season, and if not grazed early will hardly be touched by animals all through the year, whilst too heavy grazing early in the spring may completely destroy the grass.

Golden Oat Grass.—Golden Oat Grass, like Cocksfoot and Tall Oat Grass, does not make a rapid indigenous entry on

prepared fields, even in districts where it is an abundant constituent of old permanent grass ; this was very noteworthy in the Blackmoor Vale district. The investigations under review, however, showed it to be a grass which succeeds from sowing over a wide range of soils ; it never reaches its maximum development until the third year, and frequently not until later, and thenceforward holds the ground well, and may actually become a co-dominant grass. It enters into strong competition with Cocksfoot as well as with Tall Oat Grass. At Saxmundham it had lasted in appreciable amount for 14 years and was twice as abundant on the sown plots as on an old permanent pasture adjoining. Even $\frac{1}{2}$ lb. included in a mixture may sometimes produce material results, and 3 lb. would seem to be a maximum sowing in a well-balanced mixture.

It must be noted that reliable seed is at all times very expensive, and that it is a grass but little relished by stock. Golden Oat Grass probably has a certain value for six- to eight-year leys on some classes of rather poor soil, but it is doubtful if it would ever be remunerative in ordinary mixtures for three- to four-year leys.

Meadow Foxtail.—This grass was not included in the mixtures on any of the plots in connection with the trials at the 12 centres in Mid-Wales. It had, however, been tested in earlier experiments, and had never justified itself. Analyses made on a large number of fields in Central Wales, where the seed had been included in mixtures, have also clearly shown that the plant never established itself in economic amount when used as an ingredient in mixtures. The county investigations gave evidence in the same direction : for instance, on good soils in Staffordshire, where 2 or 3 lb. to the acre had been included in the mixtures, only traces of this grass were found on leys three to seven years old, on seven fields, whilst on one field (seven years down), where the grass was found in appreciable, although not abundant amount, it was more than probable that the indigenous species had begun to make an appearance. Permanent grass and fields down over 18 years on the same soils frequently contained considerable quantities of Meadow Foxtail. In Devon, Cornwall, Dorset and Lancashire, on fertile soils where the indigenous Meadow Foxtail contributed substantially to the older grass lands, it proved to be a grass which, even when included in mixtures, was never found as more than a distributed plant on three- to five-year leys. It would appear, therefore, that the ordinary commercial seed can practically never be relied upon to give a satisfactory

contribution of Meadow Foxtail when included in mixtures in this country. Consequently, since it is a grass which does not as a rule make a very appreciable indigenous appearance at all early, it is seldom met with on fields much less than ten years down, even on fertile soils.

Meadow Fescue.—This grass, although not quite so unsuccessful as Meadow Foxtail from seeding, gives no appreciable results in a great number of districts. It was included (4 lb. to the acre) in the mixture on one of the plots in the Central Wales trials. In the second year it was completely absent from the plots at three centres; only at two did it contribute appreciably to the herbage, and at both of these centres was quite insignificant in comparison with Cocksfoot and Timothy.

Meadow Fescue has, in the past, been largely used in mixtures in Central Wales; no case has, however, been met with where it has proved a real success, and at an altitude of above about 800 ft. it is almost invariably a complete failure.

This grass did not appear to have established itself either in Mr. Porter's trials in Herefordshire or in the trials on Millstone Grit in Derbyshire; and, as might have been expected, was a complete failure on poor sands in Lincolnshire. On fertile soils in Devon and Cornwall it was occasionally met with as a moderately successful contributor to three- and four-year leys. It was only in Staffordshire and Lancashire, and there on fertile soils, that Meadow Fescue, when included in mixtures, was found to be an undoubted success on three- to four-year leys. When successful it attains to maximum development in the third year, and when once established, retains its position until at least the seventh year. It was not found as a strongly indigenous plant in many of the localities visited; it is interesting to note, however, that it was undoubtedly indigenous in Staffordshire and Lancashire, that is to say, in just those districts where its inclusion in seeds mixtures was justified.

Tall Fescue.—This grass has not in the past been included in mixtures to anything like the same extent as Cocksfoot, Timothy, Meadow Fescue and Meadow Foxtail. It is a very variable grass, and undoubtedly includes a great number of botanical forms. Tall Fescue of commerce (the Rhenish variety) was tested on two of the plots (4 lb. and 6 lb. to the acre) in Central Wales. The grass did not contribute to the first hay crop, but in the second year at three centres had made a definite, although comparatively slight contribution to the herbage. On the average of all the centres it was rather more successful than Meadow Fescue.

In Herefordshire it had made a substantial contribution to the herbage by the third year on a field where Meadow Fescue had failed, while in Derbyshire only traces of the grass were found on a field of similar age. In Devonshire, on leys five and seven years down, 2 lb. to the acre had produced a considerable development of Tall Fescue; on one field it was co-dominant with Cocksfoot. The same was found to be the case in Cornwall. On clay soils over Oölite, both in Lincolnshire and on the Cotswolds, Tall Fescue, when sown, often becomes an abundant grass on leys down over five years. On favourable soils it is, moreover, a grass which from sowing becomes quite permanent. It contributed 21 per cent. to the herbage on a field 16 years down on the Cotswolds, and it was among the four most plentiful grasses on plots 14 years down at Saxmundham.

Probably Tall Fescue is not a grass that would often pay for inclusion in mixtures for leys of under four years' duration, but it is undoubtedly a valuable plant for leys of four years and upwards, although it is not possible at present to predict upon what classes of soil it will succeed best. It would seem, however, to have a proved value for certain classes of clay soil.*

Certain very fine strains of Tall Fescue have been noted as a hedgerow and roadside plant in parts of North Devon, and in the Folkingham and Sapperton districts of Lincolnshire, and as an indigenous plant it would almost certainly repay investigation.

The Fine-leaved Fescues.—These Fine-leaved Fescues include the "Hard" "Red," "Sheeps," and "Chewings" Fescue of commerce, and the various smaller Fescues of our grass lands. They represent a number of botanical species and varieties, and demand very detailed study. For the present it will be sufficient to remark that the evidence suggests the following generalised conclusions. On the majority of soils the commercial seed, when included in well-balanced mixtures, does not give tangible results. Noteworthy exceptions were met with in the Ulverston district of Lancashire, on some poor sands in Staffordshire and Lincolnshire, where these grasses became plentiful from sowing by the third year, and persisted in some cases to the fifth or seventh year. Where successes were met with the seed used had been "Red" or "Hard" Fescue, and not "Sheeps" Fescue, and in these districts indigenous Fine-leaved Fescues were also plentiful. The indigenous

* Failures would seem often to have been due to the use of inferior seed in the first instance.

Fescues do not, however, usually make an appreciable unsown appearance before the third year at the earliest. Under natural conditions where the Fine-leaved Fescues are abundant indigenous plants—on heath pastures and mountain sheep-walks—they are usually the dominant or co-dominant elements of the flora. It is of interest, therefore, to note that the commercial seed can be made to succeed when co-dominance is assured, *i.e.*, by excessive, almost pure, sowings under lawn conditions. Some of the native varieties of *Festuca rubra* do not seem to require conditions of absolute dominance and might be very useful as herbage plants, but it is doubtful if *Festuca ovina*, an essentially poor-place plant, deserves consideration as even a potentially valuable grass for the formation of temporary leys. The commercial seed of the various Fine-leaved Fescues does not appear to give rise to a herbage relished by stock.

Rough-stalked Meadow-grass.—The commercial seed of this grass has an undoubted value in the preparation of four-year leys. In Central Wales and in other regions of high rainfall it succeeds even on relatively poor and thin soils. The Central Wales trials showed it to be a grass which contributes quite appreciably to the first year's hay crop. It failed at only one centre, and on the average of all the centres 2 lb. to the acre gave a contribution of 3.6 per cent. by weight to the first year's hay; at one centre it actually gave 10 per cent. At all the centres, with one exception, it had, by the second year, thoroughly established itself, and was to be counted amongst the four most successful plants on the plots. Good results in the second to fourth years from the inclusion of the seed in mixtures were also noted in Herefordshire, Derbyshire and Leicestershire.

Rough-stalked Meadow-grass makes a rapid indigenous appearance on many soils, and the plant may sometimes be as abundant on fields down for over three years when the commercial seed has not been included in mixtures as when 1 to 2 lb. per acre have been sown. This has proved to be the case in Central Wales, Staffordshire and the Ulverston district of Lancashire. The indigenous plant will, more often than not, have caught up its sown counterpart by about the sixth year, but at Saxmundham, even fourteen years after seeding, the plots where 3 lb. to the acre had been included in the original mixture showed to the advantage of those where no Rough-stalked Meadow-grass had been sown.

As a pasture plant the great value of Rough-stalked Meadow-grass is dependent on its capacity for sward formation

in conjunction with Wild White Clover. When employed in mixtures it should be used in moderate amount, say $1\frac{1}{2}$ to 2 lb. per acre—sowings of but little more than $\frac{1}{2}$ lb. are usually without effect. It is not a grass greatly relished by stock.

Crested Dogtail.—This grass does not succeed from sowing on very poor sands, and is not an abundant indigenous plant on such soils. It is strongly indigenous on practically all other types of soil, being met with as a co-dominant plant alike on dry calcareous fields and on ill-drained meadows. It proved to be a valuable contributor to the first hay crop in the Central Wales trials. On the average of all the centres it gave 6 per cent. by weight to the hay, with a yield of over 10 per cent. at three centres. By the second year Crested Dogtail had established itself well at every centre. The evidence obtained both in Wales and in the several districts visited in England suggests that it is a grass which often becomes as abundant by the fourth or fifth year, when left to make an indigenous appearance, as when included in mixtures, and that by the tenth year or even earlier it will often be less plentiful on sown than on unsown plots or fields.

Crested Dogtail is much relished by stock, despite the fact that the flower heads are never grazed, and since it contributes more to the hay than is generally realised, it is undoubtedly a valuable grass for the formation of three- to four-year leys, and this applies equally to wet and dry districts.* It is probable that $1\frac{1}{2}$ lb. to the acre should be regarded as a minimum contribution to a well-balanced seeds mixture.

Smooth-stalked Meadow-grass.—This grass has not been met with in appreciable amount on fields investigated in Central Wales, and had not proved successful when included in seeds mixtures; nor, in the English districts visited, was evidence obtained that the commercial seed is of any value.

MISCELLANEOUS HERBS.

Chicory.—This plant, even in districts where it is indigenous, does not appear as a native plant on prepared or old grasslands. From sowing, it succeeds on a wide range of soils whether the plant is endemic to the locality or not. It established itself well at all the centres in Central Wales; it gave a contribution of about 5 per cent. to the first hay crop when 3 lb. per acre

* It is probable that the commercial seed of Crested Dogtail usually gives the best results in wet districts. This requires further investigation, since it is a grass which is chiefly recommended for inclusion in mixtures on dry soils. The fact that much of the commercial seed is now obtained from Ireland may, in part, account for its success under conditions of high rainfall.

was included in the mixture, and was practically as abundant in the second as in the first year. It had maintained itself in good amount for seven years in Devon and Cornwall, and in moderate amount for four years on poor sands in Lincolnshire ; in Herefordshire it had died out by the sixth year. Therefore Chicory is of decided value in the preparation of four-year leys, and this is especially so when grazing for sheep is required, for it makes an early growth in the spring. Three pounds is probably to be regarded as the maximum sowing per acre ; 4 lb. on plots in Central Wales produced more Chicory than was desirable.

Burnet.—This plant has an undoubted value on very poor sands ; it was more successful than Chicory on sands in Lincolnshire. It becomes, however, very woody after a few years, and should not be used in mixtures except on the poorest soils.

Yarrow.—This is a strongly indigenous plant on many soils, and when once established it would seem to remain permanent. Conclusive evidence of the plant having definitely established itself from seeding has not been obtained, and whether included in mixtures or not, it is seldom much in evidence before at least the third year. The opinion is held in several districts that Yarrow has a decided value for dairy cattle. It is a fact that the plant is frequently abundant on some of the best pastures in the country, and that it is grazed by cattle to a certain extent. Further information is required as to the economic value of this plant.

Ribgrass.—Ribgrass is still used in cheap seeds mixtures. It withstands drought well, and produces a herbage on very poor, sandy soils when almost everything else fails ; on such soils it is probably of decided value, but on good land the evidence suggests that it should not be included in mixtures.

SUMMARY AND GENERAL CONCLUSIONS.

An endeavour has been made to examine in some detail the behaviour of those plants, the seeds of which are commonly employed in the formation of both temporary leys and more permanent grass. It has been sought to contrast, as far as possible, the relative capacities for sward formation of indigenous species and their commercial counterparts, and to give some indication of the duration and year of maximum yield of both the sown and unsown varieties of the species in general use. It will be convenient firstly to summarise the evidence brought forward in the body of the article, secondly

to discuss the selection of a seeds mixture for a two-year and for a four-year ley in the light of this evidence, and thirdly to state a case for the systematic production of grass and clover seed in this country.

Summary of the Evidence brought forward.—The main facts may be usefully set out in tabular form as follows :—

Species.	The Permanency of Herbage Plants.			
	When Included in Seeds Mixtures.		When they make an Unown Indigenous Appearance.	
	Year of Maximum Yield.	Usual Duration.	Year of Entry.	Maximum Development.
Perennial Ryegrass	1	3—5	3—5	10 and upwards.
Cocksfoot	2—3	5—8 and frequently upwards	seldom before 5	10 and upwards.
Tall Fescue	3—5	8 and upwards	seldom if ever	—
Meadow Fescue ..	3 (only successful on certain soils).	7—8	about 6	15 and upwards.
Meadow Foxtail ..	(seldom if ever successful).	—	seldom before 10	20 and upwards.
Tall Oat Grass ..	1—2	5—7	seldom before 6	uncertain.
Golden Oat Grass ..	3—4	8 and frequently upwards.	seldom before 10	probably 15 and upwards.
Timothy	1—2	5—10	seldom before 8—10	probably 15 and upwards.
Rough-stalked Meadow-grass.	3—5	8; later probably chiefly indigenous.	2—3	May be as soon as 4 and upwards.
Fine-leaved Fescues	3 (seldom successful).	6; later probably chiefly indigenous.	3—4	30 and upwards.
Crested Dogstail ..	3—4	6—8; later probably chiefly indigenous.	2—3	7 and upwards.
Commercial Broad Red Clover, Cow-grass and Perennial Red Clover.	1	Frequently one only, sometimes 2 <i>ex</i> English seed.	—	—
Late-flowering Red Clover.	1; occasionally 2	2—3	—	—
Indigenous Red Clover.	no data	no data	seldom earlier than 5—6.	8 and upwards.
Commercial White Clover.	2	2—3 or occasionally 4.	—	—
Wild White Clover	3—4	10 and upwards	3—4	6 and upwards.
Alsike Clover ..	1	2—3	—	—
Yellow Suckling Clover.	probably 2	probably 2—3	2—3	4 and upwards.
Chicory	1—2	4—10	seldom if ever	—
Burnet	3	4 and sometimes upwards.	?	?
Yarrow	seldom before 4	8 and upwards	3—4	10 and upwards.

The above table cannot be regarded as complete, since it is not based on a sufficiently exhaustive enquiry; and the behaviour of all species will, of course, vary according to conditions of soil and climate. It is possible, however, as an outcome of the work so far conducted, to group the species into fairly well-defined categories as follows :—

A.—*Those species which, if not sown, will, in certain localities, never make an indigenous appearance, but which, if the ordinary commercial seed is sown, may become permanent contributions to*

the sward.—The number of species of which this may be said is but few. The outstanding examples are Golden Oat Grass and Tall Fescue, both of which frequently become permanent in the true sense of the word, when sown in districts where neither species is indigenous. In certain localities it would seem that Timothy behaves in a similar manner, whilst Cocksfoot, although it is seldom entirely absent as an indigenous plant, will frequently from commercial seeding contribute substantially to a permanent sward. There is evidence for thinking that in some localities Yarrow should also be added to this class.

B.—*Those species which, if the commercial seed is not sown, will make as great or greater contribution to a permanent sward as if the seed were included in mixtures.*—This applies to Red Clover (when ordinary commercial Cowgrass, Red Clover or Late-flowering Red Clover is sown), White Clover (when the ordinary commercial seed is used), Yellow Suckling Clover, Rough-stalked Meadow-grass, Crested Dogtail, and the Fine-leaved Fescues. It has been shown that the indigenous counterparts of all the above plants, with the exception of Red Clover, may make a substantial natural appearance on three- to four-year leys. In the case of White Clover, Rough-stalked Meadow-grass, the Fine-leaved Fescues and Crested Dogtail, there is strong evidence to support the view that in certain localities the inclusion of the commercial seed in mixtures may actually decrease the amount of these plants found contributing to the more adult herbage, say at about six years and upwards, and especially as the sward becomes older. It is a fact, however, that Rough-stalked Meadow-grass and Crested Dogtail on the soils that suit them, and the Fine-leaved Fescues on a few poor sands when included in mixtures, develop much more rapidly than when not sown, and that consequently the commercial seed, although not giving lasting plants, and being of no value in the formation of permanent pastures as such, is sometimes of decided value in the preparation of three- to four-year leys. This is particularly true in the case of Rough-stalked Meadow-grass, which has been shown to be complementary to Wild White Clover, the two together having a decided influence in the suppression of weeds.

C.—*Species which, in the past, have been largely included in "Trade" mixtures for the formation of leys and permanent grass over a wide range of soils, but which either succeed in a few localities only, or which practically never succeed from commercial seed.*

It must be emphasised that the inclusion of the seed of a species has not been justified unless it makes an appreciable contribution to the sward; a few plants scattered over a field is no evidence of success. Meadow Foxtail is the most striking example. It is a grass which would seem never to be a really economic success from sowing; and this is the more unfortunate, since the indigenous variety is one of our most valuable herbage plants, and is one which does not make an early natural appearance on prepared leys. In the past, the failure of Meadow Foxtail could have been attributed to the poorness of the seed; during the last decade, however, excellent samples of the commercial seed with a high capacity for germination have been freely put on the market.

Meadow Fescue, which is still largely used in proprietary mixtures, often to the extent of 4 to 6 lb. per acre, has proved to be as complete a failure as Meadow Foxtail in many, and perhaps the majority of, districts. It succeeds, however, in certain localities, especially on fertile soils. Smooth-stalked Meadow-grass is another species which, from commercial seeding, is but seldom successful, and the same is true of all the commercial varieties of the Fine-leaved Fescues, which but occasionally justify themselves, and apparently only on very poor sands. The aggregate waste of money resulting from the inclusion of these species in mixtures in unsuitable localities must have been very great, and it is to be hoped that they will never again be imported into this country in such large quantities as before the War.

D.—*Species which contribute largely to the herbage during the first year after sowing, and (a) which continue to gain on the ground, and will attain to maximum development within at least four years, and which, during this period, will always be much more plentiful when included in mixtures than when not sown, and (b) which attain to maximum development during the first year, and then either completely die out or fall off rapidly.*

This category includes what may be called the pivotal species in the preparation of one-, two-, three-, and four-year leys. Under (a) we have such valuable species as Cocksfoot, Timothy, Perennial Rye-grass (on some soils), Tall Oat Grass, Meadow Fescue (on a few soils), Chicory and Commercial White Clover, and under (b) the various varieties of Red Clover, Alsike Clover, Trefoil (on some soils), Italian Rye-grass, and on many soils Perennial Rye-grass should be included with these rather than with the plants that last for three or four years:

The Selection of a Seeds Mixture for a Two- or Four-year Ley.—It will be apparent from the above considerations that the number of species of which the commercial seed may be economically employed in the preparation of two-, three- and four-year leys, is not at present considerable. Those species which may be used with confidence are :—

Perennial Rye-grass, Late-flowering Red Clover and Alsike Clover for the first two years ; Cocksfoot and Timothy chiefly for the second, third and fourth years ; and Wild White Clover in conjunction with Rough-stalked Meadow-grass and Crested Dogtail. The object of including the latter is to hasten the formation of a bottom sward, suppress weeds, and ensure a good and leguminous herbage to plough down.

The actual amount of the several species to be used in a mixture will depend upon a number of considerations, which it is beyond the scope of this paper to discuss in any detail.

The following mixture, which has been largely employed in Central Wales, may be given as an example of what may be called a nucleus mixture for a four-year ley, and can easily be modified to meet local requirements :—

Perennial Rye-grass	7	-14	lb. per acre.
Cocksfoot..	6	-12	" "
Timothy	3	- 5	" "
Rough-stalked Meadow-grass	1½	- 2	" "
Crested Dog's Tail	1½	- 2	" "
Late-flowering Red Clover	3	- 4	" "
Alsike Clover		1	" "
Wild White Clover	½	- 1	" "

Total minimum seeding to acre, say about 28½ to 30 lb., and maximum, even if other species are added, about 35 lb.

In localities where Perennial Rye-grass contributes practically nothing to the second year's sward, excellent results are often obtained by excluding it altogether, and sowing up to 14 lb. Cocksfoot and 6 lb. Timothy. In the few localities where Meadow Fescue succeeds, the Perennial Rye-grass should not exceed about 8 lb., the Cocksfoot may be decreased and 6 lb. of Meadow Fescue added. Chicory, at the rate of 2 lb. to 3 lb. per acre, may be included with advantage, especially where spring grazing for sheep is required. It is sometimes necessary to sow a blend of Broad Red Clover and Late-flowering Red Clover, instead of relying solely on Late-flowering Red Clover, in order to ensure a clover aftermath following the first hay crop. On cold and wet soils it is usually advisable also to add to the amount of Alsike sown up to a maximum of 2½ lb. per acre. In some localities the inclusion of Rough-

stalked Meadow-grass or Crested Dogtail is not justified; it is then advisable to increase the quantity of Wild White Clover. Gilchrist has used the latter seed up to a maximum of 4 lb. per acre.*

A mixture for a two-year ley should not differ very much from that for a four-year ley. The inclusion of Rough-stalked Meadow-grass and Crested Dogtail is unnecessary. English White Clover could often take the place of Wild White Clover, or a blend of the two might be employed, and a blend of Broad Red and of Late-flowering Red Clover should always be used. The Rye-grass sowing should consist in part of Italian Rye-grass. There is evidence to show that it is economical to retain Cocksfoot and Timothy in most mixtures for two years, and on very dry soils the inclusion of Tall Oat Grass is often an advantage. The following mixture, recommended by Finlay† for ordinary average soils, may be given as an example of a nucleus mixture for a two-year ley :—

Perennial Rye-grass	13 lb. per acre.
Italian Rye-grass	5 " "
Cocksfoot	6 " "
Timothy	3 " "
Late-flowering Red Clover	1½ " "
Broad Red Clover	2 " "
Wild White Clover	½ " "
Commercial White Clover	½ " "
Alsike Clover	1 " "

Total seeding per acre say about 32 lb.

The Systematic Production of Grass and Clover Seed in this Country.—The foregoing suggestions as to seeds mixtures have been based on the known behaviour of the commercial seeds as at present available to the farmer. An ideal mixture for a temporary ley should provide a more complex herbage, and rapidly produce a sward more comparable with that of the best permanent grass-lands in the country.‡ Such a mixture would include grasses like Meadow Foxtail and Meadow Fescue, the more succulent of the Fine-leaved Fescues, and strains of Red Clover of considerable permanence. It must not, however, be supposed that because a great number of species do not

* The mixture advocated and successfully employed by Gilchrist is as follows :—16 lb. Perennial Rye-grass, 10 lb. New Zealand Cocksfoot, 4 lb. Timothy, 4 lb. Cowgrass (=Late-flowering Red Clover), and from 1½ to 4 lb. Wild White Clover.

† Finlay, W. M., "Rotation Grass": *The Scottish Journal of Agriculture*, Vol. 1., No. 4.

‡ It has often been noted that artificial grass when put down with a well-balanced seeds mixture contains considerably less weeds, even when 10 to 14 years down, than does genuine permanent grass.

succeed from the sowing of the commercial seed, that these species, as such, are unsuitable for the formation of temporary or permanent pastures. The success of the indigenous counterparts of practically all the species of commerce, when they once make an appearance on a field, and the rapid results obtained from sowing the seed of Wild (indigenous) White Clover, points irresistibly to the conclusion that the seed of our native herbage plants is likely to give far better results than the ordinary seed of commerce, so much of which is imported.

This reasoning should be applied not only to grasses like Meadow Foxtail and Meadow Fescue, which usually give negative results, but also to more successful imported grasses such as Cocksfoot. This is a grass which grows in great luxuriance in hedgerows and waste places, and it is more than probable that seed collected from such plants would bear a similar relationship to the seed imported from Denmark as that of Wild White Clover bears to ordinary White Dutch Clover.

It becomes, therefore, a question whether it is not in the national interest that an intelligent endeavour should be made to build up supplies of the seed of our more important herbage plants. To do this successfully involves scientific inquiry and investigation in the first instance, and in the last resort would demand the hearty co-operation of both farmers and seed merchants, since it would manifestly become necessary to grow stocks of grass and clover seeds on a far larger scale, and with very much more care than has heretofore been the practice in this country. With regard to the collection of seed and working up of stocks, two courses are open, namely, "bulk collection" and "individual collection." Bulk collection would simply entail the harvesting of certain species in bulk from such localities as they were known to grow in great luxuriance, and the subsequent building up of supplies. Individual collection would consist of taking the seed from carefully selected plants and building up improved strains by the methods of selection and hybridisation such as have been applied to cereals and roots in this country and elsewhere, and to herbage plants on the Continent and in America.

The first plan is, of course, that already employed in the case of Wild White Clover, and is one that might be applied to the more bulky plants which grow in large masses together. "Bulk" collection would be likely to be most valuable in the case of such grasses as Cocksfoot, Meadow Foxtail, Tall Cat Grass, Crested Dogtail, Rough-stalked Meadow-grass and

Wild Red Clover. The last three of these are in fact often by-products from Wild White Clover harvests, and can be secured off old permanent grass lands by the reaper. Cocksfoot, Meadow Foxtail and Tall Oat Grass often grow in great masses together—the first on hedges and roadsides and in gorse brakes (*e.g.* in great luxuriance in Devon and Cornwall); the second on certain rich water meadows and frequently on waste pieces of land about towns, and the third near the edges of woods. The seeds of these grasses could be harvested in considerable amount by hand.

Selection and other scientific methods of improvement should, of course, be applied to the above plants, and also in particular to Perennial Rye-grass, Tall Fescue, the Fine-leaved Fescues and Wild White Clover. Immediate benefits could not, however, be looked for on these lines, since the work would involve the accumulation of a great deal of data as to the sub-species and varieties of our native herbage plants followed up by prolonged and detailed research. An undoubted barrier to the introduction of grass and clover seed production on a large scale in this country is the careless manner in which these seeds are at present grown; little or no care is taken to produce clovers or rye-grasses from carefully selected strains, and in a high state of purity. Rye-grasses grown in the British Isles often contain excessive amounts of Soft Brome and Yorkshire Fog; whilst harvests of Red and White Clovers are frequently ruined by the quantities of Cranesbills, Ribgrass and Campions, and other weeds they contain. It has to be admitted that on the average the purity of British Clovers is far below that of imported stocks.* There would not seem to be much hope for improvement in this direction unless it were possible to found a well-conducted industry for the production of the seeds in question. It would probably also be necessary, if it is desired to encourage the production of the seeds of herbage plants in this country, to institute a system of inspection of growing crops and registration of stocks. The registration of stocks of Wild White Clover has been frequently advocated by competent authorities, and it cannot be denied that there are strong arguments in favour of doing so in the case of the seed of a plant of great value, which cannot readily be distinguished from the ordinary commercial commodity—arguments which

* The following average figures relative to impurity in Red Clovers were obtained at the Seed Testing Station in respect of the samples tested during 1917-18.

English Red Clovers	3.38 per cent.	Chilian Red Clovers	1.23 per cent.
French " "	3.00 " "	Canadian " "	1.41 " "

would apply with equal force to stocks built up from other indigenous plants.

It is beyond the scope of this article to inquire into the means whereby an industry might be established for the production of indigenous grass and clover seeds—whether, for instance, it could be set up on a voluntary and co-operative basis, and whether State intervention would be necessary with reference more particularly to crop inspection and registration of stocks. It is, at all events, much to be desired that any plans that may be initiated by private enterprise in the direction of producing home supplies of the seeds of herbage plants will be laid on thoroughly scientific lines, and that supplies of seeds will only be built up from stocks of proved productivity and hardiness, and preferably from those of *undoubted* native origin.

An investigation, undertaken on behalf of the Food Production Department, is now in progress with a view to collecting accurate information as to the value of indigenous seed. An endeavour is being made to collect supplies of the seed of certain species in order to ascertain the germination capacity of the native seed ; to compare the indigenous with the ordinary commercial seed when included in mixtures ; and to build up supplies of indigenous seed for the purpose of conducting large scale trials.

LAND SETTLEMENT IN THE MOTHER COUNTRY.

A FURTHER booklet (L.S. 9) under the above title has been issued by the English and Scottish Boards of Agriculture, with the approval of the Admiralty and the War Office, dealing with the question of the settlement of officers on the land after the War. An earlier booklet, which was reproduced in last month's issue of this *Journal*, p. 1152, treated the matter, broadly speaking, from the soldier's point of view. The pamphlet now under consideration enters into the question of the opportunities afforded rather to officers (under which term are included warrant officers, non-commissioned officers and men in the ranks, provided they are of suitable educational promise) to adopt agriculture as a means of obtaining a livelihood. The two publications should be read in conjunction, as certain features which appear in both, and were included in the previous *Journal* article, are not reproduced here. In

particular, the references to poultry-keeping, mixed farming, dairy holdings and fruit and market gardening, and advice as to the cost of renting or buying a holding have here been omitted.

TRAINING. — A training scheme for officers who desire to take up agriculture and require financial assistance from the Government for training in England or Wales has been devised on the following lines :—

1. The Government will give a limited number of scholarships (value varying up to £175 per annum and fees, for three years) to be held at an approved university or agricultural college in England or Wales by officers who are selected by the Board of Agriculture and Fisheries for the purpose. These scholarships are intended primarily for candidates who have had either previous experience of farming or a scientific education, or both, and who desire on completion of their training to apply for salaried posts of an educational character such as agricultural organisers, teachers of agriculture, county instructors, etc., or for posts as estate managers, etc. No precise indication can be given of the number or class of such posts which may subsequently be available, but they are likely to be small in number. The salaries range from £200 to £600, as a general rule ; but an officer starting in this line of life must, of course, expect to begin at the lowest rate.

2. The scheme just described is not, of course, a scheme of land settlement, or to take up an agricultural occupation such as a farm managership, intended for those who wish to farm on their own account when they have completed their training. For this latter class of officers it is proposed to offer a number of allowances (value £125 per annum for two years) to provide them with two years' residential training with an experienced farmer in England or Wales.

In both the above cases an additional allowance may be made to officers married before the date of the Armistice, 11th November, 1918, at the rate of £24 per annum for each child up to and including the age of 15 years, up to a maximum of £96 per annum.

Any officer who desires to be a candidate for a scholarship under the first part of this scheme, or for an allowance under the second part, should in due course fill up the form (L.S. 9A.)* attached to this booklet, headed "Agricultural Training for Officers," and attach it to Army Form Z.15 or Navy Form S.1299 (Civil Employment or Training Form (Officers)) when he receives it.

* Not reproduced here.

If an officer has already completed Army Form Z.15 or Navy Form S.1299 he should obtain another Z.15 or S.1299 Form from the Military or Naval Authorities and fill it up afresh, marking it clearly "Revised application," and attach to it the Agricultural Training Form.

If an officer has already been demobilised or released from the Forces he should apply to the nearest District Directorate—according to his respective place of residence in England or Wales—of the Appointments Department, Ministry of Labour, for an appropriate ex-officer's application form, and attach to it the Agricultural Training Form.

The Training Scheme above described does not apply to Scotland or Ireland, and any officer who desires agricultural training in either of these countries should not, therefore, fill in the Agricultural Training Form (L.S. 9A.), but should simply state on the Z.15, S.1299, or ex-officers' application form that he desires training in Scotland or Ireland, as the case may be.

SETTLEMENT.—As already indicated, officers who have capital and possess or acquire experience will probably find little difficulty in obtaining land through the usual channels and fitting themselves into the general agricultural system of the country, always assuming that they possess the necessary energy and ability to make a success. Those who possess or acquire experience but have insufficient capital will need to take advantage, as a general rule, of the facilities given to take up small holdings. They will, of course, desire to rise through the intermediate stage of the small holder to the position of the farmer, and it is the intention of the Government to provide every facility for that purpose.

Shortly, the openings offered in agriculture to officers desiring to settle on the land but possessing little capital are as follows :—

(1) Small holder with capital adequate for the purpose : Suitable land on reasonable terms with a prospect of making a comfortable living provided he and his family are prepared to work hard.

(2) Small holder with insufficient capital : The same advantages as under (1) with the prospect of an advance by way of loan to assist in purchasing seeds, stock and implements.

(3) Commissioned officers, but as a general rule only those who have risen from the ranks, are eligible for the Small Holding Colonies now being established by the Board of Agriculture, and

It is possible that as an experiment a special colony may be established for officers. These colonies are designed to establish settlers on the land on a communal and co-operative basis either as individual small holders or as members of a community sharing the profits derived from the working of the colony as a large farm. Facilities will be available for hiring machinery, implements, etc., from a central farm, and the colonists will have the benefit of advice and assistance from the Director of the Colony.

Forms of application for holdings on such colonies in England or Wales, and any further information required, can be obtained from the Secretary, Board of Agriculture and Fisheries, 4, Whitehall Place, London, S.W.1. Officers desiring to obtain holdings on colonies in Scotland should apply to the Secretary, Board of Agriculture for Scotland, 29, St. Andrew Square, Edinburgh.

Apart from a holding on a colony any officer who desires to obtain, after demobilisation, a small holding of not more than 50 acres in England or Wales, or of not more than 50 acres or £50 rental value in Scotland, should fill up the appropriate form (L.S. 9B.)* (attached to this booklet), and, if he is a military officer, hand it to the officer commanding his unit for transmission, in the case of England or Wales to the Clerk of the County Council at the county town of the county in which he desires to settle, or in the case of Scotland for transmission to the Board of Agriculture for Scotland. If he is a naval officer he should forward the form direct. Any officer who so applies for a small holding should attach a statement to Army Form Z.15 or Navy Form S.1299 that he has done so, mentioning the name of the county concerned.

Any officer already demobilised or released from the Forces who desires to obtain a small holding should send the Application Form (L.S. 9B.) direct to the Clerk of the County Council in England or Wales, or to the Board of Agriculture for Scotland, as the case may be.

In order to meet the special cases of officers who have sufficient agricultural experience but have insufficient capital, the Government propose to empower County Councils, or in Scotland the Board of Agriculture for Scotland, to advance to ex-Service tenants by way of loan money to assist in purchasing the necessary stock and implements for the purpose of working their holdings. This proposal is not yet an accomplished fact.

This booklet has been devoted mostly to giving information concerning small holdings and agriculture as an occupation for

* Not reproduced here.

those who can take up only small holdings. The reason is that officers who possess or acquire the necessary training, and *have capital* to the extent of (say) £1,000 or more, have before them the whole range of agriculture as practised in this country, and it would extend this booklet to undue length if an attempt were made to survey in detail the prospects open to men who are able to embark on farming on a fairly extensive scale. General information on this latter topic will, however, be found in a book issued by the Appointments Department of the Ministry of Labour entitled "A Record of Opportunity," which contains information also concerning the facilities for obtaining training and experience by those who do not need financial assistance from the Government for that purpose.

The English and Scottish Boards of Agriculture will be happy to give any advice necessary concerning methods of training and settlement, and to advise officers who wish to know how they should proceed to obtain training and take up land, even if they do not require direct Government assistance in money.

THE following Note has been communicated by Dr. Franklin Kidd and Dr Cyril West, of the Imperial College of Science and Technology :—

**Increased Yields as
the Result of
Swelling Seeds in
Water.**

Much interest has been aroused recently amongst agriculturists as to the possibility of obtaining increased yields from seeds which have been submitted to treatments in which soaking in water or in salt solutions plays a part. It therefore seems appropriate to draw attention to this subject.

Some 40 years ago two German agriculturists of repute, namely, C. Kraus³ and E. Wollny^{5 and 6}, showed that increased yields could be obtained by swelling seeds in water.

Their main conclusions may be summarised as follows :—

1. In order to obtain the best results the seeds must be swollen in the minimum amount of water necessary to saturate the seeds thoroughly. (If a large excess of water is used, the effect upon the subsequent growth and yield of the plants may be harmful.)
2. The time of immersion should be sufficiently long for the seeds to become fully swollen.
3. A subsequent redrying of the seed does not appreciably alter the beneficial effect of the treatment, but the redrying must not be carried out too rapidly.
4. The percentage of germination is liable to be slightly decreased by the treatment.
5. Swelling seeds in solutions of nutrient salts has much the same effect upon yield as swelling the seeds in pure water.
6. All the seeds tested (*i.e.*, the chief cereals, and various other annuals of economic importance) gave the same result, with the exception of winter rye.

As the published results obtained by these agriculturists are accessible at only one or two libraries in this country we may profitably record here a few of their figures.

TABLE I. (after Wollny).

Comparison of Yields from (i.) Seeds Swollen in Water and Sown in the Moist Condition, (ii.) Seeds Swollen and Redried before Sowing, and (iii.) Untreated Seeds.

The seeds were allowed to swell in the least possible amount of water necessary for complete saturation for 36 hours (the maize for 72 hours). The redrying process extended over 14 days, during which time the seeds were left exposed to the sun and air.

	Soaked ..	84	546 (—18%)	1214	27.5
Beans ..	Untreated ..	80	369	725	47.7
	Soaked ..	77	264 (—28%)	766	54.4

From a careful analysis of the growth of the plants at various stages of development, conclusions were drawn as

to the reason for the increased yields obtained. The plants from the treated seeds grew more quickly in the first few weeks, came into flower earlier, flowered for a longer period, and ripened off more slowly than the plants from the untreated seeds.

Schleh⁴ and Eberhart¹ have later claimed to have demonstrated that the swelling of seeds before sowing will increase the crop yield. The following table gives one set of results obtained by Eberhart in a field experiment with beans.

TABLE III. (after Eberhart).

* Mean of three experiments.

The work referred to above indicates that a definite increase in yield may be obtained by swelling the seed in water. It is clear that the water factor must be taken into account in the consideration of any process for increasing crop production which involves soaking the seed.

Elsewhere² the literature dealing with this water factor is critically reviewed, and also that dealing with the effect upon yield of the environmental conditions of the seed before harvesting, during storage, before sowing, and at the time of germination.

THE EARLY ELIMINATION OF SURPLUS COCKERELS.

R. C. PUNNETT, F.R.S., M.A.,

Professor of Genetics, Cambridge University.

THOSE who rear large numbers of pullets for egg-production are faced with the problem of the disposal of their cockerels to the best advantage, for, with many of the best egg-laying breeds, it is not possible to distinguish the sexes with certainty until the birds are several weeks old; and in some breeds such as Wyandottes and Rhode Island Reds the period is even longer than in the Mediterranean races. Under present conditions the rearing of young birds is expensive, especially during the earlier stages, nor is the rearing of cockerels in large numbers an economical source of flesh in view of the shortage of feeding stuffs. If, therefore, some way were found by which the sexes of the chicks could be distinguished with certainty at hatching, and the cockerels at once killed off, the cost of rearing the pullets necessary for egg-production would be materially reduced.

It does not appear to be generally known that, in some breeds, *provided that suitable matings are made*, the sexes of the chicks can be readily distinguished on hatching. This depends upon the fact that certain colours and patterns which are already betokened in the down are transmitted by the hen to her male offspring only. As an example may be taken the case of the Barred Plymouth Rock. Barred plumage is dominant to self-black; barred birds can throw blacks, but blacks bred together cannot give barred offspring. Now it is a peculiarity of the barred hen, no matter how bred or to what strain she belongs, to transmit the barred character to her male offspring

only. This can be readily observed by mating her with a self-black cock. In such a case all her sons are barred, but all her daughters are black. Chicks which will develop into barred birds can be distinguished in the down from those which become black. The latter have the down of a typical black breed, *i.e.*, they are full black except on the ventral surface, where they show a varying amount of white marking. The down colour of barred birds is, however, rather less intense as regards the black, while at the same time it shows a light patch at the back of the head, and frequently a lighter patch on either side of the rump (*cf.* Figure). The head patch is a certain guide and which may be relied upon to distinguish, at hatching, such birds as will become barred from those

Figure illustrating the difference in down colour between a chick that will grow into a bird with self-black plumage (on left) and one that will feather into a barred plumaged bird (on right). From the mating Barred Hen and Black Cock the former are all pullets, while the latter are cockerels.

that will develop into self-blacks. If, therefore, barred Plymouth Rock hens are run with black cocks the male offspring, which will all be barred, and will show the head spot in the down, can be separated from the females, which are all

black at hatching. By killing off the barred chicks the breeder need rear nothing but pullets, and so avoid the expense of raising a number of surplus cockerels.

But, of course, all the hens so produced are black, and cannot be used directly in matings to give barred cockerels and black pullets only. While this form of mating can be used to obtain the bulk of the pullets required for egg-production, the supply of barred hens for breeding must be maintained by means of one or more pens of the barred strains, according to the size of the establishment. In these, of course, it will not be possible to tell the sexes apart at hatching, and the cockerels must be reared to the stage at which sex manifests itself by other characteristics than the colour of the down. As, however, a relatively small proportion of the pullets bred for egg-production is subsequently used for breeding purposes, the method of eliminating surplus cockerels in the way outlined above should result in a very considerable saving of the expense now incurred through rearing large numbers of cockerels which are not required.

The provision of the few black cockerels offers no difficulty since blacks bred together give nothing but blacks. A single pen would provide all that were needed, and, as the pullets would naturally be reared for egg-production, there will be no wastage through killing.

The saving effected by taking advantage of the sex difference in down colour, where the dominant barred hen is mated with the self-black cock, may be illustrated by a numerical example. Let us suppose that the egg producer aims at rearing 1,000 laying pullets annually. In the ordinary way this means that 2,000 birds must be reared, since the sexes are produced in approximately equal numbers. Of the 1,000 cockerels the great bulk will be surplus birds, an unavoidable incubus on pullet production as present methods go. To produce these 2,000 chicks we may suppose that 50 hens are used as breeding stock, reckoning each hen to give 40 chicks (20 males and 20 females) during the hatching season.

On the method suggested above, these 2,000 birds will be produced from 50 barred hens run with a few black cockerels. The 1,000 male chicks, betrayed by their down colour, would be killed at hatching, and only the 1,000 black pullets reared for egg-laying. This entails the production of 50 barred hens annually for breeding. These should easily be reared from a single pen of pure barred birds, a cockerel and, say, four hens. The rearing of these 50 pullets would entail the rearing of a

corresponding 50 cockerels. The net result, however, would be the production of 1,050 pullets and 50 cockerels in place of 2,000 birds (1,000 of each sex) by the method at present in vogue. The breeding of the few black cockerels required for mating hardly enters into the question, since a single pair of blacks would give all that were wanted.

The case of the barred Rock has been given as a typical example, but the breeder who wishes to apply this method is not necessarily tied down to the use of this particular breed. The same type of inheritance is also exhibited in the characters of silver ground-colour as opposed to gold. Many breeds exist in which silver has its counterpart in gold—such examples are Silver and Gold-pencilled Hamburgs, Silver and Gold-laced Wyandottes, etc. In all of these cases silver behaves as a simple dominant to gold, and in all the silver hen transmits silver to her sons and gold to her daughters, just as the Plymouth Rock transmits barring to her sons and self-black to her daughters. Here, again, the colour of the bird is already betokened in the down. The down colours of the various gold and silver breeds show much variation. They may be pale with a few markings, as in the pencilled Hamburg, or much darker as in the laced breeds. Generally speaking, however, the silvers and golds are perfectly distinct in the down, and with very little practice they may be sorted out with certainty at the time of hatching. Such breeds may be used in the way outlined above, silver hens being, in this case, mated with a gold cock. The cocks from such pens will be all silver and the hens all gold. Apart from this difference the further procedure would be just as in the case of the Barred Rocks.

The silver-gold feature is also found in breeds where the predominant ground colour is neither silver nor gold. Silver-greys, such as Light Dorkings, behave towards Brown-reds, such as Brown Leghorns, in the same way that silvers behave towards golds. Mated with a brown cock the silver-grey hen gives chicks with two types of down, viz., the ordinary brown striped form and the silver grey form. In the former, the ground colour is yellowish buff and the stripes are a rich, warm brown; in the latter, the ground colour is paler and the brown stripes are distinctly lighter in shade. The brown-striped chicks are the pullets, the silver-greys the cockerels. Since striping in the down is dominant to some of the down colours of gold breeds, the difference between the sexes at hatching is equally well marked when a silver-grey hen is mated with a

cock of certain of the gold varieties. A cross well worthy of attention is that between silver-grey hens and a Rhode Island Red Cock.

Breeders of pullets for laying will probably raise the objection that the best egg-producing strains do not lend themselves to the system of mating suggested above. This is perfectly true in the case of some of the most popular breeds used for egg-production to-day. The method cannot be used for pure white or pure black races. Such breeds as White Leghorns, White Wyandottes, and Black Leghorns, must at present be ruled out. Nevertheless, there can be little doubt that if more attention were given to the breeds where the necessary sexual distinctions occur, strains could readily be evolved which would compare favourably with the best strains of egg-producers now in existence. There is no reason why the Gold and Silver Wyandottes should not be made as good as the Whites, and the work of the Maine Station in America has shown what can be done with the Barred Rock.

Moreover, the breeder is not entirely debarred from using certain of the perfected egg-producing varieties. Rhode Island Red cocks may be used for producing pullets either from hens of silver-greys or any of the silver breeds, *e.g.*, Silver-laced or Columbian Wyandottes. Barred Rock hens again may be mated with a Black Leghorn cockerel. This point is of considerable importance, for, as is now well known, the father is of greater influence than the mother in transmitting the quality of high egg-production to pullets. Provided that the Black Leghorn cockerel belonged to a first-class laying strain, it is likely that his daughters bred from the best Barred Rock hens would prove nearly, if not quite, as good layers as the pullets of his own pure strain.

The same would probably hold good for the first-class pullets bred from Columbian Wyandottes mated with a Rhode Island or a Brown Leghorn cock. Even if a slight decrease in the output of eggs had to be faced, and this is by no means certain until the point has been definitely tested, the breeder making use of the system outlined above would in all likelihood be more than compensated by being able to eliminate his cockerel chicks on hatching. At the same time, from the national as well as from the private standpoint, a considerable saving would be effected in high-grade foodstuffs at a time when these are scarce and difficult to procure.

The Food Problem.—With the gradual improvement in the prospect of food supplies, not only in increased supplies which may be looked for with the release of a larger proportion of millers' offals and the probability of imports of cattle feeding stuffs, but also in quality due to changes in milling, the outlook for poultry-keepers is more encouraging. Severe weather and consequent large demand for animal feeding stuffs may be expected for several months, and a return to pre-war conditions cannot be expected for a very long period. If the lessons of the War have been properly learnt there will be much to compensate the poultry-keeper for the difficult times through which he has passed.

It has been a revelation to many experienced feeders to find how productive a hen can be upon food which in the past has been regarded as of little value. Formerly far more concentrated foods were used; vegetables took little part in the rations served in many yards; a number of valuable by-products have been discovered and are now eagerly sought; and animal food, chiefly in the form of fish meal, is much more generally used. Grain feeding has also been reduced, necessarily, but with advantage, particularly so upon farms, where the quantity given has been more carefully regulated. If the farmer will only realise that the hen as well as the goose—though to a less extent—is a natural feeder, his poultry will give a better account of themselves. His errors have very largely consisted in overstocking the yard in the past and wrong methods of feeding.

Timber Shortage.—An increase in the numbers of poultry kept is to be anticipated, although this will, to a certain extent, be checked by the high cost of poultry houses, and any immediate improvement in this direction is hardly to be expected. This affects more particularly the ordinary farmer and the poultry farmer, since the small poultry-keeper in a sheltered garden overcomes the timber shortage if he is practical and handy. The heavy expense of portable poultry houses suitable for farmers is greatly to be regretted, since this method of keeping fowls is one to be fostered and encouraged in the interests of economical production. Better methods of housing have certainly found more advocates, with a realisation that for eggs all the year round, good shelter and cleanly surroundings are necessary and justifiable.

Prolific Laying Hens.—Probably the most noticeable improvement has been the raising of better-class stock. This has

undoubtedly received far more attention in recent years, the reputation of certain strains and breeds, and the evidence of good results obtained by individuals having spread in all directions. Without detracting in any way from the merits of these strains, it being very evident that great credit is due to the breeders in producing more prolific birds, it should be pointed out that good conditions are an essential factor in the increased prolificacy.

The Selection of Stock.—A further lesson which should lead to great economy if carried out in a practical manner is the recognition of the capacity for production by the hen in her 2nd, 3rd or even 4th year. For many years it has been the general recommendation to dispose of layers at the conclusion of their 2nd season, and there were many advocates of keeping the birds only one complete laying year. There can and should be no definite rule for all classes of poultry-keepers. With a large head of stock the rearing of big numbers of pullets each year is very costly, and although there are definite indications of improvements in the methods of rearing upon a large scale, the skilled poultryman can select hens worthy of retention and likely to result in a better profit. While some men possess the gift for selecting, long experience and familiarity with the birds and their habits are generally necessary to enable the selection to be made, there being no definite guide as a short cut for the novice.

The interest which is now being taken in what is known as the Hogan system of selection is likely to produce useful results, although much closer investigation is necessary before definite conclusions for general information can be arrived at. In the meantime there is danger of misleading the amateur by premature statements.

The retention of hens into their 2nd and 3rd seasons by the small, backyard poultry-keeper, whose birds are kept under intensive conditions, has less to recommend it, for under such conditions the birds are bound to lose vigour more rapidly, while the older birds are often spiteful to the pullets when kept together, and anything upsetting peaceful conditions has a distinct effect in retarding production. It is found a better plan with small flocks to keep hens and pullets in separate pens where possible.

Unity in the Interests of Increased Production.—The proposal for unity amongst the leading poultry societies should, if carried out, have useful results, and should it succeed in overcoming the difficulty caused by the conflicting interests

of the fancier and the utilitarian, a great step will have been made in the establishment of the industry. The whole question needs to be approached with a broad mind. No drastic measures are necessary, but a gradual drawing together of the two interests would eventually lead to great benefit to both sections. Although the membership of the clubs and societies is largely composed of specialist poultry-keepers, there is little doubt that, even if it were not to the individual interest of the members, recent experiences and difficulties occasioned by the War will lead them to take wider views in the national interests for increasing production.

The formation of local clubs, the revival of small shows, and the establishing of classes at these for the encouragement of the utility side, will do much in increasing production amongst farmers and small poultry-keepers—it is on these classes, in combination with the stimulus and assistance given to the industry by the specialist utility breeders, that increased production upon the most economical lines in the future depends.

It is a recognised fact in agriculture that it is necessary to sow oats early to obtain a good crop, the usual reasons given being that early-sown oats are much less liable to be damaged by early summer droughts, and, having a longer time available for growth, they yield more abundant grain. It has also been recognised that in districts where Frit Fly is a pest, early sowing will enable a crop to avoid a serious attack.

**Evidence of the
Value of Sowing
Oats Early to Avoid
Frit Attacks.**

As very little experimental evidence in support of the latter fact has ever been published, a short account of some preliminary experiments (part of a series of Frit Fly investigations undertaken by the Food Production Department) on the effect of late sowing as compared with moderately early sowing is of considerable interest.

The recently revised edition of Leaflet No. 202 on the Frit Fly* should be referred to for a full account of the nature of the damage to oats by this pest. It is only necessary to point out here that there are two main attacks on the oat plant, the first on the young plant—an attack which is often confused with “eelworm” damage—and the second on the grain in the ear.

* Copies may be obtained on application to the offices of the Board,
3, St. James's Square, London, S.W. 1.

This second attack on the grain is undoubtedly more widespread and serious than has been usually recognised. It is not uncommon to find 10 to 20 per cent. of the grain ruined by Frit attacks,* while cases where as much as 40 per cent. has been found to be destroyed are not unknown. Even in the past season, when Frit attacks on the young plants were conspicuously absent, there is reason to believe that the average loss of sound grain throughout the country was in the neighbourhood of 8 per cent.

In the experiments mentioned above, White "Abundance" and Black "Tartarian" oats were separately sown on one-half of a field at Long Sutton in Hampshire on 18th March, the other half being sown with similar oats on 25th April.

Attack on the Young Plant.—On 9th June, when the Frit attack on the young plants was very obvious, the infestation on the early-sown plots was found to be fairly heavy but chiefly confined to the lateral tillers. On the late-sown plots the infestation was very heavy, varying from 80 to 100 per cent. of the plants. On an average the number of plants infested by Frit Fly on the late-sown plots was about five times the number on the early-sown plots, and it was obvious that in the former many plants had been killed outright or so damaged that they would not produce ears.

The Attack on the Grain.—The results of an examination of samples of the grain collected at harvest may be tabulated as follows :—

White Abundance.					Black Tartarian.				
Sowing.	Grains exam'd.	Per cent. sound.	Per cent. fritted.	Per cent. sterile.	Sowing.	Grains exam'd.	Per cent. sound.	Per cent. fritted.	Per cent. sterile.
First ..	2,282	90	5.4	4.6	First ..	3,217	90.5	4.1	5.4
Second..	2,463	72.4	17.8	9.8	Second	2,879	72.4	16.7	11.0

In regard to this Table it may be explained that Frit attacks result either in an apparent failure of the grain to develop or in complete or partial destruction of the grain. Only such grains as exhibited undoubted signs of Frit damage (such as the presence of the empty puparium) were included under the heading "fritted." Doubtful cases where the grain was not developed, but where no obvious signs of Frit damage could be found, were included under the heading "sterile." The increase of these so-called "sterile" grains in the late-sown

* Investigations made independently by Mr. A. Roebuck, of the Harper Adams Agricultural College, Newport, Salop, confirm the truth of this statement.

oats, where undoubted "fritted" grains were more numerous, leads one to the conclusion that the increased "sterility" was also largely due to Frit. In any case the reduction of sound grain in the late-sown oats amounted to no less than about 18 per cent., while in addition the crop was obviously "thinner," due to the previously-mentioned destruction of the young plants. The total loss to the late-sown crop by Frit Fly due to the two attacks must have been not less than 30 per cent., or nearly one-third.

If, therefore, as these experiments have demonstrated, the early sowing of oats is not only a safeguard against a Frit attack on the young plants but also against the equally serious subsequent attack on the ripening grain, every effort should be made to have oats sown as early as the condition of the ground and the supply of labour will permit.

THE following brief notes, based on upwards of 10,000 tests conducted at the Official Seed Testing Station at the Food Production Department of the Board since 1st August last, are published with a view to giving growers some information as to the quality of the farm and garden seeds that will be available for the current season.

Cereals.—*Wheat.*—The average germination was good, being much above the standard (90 per cent.) specified in the Testing of Seeds Order. Twenty-five samples out of upwards of 3,000, however, germinated below 70 per cent., a large number of these being badly sprouted and in very poor condition. The most striking feature in connection with the wheat samples was the fact that 118, or nearly 4 per cent., contained Ear Cockles,* due to the earworm (*Tylenchus scandens*). The western counties and Wales would seem to have been chiefly affected, samples from Devon, Hereford, Wiltshire and Somerset most frequently containing Ear Cockles, whilst cockled samples were also received from Cornwall. Hampshire, Surrey, Kent and Sussex were southern counties, and Worcestershire, Shropshire, Northamptonshire and Oxfordshire, midland counties affected. Yorkshire, Lancashire and Derbyshire were the only northern counties from which samples containing Ear Cockles were received. One sample from Berkshire and one from Essex were also contaminated.

* See this *Journal*, October, 1918, p. 850.

Over 5 per cent. of the samples contained actual Bunts (due to the fungus *Tilletia tritici*)* and 9 samples contained Ergots (due to the fungus *Claviceps purpurea*).

Barley.—The great majority of the barley samples germinated above the standard (90 per cent.) ; 7 per cent., however, failed to reach a germination of 70 per cent.

Rye.—The average germination was good, comparatively few samples failing to reach 80 per cent. ; 4 per cent. of the samples, however, germinated less than 70 per cent. Slightly over 10 per cent. of the samples contained Ergots. The chief counties from which ergoted samples were received were Yorkshire, Lancashire and Monmouthshire.

Oats.—Most of the oat samples germinated considerably in excess of 85 per cent. About 1·5 per cent. germinated below 70 per cent. An appreciable proportion of the oats, however, was heated in the stack, or otherwise damaged, and several germinated less than 15 per cent.

It is evident from the foregoing facts that, although on the average the germination of cereals is good, considerable care should be exercised in the selection of seed, since it is usually impossible to determine with certainty by inspection whether grain has been rendered worthless for seed purposes as the result of weathering or heating. This applies with particular force to oats. Several apparently useful samples of seed oats have been rejected and used for feeding as the result of reports sent out from the Station.

Roots, Green Crops and Vegetables.—The average germination given by these seeds this and last season, and the standards of germination specified in the Testing of Seeds Order are set out in the Table on p. 1330. The percentage number of samples which have reached or exceeded the several standards, and the number of samples on which the average figures for this season are based, are also shown.

It will be noted that the germination of mangolds and peas is decidedly lower than last season, and that the germination of English peas in particular is very poor.

Beet, carrot, parsnip, and vetches or tares are all of decidedly higher quality than last season, and the evidence suggests that English-grown onions are also of higher quality. It should be realised that the standards of germination specified in the Testing of Seeds Order are not high, and consequently when

* It is proposed to make a microscopical examination of all the wheat samples for the spores of Bunt, and a detailed account of the incidence of this fungus will be given in the Annual Report. See Leaflet No. 92.

seeds below these standards are employed, growers would be well advised to have tests made before placing reliance on the seed. This applies in particular to samples of beans and peas, which frequently are not capable of growth in the soil in proportion to their capacity of germination. These seeds are, moreover, usually sown in proportion to the "plant" required, the rows not being subsequently thinned; it will be necessary, therefore, to add considerably to the seeding when inferior samples are employed.

Table to show the Quality of Roots, Green Crops, and Vegetables.

Kind of Seed.	Standard of Germination specified in the Testing of Seeds Order.	Percentage No. of Samples which have attained to or exceeded the Standard	Germination per cent.		No. of Samples upon which 1918-1919 Averages are based.
			Season 1918-19.	Season 1917-18.	
	Per cent.				
Mangold	120	69	130	138	80
Beet	100	80	120	84	117
Turnip (garden)	80	76 (over 85%)	89	84	116
" (field)	85				
Swede	85	67	87	80	100
Rape	85	63	88	90	11
Kohl Rabi (field and garden)	75	83	86	66	12
Field kale	75	82	85	71	11
Garden kale	75	83	79	71	24
Garden cabbage	75	65	78	73	200
Broccoli	75	62	78	—	73
Cauliflower	70	90	79	—	52
Brussels sprout	75	80	84	—	46
Poa (all samples)	75	74	77	86	370
English Pea	75	43	68	—	83
Field bean	—	—	99	97	80
Broad bean	80	93	95	93	45
Dwarf bean	80	79	87	63	48
Scarlet runner bean	65	81	82	80	70
Onion (all samples)	65	82	73	79	316
English onion	65	75	73	57*	24
Carrot	60	74	69	63	108
Parsnip	50	83	66	45	77
Vetch	90	74	92	78	183

* Four samples only.

The figures given in the Table indicate that in the case of the majority of species, the seed that will be available will germinate in excess of the standards. It should be realised, however, that as a rule dwarf French beans and scarlet runner beans do not germinate so well as broad beans, and that turnip, swede, rape and Brussels sprouts are likely to germinate better than cabbage, broccoli, garden kale and cauliflower.

Grasses and Clovers.—The subjoined Table gives the average germination of the grass and clover seeds tested this season compared with the figures obtained during 1917-1918. Particulars are also given as to the purity of the samples.

Table to show the Quality of Grasses and Clovers.

* Less than 1 per cent.

† 1 per cent. or under.

‡ Yellow suckling clover was included amongst the injurious weed seeds in 1917-1918, and it was excluded in 1918-1919, when the soft cranesbills were added.

It would appear from the above figures that the germination of grasses and clovers is likely to be better than last season. This is markedly so in the case of meadow fescue and cocksfoot, and would seem to be true also of alsike clover and trefoil. The quality of English red clovers is seen to be very similar to that of last year, and the standard of germination of these will in most cases again be low. The occurrence of dodder is as high as last year, and injurious weed seeds present above 1 per cent. are again plentiful in alsike and white clovers and in the rye-grasses; this season such weeds seem to be more than usually plentiful in meadow fescue. It is interesting to note that injurious weed seeds are this year more frequent in Italian than in perennial rye-grass.

It may be emphasised, in conclusion, that the samples so far tested indicate that special care should be exercised during the current season in the selection of seeds of the following plants in particular: oats, mangolds, cabbage, broccoli, peas, scarlet runner and dwarf French beans, English red clover,

trefoil, sainfoin, the rye-grasses (especially in regard to purity), alsike and white clover (especially in regard to purity).

Farmers, allotment holders and others desiring to send seeds to the Station to be tested should comply with the following regulations :—

1. *The Weight of Seed sent must be as follows :—*Broad beans and scarlet runner beans, 8 oz. ; peas and dwarf French beans, 6 oz. ; wheat, barley, oats, rye, vetches, red clover, crimson clover, trefoil, lucerne, and sainfoin, 4 oz. ; all grasses, alsike clover, white clover, all roots, beet and mangold, 2 oz. ; all vegetable seeds other than beet and mangold, $\frac{1}{2}$ oz.

2. *Fees must be sent at the same time as the Sample.*—The fees are as follows : (a) In the case of tests which a farmer requires for his own information only, 3d. per sample ; (b) in the case of tests needed for the purpose of a declaration for sale, 1s. per sample for cereals, 1s. 6d. per sample for roots, vegetables and vetches, and 2s. per sample for grasses, clovers, mangolds and beet. Postage need not be prepaid when packages are properly addressed and sent by letter post.

3. Packages should be addressed to *The Director-General, Food Production Department, 72, Victoria Street, London, S.W. 1*, and marked "*Seed Testing Station*" in the left-hand top corner of the envelope.

4. Special envelopes may be obtained free of cost on application to the above address.

THE USE OF AMMONIUM NITRATE AS A FERTILISER.

E. J. RUSSELL, F.R.S., D.Sc.,

Director of the Rothamsted Experimental Station.

THE cessation of hostilities has enabled the Ministry of Munitions to liberate large quantities of ammonium nitrate for purposes of agriculture, and as this possibility had been foreseen for some time the Rothamsted Experimental Station has been engaged in field trials and other investigations to discover what value the material possessed as a fertiliser. These experiments form part of the campaign organised at

the Food Production Department to seek new sources of manures and to remedy as far as possible the shortage created by war conditions. The material was placed at the disposal of the Station by the Ministry of Munitions.

The experiments were made on potatoes, mangolds and wheat. The results were successful, and show that ammonium nitrate is a very useful fertiliser. For mangolds it was more effective than sulphate of ammonia when reckoned on an equal nitrogen basis, probably because part of its nitrogen is already in the form of nitrate; for wheat it is equally effective. For potatoes, however, it is more risky than sulphate of ammonia: it gave as large a crop, but induced the formation of a large growth of haulm which might easily have been a disadvantage had there been much blight.

Ammonium Nitrate is Concentrated.—Ammonium nitrate is by far the most concentrated nitrogenous fertiliser on the market. When pure it contains 35 per cent. of nitrogen, equivalent to $42\frac{1}{2}$ per cent. of ammonia. Half of the nitrogen is in the form of nitrate which is immediately available for the needs of the crop, and the other half in the form of ammonia which comes into action somewhat later. Samples examined at Rothamsted have been about 96 per cent. pure, the remainder being mainly moisture: in this case the nitrogen content is $33\frac{1}{2}$ per cent. Sulphate of ammonia contains 20 per cent. and nitrate of soda 15 per cent. If sulphate of ammonia is obtainable at £16 15s. per ton and nitrate of soda at £20 per ton, then nitrate of ammonia on the same scale is worth £37 5s. per ton. Its richness in nitrogen renders it especially valuable in horticultural and market-garden work. Further, as it is already in the form of nitrate it has no exhausting effect on the lime in the soil, so that it can be used where lime is rather short, and where, therefore, there may be some fear that sulphate of ammonia would not be wholly suitable. It is also entirely suitable for general farm crops and is perhaps the quickest-acting top-dressing known, being even more soluble than sodium nitrate, and, at the same time, as part of its nitrogen is in the form of ammonia, it is not so liable to loss if wet weather sets in after it has been applied to the soil.

Absorption of Moisture.—Like some other very soluble substances, ammonium nitrate is liable to attract moisture from the air, and some samples become unmanageable because they form a tough cake which cannot easily be broken and may become pasty. There are, however, several varieties or

modifications of ammonium nitrate, and one of them is free from this objectionable property. It will be necessary for the dealers to ensure that they purchase only the "non-deliquescent" variety, and in case of any uncertainty to communicate with the Food Production Department, who can go into the question with the proper persons. This "non-deliquescent" variety keeps quite well in a dry shed: some of it has been stored in the manure shed at the Rothamsted farm, with the lid of the cask open, for the past ten months without becoming in the least unmanageable. A slight cake had formed on the surface, but it was easily powdered, and the crystals below were in good condition for drilling.

Use in Mixtures.—The proper use of ammonium nitrate is as a top-dressing, and hence it would generally be applied alone. It mixes quite well with superphosphate, and the mixture is easily drilled. The mixture, however, should not be kept, as it may cause trouble, and in any case the superphosphate must be dry and in good condition as supplied by a first-class maker. A damp superphosphate containing acid should never be mixed with ammonium nitrate, nor should dissolved bones: in these cases brown fumes are likely to be given off, which may have serious or even fatal effects on persons standing near.

Scorching of Follage.—Owing to its high solubility, ammonium nitrate is liable to scorch the young leaves of plants. A crop of mangolds was injured in this way in 1914 at Rothamsted: the small crystals falling on the leaves yielded so strong a solution that the plant suffered considerably. In the past season the material was applied in a fine interval during showery weather, with the result that it was speedily washed off the leaves and caused no damage at any time. In experiments in the north no bad effects were observed. This point requires attention from the farmer, but with reasonable care the difficulty about scorching is easily overcome.

Inflammability of Storage Casks, etc.—It is necessary to warn farmers and merchants that bags, casks, etc., soaked in ammonium nitrate become very inflammable and must be kept away from fire. Although ammonium nitrate will not itself burn, it greatly helps anything that is already alight: once a fire started in a store where any large amount was present the effects would be disastrous.

Possible Poisonous Effects.—Some of the ammonium nitrate that will become available has been mixed with T.N.T., and,

although this substance has been separated, a little may yet remain behind. So long as less than 1 per cent. is present no harm need be feared: there might, however, be trouble if larger amounts were present, as T.N.T. is poisonous to plants. One sample contained as much as 3 per cent. and yet gave no trouble.

Results of Experiments.—The general results of the Rothamsted experiments may be summarised as follows:—

1. Ammonium nitrate is an excellent fertiliser, the nitrogen of which is worth as much as that in nitrate of soda and sulphate of ammonia. At present prices of these two fertilisers ammonium nitrate would, on the same basis, be worth £37 5s. per ton.

2. It contains more than twice as much nitrogen as nitrate of soda, and one and three-quarters times as much as sulphate of ammonia: it is thus the most concentrated nitrogen fertiliser obtainable on the large scale. Where 1 cwt. of nitrate of soda or $\frac{3}{4}$ cwt. of sulphate of ammonia is ordinarily used, less than $\frac{1}{2}$ cwt. of nitrate of ammonia would be required.

3. It can be applied to any crop for which nitrate of soda is suitable, but it is not superior to sulphate of ammonia for potatoes, and may be inferior. Its proper use is as a top-dressing, and not as a constituent in mixed manures.

4. Farmers must insist on having the “non-deliquescent” variety, otherwise they will certainly be inviting trouble.

5. While the material itself is not inflammable, it yet helps a fire considerably. Great care is, therefore, necessary not to store under conditions where a fire might be started.

The details of the Rothamsted field experiments are set out below.

Experiment on Mangolds.—This experiment was carried out in Stackyard Field: the variety grown was Sutton’s “Yellow Globe.” Seed was sown on 29th May, 1918: there were six plots, each of $\frac{1}{20}$ acre.

In December, 1917, all the plots had received dung at the rate of 10 tons per acre. At the time of drilling they all received superphosphate at the rate of 4 cwt. per acre, and salt

and sulphate of ammonia at the rate of 2 cwt. per acre. Two received no further dressing; two received nitrate of ammonia at the rate of 145 lb. per acre—this containing the same amount of nitrogen as was present in the sulphate of ammonia applied on the two remaining plots.

There is always a certain amount of irregularity of plant growth in mangold experiments; the additional care involved in the applications of weighed quantities of manure necessitates walking on the plots, which is not good for the crop. The roots were pulled and weighed on 9th December, 1918: the results are as follows:—

Stackyard Field: Mangolds, 1918.

Seed sown 29th May; Roots carted 9th to 12th December.

Manure.	Weight of Mangolds.	
	Per Plot ($\frac{1}{10}$ Acre).	Per Acre (Mean of Two Plots).
	Cwt. qr. lb.	Tons.
Superphosphate, salt, and sulphate of ammonia	19 1 8	18·6
Superphosphate, salt, and nitrate of ammonia	17 3 20	
Superphosphate, salt, and nitrate of ammonia	20 2 20	23·3
Superphosphate, salt, and nitrate of ammonia	25 3 18	
Superphosphate and salt	16 2 20	17·3
Superphosphate and salt	17 3 16	

Manuring:—

All plots received a dressing of dung at the rate of 10 tons to the acre.

The other manures at the rate of—

Superphosphate 4 cwt. per acre.

Salt 2 „ „

Sulphate of ammonia .. 2 „ „

Nitrate of ammonia .. 145 lb. „ (equivalent to 2 cwt. sulphate of ammonia).

The ammonium nitrate is clearly superior to the ammonium sulphate.

Experiments with Potatoes in West Barn Field.—The manuring was done in the same way as for mangolds, except that no salt was used: a dressing of dung was applied over the whole area at the rate of 10 tons per acre in December, 1917, and was shortly afterwards ploughed in. Superphosphate at the rate of 4 cwt. per acre was applied with the seed. To two of the plots sulphate of ammonia was given at the rate of 2 cwt. per acre, and to two others ammonium nitrate at the rate of 145 lb. per acre—these again containing the same amounts of nitrogen.

The variety of potatoes was "Arran Chief"; they were planted on 9th May, there being 27 rows in each plot of $\frac{1}{20}$ acre. Of the seven plots one was spoilt as the tubers were attacked by rats: the weights for the remaining six were as follows:—

West Barnfield: Potatoes 1918.

Variety "Arran Chief," planted 9th May; 27 rows in each plot of $\frac{1}{20}$ acre.

Plot.	Manure.	Tubers roughly cleaned.	
		Weight per Acre.	Mean per Acre.
9	Superphosphate and sulphate of ammonia	Cwt. 175·4	Cwt. 175·4
11	Superphosphate and nitrate of ammonia	178·9	174·5
14		170·0	
13	Superphosphate alone	146·8	160·9
10		175·0	
15	No artificials	144·3	144·3

A dressing of dung was applied over the whole field in the winter, and ploughed 10th December to 3rd January.

Rates per acre of artificial manures:—

Superphosphate	4 cwt.
Sulphate of ammonia	2 "
Nitrate of ammonia	145 lb.

The ammonium nitrate led to the production of very large haulms which might have been troublesome had there been much blight; fortunately there was not. The plots with superphosphate alone are irregular, but less than the figures indicate. Plot 10 contained a good many diseased tubers which were weighed in with the total: the actual saleable material was not much more than on Plot 13. On the whole the figures show no superiority over sulphate of ammonia for potatoes, and in view of the rank growth of haulm we consider it more risky.

Experiments with Wheat.—The variety grown was "Red Standard," and it was taken after clover. It was sown on 3rd to 5th November, 1917, and cut on 13th to 15th August, 1918. Two sets of plots were arranged at opposite ends of the field: they are therefore to be regarded as distinct experiments and not as duplicates. The actual yields differed, but the conclusions are the same in both cases. Ammonium nitrate turns out fully equal to ammonium sulphate.

Little Hoos Field ; Wheat, 1918.

Variety.—"Red Standard" (after clover).

Seed sown.—3rd to 5th November, 1917.

Crop cut.—12th and 13th August, 1918.

Artificial Manures applied, 26th April, 1918¹ (by hand) consisting of—
2 cwt. superphosphate per acre.

1 " sulphate of ammonia per acre, or These contain equal
72½ lb. nitrate of ammonia per acre. quantities of nitrogen.

	Dressed Grain per Acre.		Straw per Acre.	Total Produce per Acre.
<i>Experiment I.</i>	lb.	bush.	lb.	lb.
Unmanured	2,195	33·9	4,030	6,443
Superphosphate only	2,492	38·6	4,550	7,310
Sulphate of ammonia and super- phosphate	2,630	41·3	5,250	8,178
Nitrate of ammonia and super- phosphate	2,822	44·7	5,070	8,120
<i>Experiment II.</i>				
Unmanured	2,325	35·8	4,450	7,057
Superphosphate only	2,198	34·6	4,520	7,025
Sulphate of ammonia and super- phosphate	2,585	40·1	4,830	7,775
Nitrate of ammonia and super- phosphate	2,400	37·7	5,050	7,830

Experiments at other Centres.—Similar results to those just described have been obtained in Aberdeen by Hendrick. They are recorded in the *Journal of the Society of Chemical Industry* for 1918 (Vol. 37, p. 146). In these experiments ammonium nitrate appeared to be better even than nitrate of soda. Moreover, as in the Rothamsted experiments with man-golds, the ammonium nitrate gave better yields than ammonium sulphate containing equal amounts of nitrogen. Most of the tests were made on the hay crop: the results of twelve experiments carried out between 1911 and 1914 were:—

Plot.	Cwt. of Hay per Acre. .		
	1911-1914. General Average.	1913. 3 Centres.	1914. 3 Centres.
1. No manure	42·4	49·8	49·6
2. Superphosphate and potash salts only	50·2	65·7	58·4
3. As Plot 2 plus nitrate of soda ..	53·8	69·2	57·8
4. As Plot 2 plus sulphate of ammonia	—	68·0	57·8
5. As Plot 2 plus nitrate of ammonia	56·2	69·7	59·9

Similar results were obtained with oats in 1911 and 1914 :—

Plot.	Lb. of Grain per Acre.	
	1911.	1914.
1. No manure	2,307	1,813
2. Superphosphate and potash salts only ..	2,477	1,853
3. As Plot 2 plus nitrate of soda	2,644	2,280
4. As Plot 2 plus sulphate of ammonia ..	—	1,893
5. As Plot 2 plus nitrate of ammonia	2,787	2,427

The ammonium nitrate was probably not the "non-deliquescent" variety: Hendrick states that it rapidly became damp and liquefied on exposure to air. As already mentioned this difficulty can be largely overcome.

Two experiments made at Newton Rigg with mangolds in the years 1913 and 1914 may be mentioned. In neither case, however, was the result as good as that with nitrate of soda :—

	Yield per acre.	
	1913. Tons.	1914. Tons.
Nitrate of soda	20½	23½
Nitrate of ammonia	14½	21½

**Notes on Manures
for March :
From the
Rothamsted Experi-
mental Station.**

PERHAPS the most important matter requiring attention at the present time is the application of top-dressings to winter corn. The autumn and winter months were wetter than usual, the rainfall at Rothamsted being :—

	Sept.	Oct.	Nov.	Dec.	Jan.	Total in Five Months.	Excess in 1918-19.
For 1918 and 1919 ..	5.42	1.96	2.67	3.18	4.11	17.34	4.4 in.
Average for 60 years ..	2.37	3.18	2.58	2.47	2.34	12.94	

Not only was there more rain, but also the number of wet days was greater than usual :—

	Sept.	Oct.	Nov.	Dec.	Jan.	Total in Five Months.	Excess in 1918-19.
For 1918 and 1919 ..	24	15	17	26	25	107	27 days
Average for 60 years ..	13	18	16	17	16	80	

The effect of this excess is to wash out valuable nitrates, without which large crops cannot be grown, and the situation

has to be met by applying nitrates or the next best substitute—sulphate of ammonia, or, if unobtainable, nitrate of ammonia.

The actual loss of nitrate depends on many circumstances, such as previous cropping, nature of soil, amount of rainfall, etc., but one would probably not be far out in putting it at the equivalent of $\frac{3}{4}$ –1 cwt. of sulphate of ammonia. At any rate a dressing of this size has a useful effect in increasing the yield both of grain and of straw. Many examples might be quoted: the following from recent threshing results show the increases that were obtained with the wheat crop last season at Rothamsted:—

<i>Yield of Wheat.</i>	<i>No Spring Dressing.</i>	<i>Super-phosphate only.</i>	<i>Super-phosphate + 1 cwt. Sulphate of Ammonia.</i>
Grain, bush. per acre, I. ..	33.9	38.6	41.3
II. ..	35.8	34.6	40.1
Straw, lb. per acre, I. ..	4,010	4,550	5,250
II. ..	4,450	4,520	4,830

I. and II. represent separate experiments at opposite ends of the field, but both agree in showing profitable increase from the application of the spring dressing.

The preceding crop had been clover, and many farmers would have thought that nothing more would be wanted for the wheat in spring. On this land, which is only second-rate, the 33.9 and 35.8 bush. obtained on the unmanured plots represent distinctly good yields, the result of the previous clover. These yields, however, are increased to above 40 bush. by the use of the spring dressing, and there is a corresponding increase in the straw. The crop stood up perfectly well and showed not the smallest tendency to go down. In this case the dressing was applied on 26th April, 1918; it could, however, quite well, and indeed preferably, have gone on earlier. Whilst one would not apply a spring dressing while the ground is frozen, it can be put on as soon after frost as the land will bear the horses. Any time after the middle of February is suitable.

If soot is obtainable it can be used instead of sulphate of ammonia, over which, indeed, it has some advantages, notably that it helps to warm the land and to keep off slugs and certain other pests. Twenty bush. of soot would be about equal in nitrogen value to 1 cwt. sulphate of ammonia, so that if sulphate of ammonia is obtainable at 16s. 9d. per cwt., soot is worth something more than 10d. per bush. But it must be good light household soot, and not furnace soot, destructor dust,

or the black material sometimes offered. Unfortunately this year's supplies are likely to be less than usual, owing to limitations of coal combustion.

The addition of superphosphate is advisable to help the young plants make an early start in spring and to hasten the ripening in autumn. The heavy rain of this winter has made this course additionally desirable.

A correspondent has recently asked whether superphosphate might be mixed with nitrate of soda to make a top-dressing or whether it is essential to apply the two fertilisers separately. The answer is that these two fertilisers can be mixed provided the superphosphate is dry and *the mixture is applied at once. The mixture should not be stored, and it should not be made if the superphosphate is damp.* In such cases red fumes may be evolved, which are exceedingly irritating, and in extreme cases poisonous. Dissolved bones should not be mixed with nitrate of soda.

Lime in Pastures.—This is the time for applying lime to pastures, and in cases where this course is known to be desirable it should be adopted as soon as possible. Trials should, however, always be made to ascertain whether lime or basic slag will give the better result. Cockle Park affords an instance of a poor pasture on heavy clay soil, which at first sight would be expected to respond to lime. It does so, but it gives a much better return for slag.

	Live-weight Increase of Sheep over Unmanured Plot. Lb. per acre.	Yield when Cut for Hay. Cwt. per acre.
No manure	—	8½
Lime 4 tons per acre, 1897 and 1903	12½	12½
Basic slag, 10 cwt. per acre, 1897 ..	79½	2½

Clover Mixtures.—In view of the great importance of clover in the rotation it is imperative to take all possible steps to secure a good crop. Where red clover is grown alone there is liability to failure through clover sickness, especially when the preceding clover crop had shown signs of failing. The recommendation has recently been made that a mixture should, therefore, be grown. Mr. Arthur Amos of Cambridge, however, points out that alsike is very susceptible to eelworm and to the fungus *Sclerotinia*, both of which may cause sickness. On the other hand, sainfoin is immune, and trefoil, lucerne and white clover are practically immune, to the eelworm disease; these crops could, therefore, be grown where eelworm has caused trouble. The suitability of components of a mixture is not,

of course, a fertiliser question, but a proper mixture may make a considerable difference to the effectiveness of manures.

Town Wastes and Refuse as Manures.—The campaign against national waste has led to the examination of the possibility of converting town waste into manure. Unfortunately, in spite of its unpleasantness, the material is not very good, and could only be purchased at a low price. The following is a recent sample :—

Nitrogen	1.22	per cent.
Ammoniacal nitrogen	0.52	„ „
Phosphoric acid (P_2O_5)	0.30	„ „
Potash (K_2O)	0.80	„ „

This material is richer than some of the samples examined owing to the incorporation of a certain amount of soot, but it was still too low in grade to come into general use. Of course, farmers having easy communication with dumps of town refuse may advantageously use it, especially if they are farming heavy land, but they must not make any extravagant anticipations and should carefully go into the question of cost.

Dissolved Bones.—In the Fertiliser Notes for January December issue of this *Journal*)* some instances are given of tests of dissolved bones against superphosphate which show no advantage in the bones in spite of their high price, and farmers are, therefore, urged to consider whether they are really worth buying. A correspondent who claims to an extensive trade in dissolved bones states that the preference for them shown by his clients “is not based simply on the actual crops obtained from the fertiliser. Pure dissolved bones act as a fertiliser and, in addition to this, keep the soil in excellent tilth, and by comparing soils where the two manures (dissolved bones and superphosphate) have been largely used for years the difference is very distinctly to be seen.” Further, he states that superphosphate gives a bad tilth.

If any farmer or grower has a field on which superphosphate gives a bad tilth and dissolved bones a good one, the Director of the Rothamsted Experimental Station would like an opportunity of seeing the two tilths, as, in spite of careful inquiry, he has never yet been able to find a case where dissolved bones are superior to superphosphate and the equivalent amount of ammonia.

* See p. 1105.

THE PRODUCTION OF GROUND CHALK.

B. H. BEDELL.

THE falling off in lime supplies, owing to lime burners and lime getters having been called up, induced the Food Production Department to encourage the production of ground chalk for agricultural use, and towards the end of 1917 the Department installed an experimental plant at the quarries of Messrs. Hall & Co., Ltd., at Coulsdon, Surrey.

This plant has been erected close to the working face, and the lump chalk is wheeled directly on to a drying floor where it is spread about a foot thick. When it is dry enough to grind it is wheeled to the feeding-mouth of the grinding mill, which is on a level with the drying floor and within a few feet of it. The mill, which can crush up to 6 tons per hour, is in a chamber excavated below ground level. This chamber also contains the electric motor, from which power for the whole of the plant is derived. The chalk after being powdered in the mill falls to a still lower chamber excavated beneath the first, and here it is picked up by a chain and bucket elevator and taken to the top of the building, whence it gravitates down chutes either directly into railway wagons or into a storage bin or is bagged. All these operations take place in covered buildings, although in some places, as for instance the drying shed, no side walls are provided, since a free play of air is manifestly to be desired.

The plant has an output of between 150 and 200 tons per week, 5 men being employed. Almost all the finished product is sent away loose in bulk in truck, a small proportion only being bagged when specially ordered. The price charged at present is 15s. per ton, but it is possible that the ground chalk can be produced at 12s. 6d. per ton or less under favourable conditions as regards labour and fuel.

The following notes based on the experience gained in the construction and use of this plant are intended for the guidance of persons proposing to erect plant for crushing chalk.

Mills of the disintegrator or beater type with swinging hammers have proved quite suitable for the work. The highest mechanical efficiency is attained with only two (instead of four) beaters in use. The screen bars when set with $\frac{1}{2}$ -in. spaces between them yield a satisfactory product and will allow chalk containing as much as 18 per cent. of water to pass through without clogging the mill. When working at full output on chalk containing about 10 per cent. of water it was

found that the energy consumption averaged 5 B.T.U. input to motor per ton-hour output, which would be about 5.5 H.P. on the shaft of the disintegrator. These figures were derived from a mill capable of 6 tons per hour output.

The comparatively large percentage of water contained in the chalk as it is passed through the mill has caused a complete absence of the dust troubles usually associated with this kind of plant.

The chalk at Coulsdon contains up to 30 per cent. of water as it is quarried; it is therefore quite impossible to take it straight from the working face to the mill, since even if it would pass through—which it will not—the resulting product would be a sticky mass, quite useless for distribution.

Various plans for drying the damp chalk were considered, and after inspecting various analogous installations it was decided both on grounds of first cost and fuel consumption that some type of drying floor should be employed, rather than any of the rotary driers which can be obtained for this class of work.

The difficulties connected with obtaining large quantities of thick steel or cast-iron plates for the floor in war time led to an investigation into the possibility of using a reinforced concrete floor. Contrary to all preconceptions on the point, calculations based on the known thermal conductivity of concrete* showed that a thoroughly efficient floor could be built of that substance, and that by slightly increasing the area beyond that which would be considered sufficient for an iron floor, an equal efficiency (tons of chalk dried : cwt. of coal burnt) could be attained.

A reinforced floor 3 in. thick was built and has completely confirmed the theory, for it is found that working right through the season the fuel consumption has been only 0.75 cwt. of gas coke per ton of chalk dried, the drying consisting in an average reduction of moisture from 27 to 10 per cent.

This result is not quite so surprising when it is remembered that the chalk (which on account of the cost of handling cannot be spread much less than 12 in. thick on the floor) is itself a very good heat insulator, particularly so when dry, and that on this account, no matter of what material the actual floor is made, the heat which reaches the upper 6 in. of the drying chalk has had to pass through 6 in. of one of the best non-

* The thermal conductivity of an average concrete is such that with a floor 3 in. thick 5 B.Th.U. per hour will pass through it per ft. super. per degree C. of difference of temperature on the two sides.

conductors of heat. Hence it follows that, as the concrete is a much better heat conductor than chalk, almost the whole "thermal drop" will be across the bed of drying chalk. Actual measurements of temperatures gave the following results:—Thermal drop across floor $15^{\circ}\text{C}.$, across chalk $186^{\circ}\text{C}.$ Since therefore a slight increase of area of the floor will entirely compensate for the lack of conductivity of the concrete, and concrete forms such a much better surface for shovelling than warped steel plates (plates on drying floors always warp after being in use for a short time) it follows that concrete is the better material to use. Care must be taken that fire-resisting material (firebrick or lumps) is used to cover the furnace and flues for a sufficient distance to enable the temperature of the hot gases to fall to about $600^{\circ}\text{C}.$, so as not to dehydrate the cement. A suitable ratio of grate area to floor surface has been found to be 1 : 30 ; with this ratio about 1 ton of chalk per diem for every 40 sq. ft. of floor area can be dried with an expenditure of 0.75 cwt. of coke. The fires should be thick and slow ; a stack 20 ft. high gives ample draught, and even then a damper should be provided to regulate the rate of combustion. It is sufficient to allow a chimney to fire-grate area of 1 : 10.

The product turned out by such a plant as that at Coulsdon is of medium coarseness, about 40 per cent. of it passing a 200×200 screen. The fact that the larger particles are not immediately available for neutralising soil acidity, but become so after one or two seasons exposure in the ground, is possibly no disadvantage, since there is always a large proportion of very finely-divided chalk present which is immediately available.

THE Committee of Section IV. of the Advisory Council of the Ministry of Reconstruction was appointed by the Minister of Reconstruction in March, 1918, the terms of reference being "to consider the steps and conditions, apart from the provision of Farm and Small Holding Colonies, necessary to attract to employment on the land all returning sailors and soldiers who may wish to take up country life, and particularly to induce them to do so in sufficient numbers to secure the maximum output from the land." A report has recently been issued

**Report of Committee
on the Employment
on the Land of
Returned Sailors
and Soldiers.**

giving the Committee's recommendations relating to England and Wales. These recommendations are summarised as follows :—

1. That an executive committee should be set up to ascertain the numbers of ex-service men desiring to settle on the land, and to deal with their training and the placing of them in employment.

Housing.—2. That (subject to certain reservations) the State should adopt the housing policy outlined in the memorandum submitted to the President of the Local Government Board on 6th August, 1918.

3. That as a temporary expedient the proposed executive committee should examine into the possibility of meeting the immediate housing requirements by the use of military hutments or otherwise.

Acquisition of Land.—4. That a special sanctioning authority should be appointed, as recommended in the report of the committee on the acquisition and valuation of land.

5. That for providing small holdings the county councils should be the sole authority.

6. That county councils should be empowered to acquire land which can be leased to parish councils for the purpose of allotments.

7. That the county councils should be the rural housing authority and as such acquire the necessary land.

8. That land needed for village halls and recreation grounds should be acquired through the county councils, but that the parish councils (or 5 per cent. of the local government voters) should have a right of appeal to the Board of Agriculture to take action where the county council has refused to act.

Small Holdings.—9. That the financial restrictions at present imposed by the Treasury should be removed.

10. That county councils should be enabled to deal with the existing unsatisfied demand for small holdings, and should be encouraged to obtain suitable land in advance of the demands actually made upon them.

11. That the Small Holdings Committee of the county council should be given a statutory position analogous to that of the County Education Committee, and should include representatives of the small-holding class.

12. That a county council should be allowed to treat its total liabilities in the provision of small holdings as a single account, and that the State should make a grant of 40 per cent. of the actual cost of equipping small holdings for ex-service men.

13. That in regard to stocking a holding the State, where necessary, should lend the working capital, but that the services of the agricultural co-operative societies should be utilised wherever possible.

14. That the Small Holdings and Allotments Act, 1908, should be amended in the following particulars :—

(a) Powers of improvement.

(b) Sixty years allowed for loans on buildings.

(c) Exemption from local by-laws.

(d) Removal of restriction against compulsory acquisition of a holding of 50 acres or less.

(e) Power to acquire land to be sub-let by parish councils as allotments.

15. That a small holder who is tenant of a county council should not be called upon to contribute in his rent to a sinking fund in respect of the purchase price of the land.

16. That, subject to adequate safeguards, a small holder should have the option of buying his holding outright, and that the total cost of land and equipment should be advanced to him on the basis of annual repayments including sinking fund and interest.

17. That men without practical experience should be encouraged in the first instance to work as wage earners.

Training.—18. That for those who intend to become large farmers, farm managers, organisers, or experts, the training should include a course at an agricultural college as well as on a farm, the complete period of training being usually for a period of two years, and that studentships should be provided by the State for suitable persons.

19. That steps should be taken to increase the accommodation, staff, and number of agricultural colleges.

20. That, in connection with training in forestry, the proposed executive committee should refer to the interim forestry authority, and that the forestry authority should get into touch with the local pensions committees who have already initiated schemes.

21. That intending small holders who cannot be accommodated in a small-holding colony should, in the first instance, work as labourers on some well-managed small holding or suitable farm.

Wages and Employment.—22. That an ex-service man taking up work as a farm labourer without previous experience should receive not less than the full local rate of wages, but that the State should, in such a case, for a limited period and by way of premium, contribute towards the difference between the man's economic value and the local rate of wages; and that a similar system should apply in the case of those who are so working with a view to becoming small holders.

23. That a list of suitable farmers who would employ men on the above terms should be prepared.

Trade Organisation.—24. That special attention should be given to instruction in book-keeping and cost accounting.

25. That the principle of co-operation in agriculture should be extended on the lines recommended by the Agricultural Policy Sub-Committee.

26. That improvement in transport facilities should be included in the programme of the State's agricultural policy.

27. That an experiment should be made in the institution of rural information offices.

28. That the State should encourage the provision of agricultural credit facilities on the lines adopted by the Agricultural Organisation Society.*

Village Life.—29. That an organised effort should be made, as recommended by the Agricultural Policy Sub-Committee, to improve the conditions of village life, and that the State should have a definite policy on the subject, should, if necessary, appoint commissioners to supervise the carrying out of that policy through the local authorities and voluntary organisations, and should be responsible for the extra financial burden attributable to war prices.

30. That the policy adopted should include the establishment of village clubs and village halls, recreation grounds, and improved

* See this *Journal*, December, 1918, p. 1078.

passenger transport, and the provision of good gardens and allotments, common pasture, and electrical facilities, and the general encouragement of rural industries.

31. That, if necessary, grants should be made by the State to the Village Clubs Association and the Women's Institute movement for the express purpose of providing local machinery which can give effect to the powers possessed by local authorities, in addition to the grants to the county councils for providing technical instruction and to the Agricultural Organisation Society for organising supply and disposal.

Voluntary Effort and Private Enterprises.—32. That voluntary organisations should, if necessary, be registered and be subject to audit and inspection by the State, but that the State should recognise that the primary duty in connection with village reconstruction must lie with itself.

By a series of Orders issued between May and November, 1917, the Food Controller made certain provisions regulating the sale of meat by wholesale and retail and prescribing maximum wholesale prices for carcasses and, in some parts of the country, for various cuts of meat usually sold by wholesale. Power was also given to Food Control Committees to prescribe schedules of maximum retail prices which were not to be exceeded by butchers in their district, and it was further provided that in no case was a butcher to charge the consumer a higher price than that represented by a certain percentage over and above the prescribed wholesale maximum prices. No control was, at that time, placed upon the prices which might be charged by farmers or paid by wholesale or retail butchers for live cattle and sheep, and every trader was allowed to buy live stock at any place and at any price and up to any amount.

"Per Head" Charges on Cattle and Sheep: Regulation from the Farm to the Nation's Dinner-table.

Inequality of Distribution.—In these circumstances retailers who had been in the habit of buying live stock, being anxious to maintain or increase their turnover, were paying, and the farmers were accepting, prices for live stock quite out of proportion to the prices at which the butchers were compelled to sell the meat. Wholesalers, compelled to supply dead meat at maximum prices, were also buying in a competitive market, which involved a loss in sales at the prescribed maximum prices. By acting as "agents" for the retailers and charging expenses and commission, some wholesalers contrived to make a profit at the expense of the retailers. The effect of these conditions was that the wealthier butchers in residential districts continued to obtain a supply of good meat because they were prepared to incur a temporary loss in order to retain and increase their custom, and the poorer industrial areas were left with an irregular supply of the inferior meat. Distribution was unequal as between the rich and the poor, while both retailers and wholesalers were losing a very large sum of money every week through a system which retained competitive trading at the supply end, but imposed maximum prices in distribution.

Such a state of things could not continue. During the week or two before Christmas, 1917, the Food Control Committees were in many cases allowing the butchers to exceed the maximum retail prices, and, if steps had not been taken to secure control of the live stock, the whole of the control of meat prices must have broken down.

Inception of Grading and Allocation.—On 24th December, 1917, the Food Controller accordingly made the Cattle (Sales) Order,* under which regulations were issued compelling all cattle to pass through a market, where they were to be graded and allocated to the butchers in accordance with the requirements of their customers at fixed prices mentioned in the schedules of the Order. The effect of the Order was that the Food Controller became the sole purchaser of all beasts for slaughter. By his agents in each market the Food Controller buys the proportion of the fat stock required from that market for the nation's meat supply. He thereupon re-sells some of the beasts to local butchers present in the market and sends others for sale (alive or dead) in distant industrial centres.

Even so, there could be no flat rate to the consumer unless the charges entailed in sending cattle or meat to distant centres could be met, and, accordingly steps were taken to equalise the cost of all charges between the farmer and the butcher's shop, no matter how far apart the districts in which they might be situated. In order to meet these charges of distribution, the Food Controller decided to collect a fixed "per head" charge on every beast bought and sold, these charges being pooled and the total costs of such distribution borne out of that pool, which is known as the "Central Live Stock Fund." The "per head" charge, therefore, is simply an equalising charge collected by the Food Controller in the course of the transactions between himself and the farmer on the one hand and the butcher on the other. In return the farmer and the butcher are relieved of all expenses between the farm and the retail shop. This has the desired effect of making the return to the farmers and the price of the meat to the butcher and to the retail customer the same in every case, whether the farmer and the butcher are situated alongside one another in a country village, or whether they are as far apart as Aberdeen and London.

It should be noted that there is no question of any profit being made by the Food Controller. The Live Stock Fund is merely a device for pooling varying costs and charges on the one hand and meeting them by a flat-rate charge on the other. As the services rendered, and consequently cost, increased, so the flat-rate charge has had to be increased. The whole finance is based on an attempt to make ends meet exactly, so that the Ministry of Food is involved in no loss and makes no profit.

During the first few months of control it was only possible to make the per head charge cover the three items of railage, auctioneers' fees and selling commission, and for this purpose a per head charge of 30s. per beast was imposed, this amount being collected in the following manner:—

The price to be paid to the farmer for his beasts was assessed at 1s. per cwt., or (on the average) 10s. per beast, less than the full price which would have been paid for the beast according to the schedule price of the dead meat expected to be obtained therefrom, and the price to the butcher was put at 20s. per beast in excess of the scheduled price. As a temporary expedient, for two months only, pending a readjustment of the maximum retail prices, retail traders paid the per head charge (averaging 20s. per beast) out of their profits.

Expenses between Farm and Retail Shop.—It had been intended to adjust retail prices at the end of the two months so as to balance the

* Printed in this *Journal*, January, 1918, p. 1150.

account exactly ; but just at that moment it was found necessary to introduce a rationing scheme based directly on the cost of meat to the consumer, and it was thought undesirable to disorganise the introduction of the scheme by suddenly altering all the retail price schedules throughout the country. Consequently, it was necessary to put the price to the butcher right on the basis of the then existing schedule of retail prices by temporarily remitting the 20s. charge which he had been paying. Farmers' prices and the retail prices remained unaltered. But at the same time the services covered by the per head charge were extended, as was originally intended, to cover all expenses between the farm and the retail shop.

These expenses were :—Railage on live stock from farm to market ; grading committees in each market ; auctioneers' commission ; market tolls ; lairage ; feeding ; insurance ; railage from market to slaughter-house ; dealers' charges on transfers of stocks ; droving ; slaughtering charges ; slaughter-house dues ; meat-market dues ; refrigeration and sheeting ; cartage and portorage ; railage on dead meat ; Wholesale Meat Supply Association commission ; adverse differences between live-weight and dead-weight prices on cattle purchased on Government account ; administration.

An estimate of the average cost of the above charges was made before live stock control was instituted, and assessed at 43s. per beast. This estimate has since been proved to be correct over a period of some months, but is bound to vary from time to time.

The introduction of rationing on a price basis rendered it necessary to get the prices of all imported meats on to a parity with the retail prices of home-produced meats. On no other basis was it possible to make a rationing scheme workable under which each individual was entitled to a certain value of meat per week. The prices of imported meats varied from country to country and from week to week, the general tendency in North America, at any rate, being upwards. Consequently, it was necessary, if all imported meats were, so far as the butcher is concerned, to be brought on to the same basis as home-produced meat, for the Ministry of Food to take over the purchase of imported meats, to pool their prices and to sell them to the butcher at the same flat price, so that he in his turn could retail them at the fixed flat retail prices.

On this basis some imported meat had to be sold at a considerably lower price than that which the Ministry had to pay for it, whilst on other imported meat considerable profit was made. The balances, whether in favour of or against the Ministry of Food, were paid into or charged from the Live Stock Fund, and since, during most of 1918, owing to the difficulties of the shipping situation and the necessity of transporting American troops, we were mainly dependent on North American frozen meat, whose price basis is far higher than any meat in any other market, and which costs considerably more than the price at which it was retailed here, there was a considerable charge on this head against the Live Stock Fund.

How the Live Stock Fund Works.—Next it was arranged, in order to secure an even flow of cattle to the markets throughout the winter months, that the prices received by the farmer for his cattle should increase from month to month throughout the winter. But it was impossible to organise rationing if the price to the consumer was correspondingly to vary from month to month. Consequently it was

necessary to arrange that, though the farmer received a varying price for his cattle, the butcher continued to get his meat wholesale at a flat price. This was secured by throwing the differences in the months when the prices to the farmer were high as a charge on the Live Stock Fund. Thus the Live Stock Fund has to meet :—

- (a) The charges between the farm and the butcher's shop set out above.
- (b) Any adverse balances from time to time in connection with the purchase and re-sale at the fixed price of imported meat.
- (c) The additional prices paid to the farmer for cattle produced in the later winter months.

The only sums, in addition to profits on certain classes of imported meats collected for the credit of the Live Stock Fund, are the per head charges on live stock, and these charges have been adjusted from time to time so as to meet exactly the sum total of the liabilities estimated as nearly as possible without any profit and without any loss to the Ministry.

Avoiding a State Subsidy.—As stated above, during the period from March to September, 1918, when retail prices were adjusted, the sum of only 10s. per beast was collected as against the estimate of about 43s. per beast. During this period considerable arrears accumulated to the debit of the fund, and it was necessary that, if possible, such arrears should be wiped off before the end of the financial year—31st March, 1919. The per head charge, therefore, was calculated for the period from September to March on a sufficiently heavy basis to balance the account by then, and, at the same time, so as to enable the butcher to pay the per head charge in the price of his meat, the retail prices to the consumer were increased approximately 2d. per lb. The increase in prices and the increase in the per head charge came into operation in the latter part of September, 1918. This per head charge, the amount of which depends on the weight of the beast, has been calculated so as to provide a sum sufficient to cover all the charges set out above as well as all the arrears on the period between March and September, 1918. It should be noted that some of these charges cannot be exactly tabulated. For example, instead of there being an adverse balance on imported frozen meat, it is anticipated that there will be considerable advantage accruing to the fund owing to the fact that we are much less dependent on the high-price American meat and shall receive much larger quantities of the lower-price Australasian meat. But, on the other hand, it is not possible exactly to estimate the number of cattle that will come forward at the higher prices during the later months of the winter. If, as time goes on, it should appear that the Central Live Stock Fund may become insolvent, the "per head" charge would have to be increased to the extent which is found to be necessary.

The remarks with regard to cattle apply *mutatis mutandis* to sheep. It may also be interesting to note that the question whether the Central Live Stock Fund will be in credit or debit at the end of the financial year—March, 1919—depends upon the variations which may take place in the many items with which it is concerned, and until that date is reached it is impossible to say definitely how much the balance will be either way. (*National Food Journal*, 22nd January, 1919.)

AN inquiry was held at King's Lynn last summer on behalf of the Board of Agriculture into certain proposals for improving the outfall of the River Ouse. The special Commissioner appointed for the purpose was Mr. Sidney Preston, C.I.E., formerly Inspector-General of Irrigation in India. The inquiry extended over many days; and the schemes put forward were exhaustively canvassed by leading engineers and counsel.

The result is an extremely informing Report, which has now been made public. The greater part of it is highly technical; but in the concluding paragraphs Mr. Preston draws attention to the state of this river system as a whole—which is unfortunately typical of many others in the country. He points out that it is useless to obtain a perfect outfall if the upper lengths and branches of the river are in such a state that the water cannot reach the outfall quickly enough.

So long ago as 1809 Sir John Rennie made his celebrated report on the drainage and navigation of this portion of the Bedford Level. He pointed out how obstructed was the outfall, how inadequate were the channels in this flat country to carry off the water at flood times, and how contracted were the waterways of bridges and sluices. Large and expensive works were carried out in the following half century for the improvement of the outfall. Reports prepared by Mr. R. F. Grantham for the Board of Agriculture in 1918, however, show that the river and its tributaries were then still in the same bad order that Sir John Rennie described more than a hundred years ago.

It should not be forgotten that the Ouse is one of the longest rivers in the country. Together with its tributaries, it forms the drainage outlet for 2,000,000 acres, the greater part of which is agricultural land of high value.

The causes of the neglect of this most important system in the past are attributed by Mr. Preston to the multiplicity of authorities having control over different sections of it. Certain of these authorities, it is true, carry out their drainage duties with vigour and efficiency. There can be little doubt, however, that Mr. Preston has put his finger on the vital spot. The depression in agriculture, of course, has had something to do with the general reluctance to spend money on improvements which are so much needed; but that cannot be the sole cause of the bad state of this river-system, since it does not account for more than 40 out of the 110 years that have elapsed since Sir John Rennie's survey.

The matter has now, however, forcibly attracted the attention of those most nearly concerned. The majority of the county councils whose counties lie along the Ouse and its tributaries have petitioned the Board of Agriculture to set up a single drainage board for the whole system. The Board hope shortly to prepare a scheme on which they will invite the criticism of the county councils, the existing drainage authorities, and the agricultural interests concerned. At present it is not proposed to deal with internal drainage, but only with the bed and banks of the main river and its principal tributaries. Prisoners are already employed on effecting such clearance about the upper reaches as can be carried out in the winter months.

FROM many parts of the country come further reports of interest and activity in the matter of land drainage. In South-west Lancashire

**Land Drainage in
Lancashire.**

the valuable triassic lands behind Southport possess several artificial systems of drainage which have been made and kept up by the large landowners of the district. These systems are mostly in good order, though they somewhat lack cohesion as a result of having been created by individual effort. The River Douglas, however, and its tributaries, which constitute the principal natural drainage system, are badly congested. The Lancashire Agricultural Executive Committee have been able in the past season to effect a substantial improvement, having taken over the functions of the Commissioners who control a portion of the rivers ; but the Committee have been heavily handicapped by the almost unprecedented rainfall of the autumn and winter, and, in spite of all their efforts, considerable areas of fine agricultural land are severely flooded. The neighbourhood in January presented a striking object lesson in the necessity for organisation on a wide basis and for constant watchfulness in the clearing and maintenance of rivers and artificial channels. These matters are of national concern ; and a haphazard system, which depends on the public spirit or enlightened self-interest of a few individuals, or on the energy and economic enterprise of a local authority with a limited area and limited powers, is no longer adequate to the circumstances of to-day.

Fortunately, this is recognised in many counties. In Lancashire, in the Holland Division of Lincolnshire, in the counties on the Great Ouse, in all three Ridings of Yorkshire, in Berkshire and in Surrey, as well as in Welsh counties like Flintshire, Merioneth, Cardigan, and Montgomery, there is a definite demand for a wider organisation of drainage areas. The Board of Agriculture hope to satisfy this demand to the fullest extent that the Acts of Parliament allow.

THE adverse conditions under which the Light Horse Industry was carried on during the year under review (1st November, 1917—31st October, 1918) were even more marked than in the previous years of the War. There was practically only one market for the riding horse, the Army market, which is not a sufficiently remunerative one to encourage breeding. There was, owing to the raising of military age, a further withdrawal from civil life of stud employees, shoeing smiths, etc., and no little difficulty was experienced in the proper feeding of horses owing to shortage of forage and the Horse Rationing Orders.

The very restricted supply of petrol for commercial motor traction, the ploughing of thousands of acres of grass land, and the purchase of draught horses for the Army, brought about a demand for heavy horses in excess of the supply, with the result that prices soared high above the normal, and many farmers, whose custom in past years had been to put their half-legged mares to thoroughbred stallions, sent the mares this year to heavy sires. In view of the above-mentioned circumstances it is not unsatisfactory to find that the average number of mares served by the Premium stallions in 1918 was 59.

It is to be hoped that those who have carried on in these difficult times and continued to breed light horses will reap their reward on the resumption of hunting and polo, on which the production of our high-class riding horses depends so largely.

The War has shown how important is the production of good active horses of strong constitution, and the Board have it from Field-Marshal Sir Douglas Haig himself that Cavalry has been, is, and will continue to be indispensable in modern warfare, however great the development of the Air Force may be in the future. In an advance, he says, mounted troops are essential, and in rear-guard actions their use has proved invaluable. They can be moved quickly to threatened localities and are not dependent on roads or railways; and traffic control, which is all important in the rear of the battle zone, cannot be carried out satisfactorily in the absence of mounted men. In open country, moreover, such as the theatre of war in which General Allenby's troops were operating, Cavalry played a most important part, and the use of them had a very decisive influence on the results obtained. In this connection it may be mentioned that the War Office have furnished the Board with reports on the suitability for war purposes of the

various types of horses used in the Army, and in all of them there is unanimity of opinion that the well-bred hunter on short legs and of moderate height is the ideal riding horse for the Army, and though the price which the War Office have hitherto been authorised to pay cannot secure the ideal, it is the type that breeders should aim at to produce. At its best it commands a remunerative price in the hunter or foreign market, and even if it misses the ideal it is the type required for Army purposes.

With reference to "misfits" the Board wish once more to emphasise, as they have done in previous reports, the importance of breeding not only from good sound sires, but from good mares as well. Some farmers apparently think that the selection of a mare for breeding is of little, if any, importance, provided she is put to a good stallion. The practice of breeding from a worn-out mare, which is past work and may never even have been bred from before, is simply courting failure. Unfortunately this practice is far too common. It brings discredit to many a good stallion and is responsible for a large number of the ill-bred animals which show no profit to the breeder and are of no value to the State.

Soundness is of first importance in breeding, and much has been done by the horse-breeding societies to educate breeders to this fact by withholding their prizes and premiums to sires unless certified sound. Since 1911, when the Board were first placed in funds for assisting the Light Horse-breeding industry, steps have been taken to encourage the voluntary registration of sound stallions, and so well has this scheme been supported that the number of stallions registered in 1918 was 2,019.

A big step forward in this direction has been taken during the year under review, and an Act of Parliament—the Horse Breeding Act, 1918—has been passed, making it illegal to travel a stallion for service after 1st January, 1920, unless it has been licensed by the Board as sound and suitable for breeding purposes.

Commissions and committees, that have reported during the last fifty years on various aspects of the horse-breeding industry, have drawn attention to the great harm done by the use of unsound stallions. The Government have received the support and approval of all the horse-breeding societies and of all those who have at heart the improvement of the horse-breeding industry; and though several years must necessarily elapse before the result of the Act will be apparent, there can be no doubt that the very greatest benefit will accrue from it.

Appended are the foaling results of the 1917 Service Season and information as to the Premium Awards and Service Season, 1918.

Foaling Results for Service Season, 1917.—From the returns furnished to the Board of the mares served by the 60 King's Premium Stallions the foaling percentage works out at 54, being the same figure as in 1915, though slightly below that of 1916. "Stortford," the property of Captain Faudel Phillips, proved to be the best foal-getter of the year, serving 82 mares with a foaling percentage of 78.

The 40 Board's Premium Stallions had an average foal-getting record of 53 per cent., which was slightly below the average for the 1916 season (56). The worst record of any subsidised stallion was that of a Board's Premium Horse which served 54 mares with a foaling percentage of 13. This stallion has been castrated.

The average amount paid by the Board for the 48 King's Premium horses was £277 and the maximum £348. With the addition of the service fee of £1, payable by mare owners, the average earnings became £340 and the maximum £438. The average payment for the 12 Super-Premium Stallions was £399 and the maximum £464, and the average and maximum earnings were £470 and £554 respectively.

Service Season, 1918.—Owing to the commandeering of the Agricultural Hall for war purposes, the Annual Show was held at the Park Paddocks, Newmarket, which were kindly placed by Messrs. Tattersall at the disposal of the Board and the Hunters' Improvement and National Light Horse Breeding Society for the purpose, and the arrangements made for the stabling and exhibition of the horses were all that could be desired. The Show took place on 5th and 6th March and there were 156 entries, of which 36 were stallions that had not been previously shown. The Judges were Mr. J. W. A. Harris, Lieut.-Colonel J. McKie, D.S.O. and the Hon. Alexander Parker. They reported that the quality of the horses exhibited showed an improvement on 1917, when the standard was a very high one.

Sixty King's Premiums (including 12 Super-Premiums) were again awarded, and the King's Cup was won for the second time by "Rathurde," a stallion owned by Captain T. L. Wickham-Boynton. The reserve horse was "Gay Lally," the property of the Compton Stud.

The sixty stallions to which the King's and Super-Premiums were awarded served 3,665 mares—an average of 61 mares a

stallion. Premiums (termed Board's Premiums) were awarded on the recommendation of the County Horse-breeding Committees to 33 other stallions, and these horses served 1,857 mares, being an average of 56 mares a stallion.

Riding Pony Premiums.—Six of these Premiums, of the approximate value of £80, were awarded in 1918. The average number of mares served by the six stallions in 1918 was 47, as compared with 45 in 1917. The foaling percentage to the 1917 service was 55, as compared with 58 in the previous year.

Premiums to Welsh Cob, Fell, Dale, Mountain and Moorland Ponies.—Sixteen Premiums for Welsh Cobs were awarded in 1918, and they travelled as follows: 3 each in Cardigan, Carmarthen and Montgomery; 2 each in Brecon, Merioneth and Radnor, and 1 in Glamorgan.

Three Premiums were awarded to Dales Pony Stallions on the recommendation of the Dales Pony Improvement Society, and 5 Premiums were awarded to Fell Ponies selected by the Fell Pony Committee.

Twenty-six Premiums were awarded to Mountain Ponies in Wales and ten to those in the New Forest.

Brood Mares Scheme.—As was the case in 1917, no funds were provided in 1918 for the award of grants to County Committees for the purchase of brood mares.

Registration Scheme.—During the year 1917-18, the number of stallions placed on the Board's Register was 2,019, the highest number yet recorded, and nearly 200 more than in the previous year. The stallions comprised 1,183 Shires, 262 Thoroughbreds, 155 Hackneys, 151 Clydesdales, 149 Ponies, 79 Suffolk Punches, 16 Percherons, 13 Hunters, 5 Yorkshire Coach Horses, 3 Cleveland Bays, 2 Welsh Roadsters and 1 American Trotter.

The number of stallions rejected was 125, of which 97 were Shires, 8 Clydesdales, 7 Thoroughbreds, 7 Suffolk Punches, 3 Hackneys, 1 Cleveland Bay, 1 Hunter and 1 Pony. 75 of the rejections were in respect of stallions which were being examined for the first time, the remaining 50 being those of stallions which had been registered in previous years. The rejections were on account of the following diseases: whistling 33, roaring 32, sidebone 25, cataract 11, ringbone 7, stringhalt 4, bone spavin 4, shivering 3, and defective genital organs 2. One stallion was rejected on account of bad conformation and 3 were considered to be generally unsuitable for

registration. Thirteen appeals were made against the verdict of the examining veterinary surgeons, and five of them were successful.

The National Stud, under the able Directorship of Captain Greer, continues to show a balance on the right side, in spite of the very adverse conditions that have affected the blood-stock industry during the year under review. Fourteen yearlings were sold at an average price of £460; eight mares were drafted and one purchased.

THIS Scheme was brought into operation in the spring of 1914, with the object of grading up and improving the ordinary farm stock of the country by educating farmers to the commercial advantages of using good, sound pedigree sires and of keeping records of the milk yields of their dairy cows. For this purpose grants were made last year in respect of 710 bulls, 264 boars, 110 heavy horse stallions and to 25 milk-recording societies.

The close of the current financial year (31st March, 1919) will complete the quinquennial period for which the Development Commissioners agreed to finance the Scheme. Though it is far too early yet to expect any marked improvement in the stock of the country, the Board are satisfied that the Scheme is sound in principle and gives every promise of proving effective in operation. With the consent of the Treasury and the Development Commissioners it has been decided, therefore, that the Scheme shall be continued and be regarded as one of the normal activities of the Board in the future, and that the expenditure thereon shall be borne on the Board's vote and not be a charge on the Development Fund.

It is intended to amend and develop the Scheme as opportunity offers, but no alteration will be made for the year ending 31st March, 1920.

The funds available next year for the award of grants will be approximately £25,000, an increase of £1,000 on the current year's grant, and this has been provided for developing milk recording, as it is hoped to extend this important section of the Scheme next year.

OFFICIAL NOTICES AND CIRCULARS.

N.B.—The Orders which may be mentioned in this section of the JOURNAL may usually be obtained at the price of 1d. each from H.M. Stationery Office, Imperial House, Kingsway, London, W.C. 2, and 28, Abingdon Street, London, S.W. 1; 37, Peter Street, Manchester, and 1, St. Andrew's Crescent, Cardiff.

THE following letter (No. C. L. 114/C. 1), was addressed to Agricultural Executive Committees by the Food Production Department of the Board on 1st February :—

Future Organisation of Agricultural Executive Committees. SIR,—1. The Board have had under consideration the question of the future organisation and work of the Agricultural Executive Committees in view of the signature of the Armistice and of the fact that the powers under the Defence of the Realm Regulations which the Committee have exercised on behalf of the Board will shortly expire and be replaced by the provisions of Part IV. of the Corn Production Act, 1917.

2. The present Executive Committees were appointed early in 1917 by the War Agricultural Committees of the County Councils, with the addition of members appointed by the Board. Under present conditions it does not seem necessary to retain the War Agricultural Committees, but it will be necessary that there should be in each county an Executive Committee who can act as the Board's agents for the administration of the powers of the Board under Part IV. of the Corn Production Act. These Committees will be responsible to the Board and their expenses will be paid by the Board. They cannot, therefore, be statutory Committees of the County Councils, but it is very desirable that they should be constituted in such a manner as will avoid any possibility of friction or duplication of work between them and the statutory Committees of the County Councils who are dealing with agricultural questions, such as the Agricultural Education Committee and the Small Holdings and Allotments Committee.

3. The Board have decided that the best method of securing this object will be to invite the County Councils to nominate a majority of the members of the Agricultural Executive Committees, and they have, therefore, made the Cultivation of Lands (Committees) Order, 1919, of which a copy is enclosed.* This Order provides that the existing Agricultural Executive Committees shall continue in office up to 31st May next, when they will be replaced by new Committees consisting of 12 members, of whom eight shall be appointed by the County Council and four shall be appointed by the Board. Probably some members of the existing Committees after two years of incessant work may wish to retire; but I earnestly hope that we may be able to retain the experienced services of the majority. These Committees when constituted will exercise the powers under the Defence of the Realm Regulations so long as they remain in operation, and when those powers expire the Committees will be appointed to act as the Board's agents for the purposes of Part IV. of the Corn Production Act, 1917, in accordance with the provisions of Section 11 (2) of that Act. The Board are sending a copy of this letter to the County Councils with the request that they will nominate their proportion of the new Committees, and as soon as the Board have received the names of those nominated they will proceed to appoint their proportion.

* See p. 1362.

4. Pending the appointment of the new Committees, the present Committees should continue their work, but the Board desire to take this opportunity of stating the policy which the Committees should adopt during the next few months and of indicating some of the modifications which should be made in the scope of their activities.

5. In the first place, the Board desire to emphasise the fact that although the conclusion of the Armistice has relieved materially the food situation, it is still a matter of great national importance to produce as much food as possible at home. It is happily the case that our bread supply for the present cereal year is secured, largely owing to the special efforts of the farmers last year. But for some time to come the production of many Continental countries will fall below the pre-war level, and their demands on the exportable surplus of the World will be very considerable. It is clear, therefore, that if during the next year or two there is a bad harvest in North America there might be very serious difficulty in supplying the needs of the importing countries. Consequently on grounds of ordinary prudence it is essential to produce all we can at home so that we may be dependent as little as possible on imports. On the widest grounds of national welfare it is also desirable that a considerable proportion of the population should be employed upon the land, and this employment can only be provided if the maximum output from the soil is attained and maintained. Finally, for financial reasons the adoption of this policy is urgently necessary. As a result of the War the country is burdened with a gigantic foreign debt, and for the purpose of paying off this debt and redressing the adverse balance of trade it is essential that we should increase our own production. It should be the duty, therefore, of the Agricultural Executive Committees to stimulate agricultural production in all possible directions, and under present conditions the Board are of opinion that the most effective method of doing so will be to endeavour to secure maximum yields from the existing arable land, and at the same time to make special efforts to improve those pastures and meadows which, from the texture of the soil, or from their superior quality, their altitude or their liability to flooding, will probably always remain grass. A great field of work can most usefully be undertaken in this direction, as there is little doubt that in most districts the grass land is much less well farmed than the arable.

6. Until demobilisation of the Forces has been completed and normal conditions have been restored, the question of the supply of labour for the land is likely to be uncertain and difficult. On this ground alone, apart from other considerations, the Board have come to the conclusion that it would be undesirable at present to compel farmers generally to increase their liabilities by requiring any considerable extension of the tillage area through the conversion of more grass land to arable. At the same time the Board desire to make it clear that, since the need for increased production remains, Committees should not abstain from requiring farmers to plough up grass land in those cases in which it is desirable to change the mode of cultivation so that more food may be produced. The ploughing policy of the Board, adopted as a war measure, has been amply justified and has resulted in a very large addition to the food supply of the nation. Where the local conditions are favourable where labour is available, and where necessary pasturage for live stock has been provided, it is in the national interest that suitable land should be kept or brought under the plough. On the other hand the Board recognise that under the stress of war conditions mistakes may have been made, and that cases have occurred where land was ploughed up

which it is not desirable to retain permanently under the plough. Committees should offer no objections and should, indeed, encourage the seeding-down of this land to grass as soon as it can be properly prepared for sowing. But it is hoped that, wherever possible, more suitable land for the plough may be substituted, in order that the total arable acreage may not be reduced.

7. It is the earnest desire of the Board that the increased arable area which has been secured should be maintained and that we may never again relapse into the state of affairs before the War when the food supply of the nation was to such a large and dangerous extent derived from other countries.

8. The principal duties of the Committees, therefore, during the present year should be to consolidate their gains and to use every effort to improve the general standard of farming, so that the production of all forms of agricultural produce may be increased to the maximum.

9. This policy involves some reconsideration of the arrangements for the survey which the Department asked the Committee to undertake in their letters of the 27th September, and 10th October last. When those instructions were issued it seemed probable that the War would continue for many months, and it was necessary as an immediate measure of national defence and insurance to make preparations for the possibility that a further large addition to the tillage area would be essential to safeguard the food supply. The survey was, therefore, designed with the principal object of classifying all the grass land in the country, so that, if it proved necessary, ploughing orders could be issued without delay. The signature of the Armistice has, however, so far modified the situation that under present conditions the Board have come to the conclusion that a complete classification of grass land is not immediately necessary. In counties where such progress has been made with the survey that it can be readily completed, it should be finished, if necessary, with professional assistance. But, speaking generally, the Board think that Committees should now concentrate themselves on surveying those farms which are insufficiently cultivated, in order that any necessary action may be taken to raise the standard of farming.

10. The signature of the Armistice also made it necessary to consider the position of the tractor and horse schemes and the staff and administrative expenses of the Committees. The Board have received indications from several Committees that in their opinion farmers will soon be able to do their work independently of the assistance of Government tractors and horses, and the heavy expense of direct Government cultivation makes it highly desirable to replace the present schemes by private enterprise without delay. The Board have decided, therefore, that arrangements should be made as soon as possible after the spring cultivations are over to dispose of all the Government tractors and horses for use on the land. Detailed instructions on the subject will be sent to you shortly by the Cultivation Division of the Department, but it was considered desirable that the Committee should have early notice of the Board's intentions, so that they should not enter into fresh commitments or undertake contracts which cannot be completed before 31st May.

11. The limitation of the survey and the disposal of the tractors and horses will enable a very considerable reduction to be made in the staff and administrative expenses of the Committees. The Board would be glad to receive at once a statement giving particulars of the names and salaries of the officers of the Committees whose services can be dispensed with immediately, and the necessary steps should be taken

by the Committees to terminate their engagements by one month's notice. The staff engaged on the tractor and horse schemes should be informed that their services will probably not be required after 31st May. It appears to the Board that it will not be necessary to retain the services of the District Executive Officers after that date and the question of the salaries paid to the Secretaries of the District Committees should also be considered.

12. In conclusion, now that the special war work which the Committees have undertaken is drawing to a close, I desire to express personally and on behalf of the Board our warm appreciation of the unvaried efforts which have been made by the members and officials of the Committees to carry out the policy of the Government. In spite of great difficulties and many discouragements the Committees have accomplished a great work, the fruits of which will remain as a testimony to the patriotism and public spirit of the agricultural community. The Committees have created a link between the farmers and the Government, which it is hoped will not be broken; they have contributed materially to the solution of the grave difficulties in regard to food with which the nation was confronted during the War; and they have succeeded in raising the general standard of farming throughout the country.

13. It is largely due to the work of the Committees that the importance of agriculture in the national economy is much more generally recognised than was the case before the War, and the Board feel that they can rely confidently on the continued co-operation of many of the members and officials in connection with the new Committees which will carry on the work under peace conditions.

I am, etc.,
(Signed) R. E. PROTHERO.

THE Board of Agriculture and Fisheries have made an Order (No. 73), dated 25th January, 1919, to the effect that:—

**The Cultivation of
Lands (Committees)
Order, 1919.**

1. On the appointed day the provisions of the Cultivation of Lands Order, 1918 (No. 2),* as to the reconstitution of bodies to exercise powers conferred on the Board by Regulation 2M, and as to the maintenance by any such body of an Executive Committee, shall cease to operate, and Agricultural Executive Committees constituted in manner prescribed by this Order shall come into office.

2. For each administrative county there shall be constituted an Agricultural Executive Committee consisting, unless the Board by Order otherwise direct, of twelve members of whom eight shall be appointed by the council of the county and four shall be appointed by the Board.

3. In the case of a county in Wales (including Monmouthshire) two of the members appointed by the council of the county shall be the members representing the council of the Welsh Agricultural Council.

4. An Agricultural Executive Committee constituted under this Order may exercise within the administrative county any power which under any Order specified in Part I, of the Schedule hereto may be exercised by or through an Executive Committee referred to in that Order, and any such Order shall have effect as if the Committee constituted under this Order were the Executive Committee referred to in that Order.

* Printed in this *Journal*, September, 1918, p. 718.

5. The Board of Agriculture and Fisheries in exercise of the powers conferred by Regulation 2 R do hereby authorise any Agricultural Executive Committee constituted under this Order to exercise on and after the appointed day within the administrative county any power which under any Order specified in Part II. of the Schedule hereto may be exercised by an Executive Committee referred to in that Order.

6. (i.) The Committee constituted under this Order for any administrative county may, with the consent of the council of any county borough which is surrounded in whole or in part by the county, exercise within the county borough the powers which the Committee is by the Order or any other Order made by the Board under the Defence of the Realm Regulations authorised to exercise within the county or any of such powers, and for the purposes of the exercise of the said powers within the borough the Committee and the council of the borough may appoint in such manner as may be agreed a committee to act as a sub-committee of the Agricultural Executive Committee, but all acts of the sub-committee shall be submitted to the Committee for their approval.

(ii.) The Cultivation of Lands (County Boroughs) Order, 1917,* is hereby revoked.

7. Any notice, direction, licence, or authority issued under any Order specified in the Schedule hereto by an Executive Committee referred to in that Order shall, as from the appointed day, operate as a notice, direction, licence or authority issued by an Agricultural Executive Committee constituted under this Order.

8. The appointed day for the purposes of this Order shall, unless the Board by Order or otherwise direct, be the 31st May, 1919.

PART II.

The Rookeries Order, 1917.

The Rabbits Order, 1917.||

The Destruction of Pheasants Order, 1917 (No. 2).§

THE following Notice was issued by the Food Production Department of the Board on 14th February :—

Feeding Value of Rye Grain. Until recently rye grain might only be used for human food ; it may now be used for any purpose. Stock-keepers, therefore, should look to rye as a means of supplementing the short supplies of the standard feeding-stuffs. In general composition rye closely resembles wheat, but it is not quite so appetising, nor is it so suitable for meat or milk production. It is best adapted for working animals, or for other animals getting plenty of exercise. It should, at first, be given only in small quantities and along with other foods, but it should not be fed unless it is in sound condition and comparatively free from ergot. Ergot was fairly common in rye last year ; after

* Printed in this *Journal*, December, 1917, p. 1,009.

† See footnote on p. 1362.

‡ See this *Journal*, November, 1918, p. 992.

|| Printed in this *Journal*, June, 1917, p. 369.

§ See this *Journal*, June, 1917, p. 370.

threshing, most of the ergot will be found in the screenings. As ergot may cause abortion no rye screenings should be fed to pregnant animals if there is any suspicion that ergot is present. A typical ergot in rye is an elongated, slightly-curved, purplish-black body about half-an-inch long and one-eighth broad; when broken the inside is of a dirty-white appearance.

The quantity of rye fed to horses should not at first exceed one-fifth of the total grain ration, but this may be gradually increased to one-third if care is taken to ensure that the rye is thoroughly masticated, by crushing and mixing it, for instance, with chaffed hay or straw. Cows may receive up to 3 lb., sheep up to $\frac{1}{2}$ lb., and pigs according to age up to 3 lb. per head per day. For pigs, ground rye should be fed in a thin slop or mixed with chopped potatoes, mangolds, or other roots.

THE Food Controller has recently issued two Notices under the Cattle Feeding Stuffs (Maximum Prices) Order, 1918*:

Notices Issued under the Cattle Feeding Stuffs (Maximum Prices) Order, 1918. 1. *Order No. 57 of 1919.*—This prescribes that on and after the 27th January, 1919, the maximum price for compound cakes and meals (made from two or more ingredients where no oil is expressed in the process of manufacture) shall be either—

- (i.) A price not exceeding by more than 50s. per ton, or such other amount as may from time to time be prescribed by the Food Controller, the total of the cost to the maker of the ingredients used as delivered at his factory; or
- (ii.) A price not exceeding the highest maximum price for the time being in force under the principal Order for home manufactured cake and meal,

whichever shall be the lower price.

2. *Order No. 119 of 1919.*—This orders that as from 10th February, 1919, the Notice† varying the maximum price of flour millers' offals issued under the principal Order be revoked, and prescribes that as from 10th February, 1919, until further notice the maximum price on a sale of flour millers' offals shall be:—

- (a) On a sale of fine flour millers' offals £14 10s. per ton.
- (b) On a sale of coarse flour millers' offals £13 10s. per ton.

And that if any question arises as to the meaning of the words "fine" and "coarse" as hereby applied to flour millers' offals, such question shall be decided by the Flour Mills Control Committee.

Two Army Council Orders have been issued recently which came into force on 1st February, 1919, and have the following effect:—

The Removal of Certain Straw Restrictions. All restrictions upon the sale, use of, or removal of straw are removed (subject to the provision of the Waste of Forage Order, 1918), except in those cases where purchases have already been made on behalf of the Army or Civil Supplies.

In future straw will not be invoiced through the County Distributing (Forage) Committees as heretofore, but will be invoiced by the producer or grower to the wholesale dealer, retailer or consumer, as the case may be, at the price at which the straw is actually bought, and such invoiced

* Printed in this *Journal*, March, 1918, p. 1474.

† Printed in this *Journal*, December, 1918, p. 1136.

price must be the basis upon which all subsequent sales are made. These prices must not exceed the maximum stack prices set out in the Army Council Order, dated 20th August, 1918,* which are as follows :—

Oat, barley, rye, bean and pea straw and threshed tares, 1918 crop, £3 15s. per ton; 1917 or earlier crops, £3 6s. per ton.

Wheat, revit wheat, buckwheat, and mustard straw, 1918 crop, £3 per ton; 1917 or earlier crops, £2 15s. per ton.

In addition to the above prices for the 1918 crop, interest at the rate of 10 per cent. per annum may be added to the price at which the straw is sold by the producer, calculated from 1st January, 1919, to date of completion of lifting.

A wholesale dealer will be entitled to add to these prices the sum of 1s. 6d. per ton for buying charges, in addition to such other charges as are applicable.

A producer who sells straw direct to a consumer will not add the buying charge of 1s. 6d. per ton to the invoiced price, but he may add such other charges as are applicable. (*Board of Trade Journal*, 6th February, 1919.)

THE Food Controller does not purpose importing or pickling eggs this year, as he desires to leave the matter in the hands of the trade.

With regard to prices, control will have to remain until the price of eggs is reduced automatically to somewhere near its normal by increased supplies (*National Food Journal*, 12th February, 1919.)

THE names of 30,000 agriculturists have been forwarded by the Board of Agriculture to the Department of Demobilisation and Resettlement for early release from the Colours

Demobilisation of Agriculturists. as "pivotal" men in agriculture. It is understood that the demobilisation of these men is being expedited.

Agriculture has recently been granted a higher degree of priority in the Demobilisation Scheme, agriculturists now ranking for release equal with coalminers. Now that the majority of coalminers have been released, the dispersal drafts being sent forward will doubtless contain a large percentage of agriculturists. The records of the Military Authorities show that 54,000 agriculturists, including "pivotal," "contract," "slip" men, etc., had been demobilised up to February 12th. An Army Council Instruction issued in January allowed any agriculturist serving at home, whatever his medical category, to be attached to an Agricultural Company, pending his demobilisation. Over 12,000 men have been sent out to their former employers on furlough under this procedure.

Unless he has already done so, every farmer should take measures at once to get back any men whom he desires to employ and who are now with the Forces. The first thing for the farmer to do is to register such men as having employment ready for them immediately they are demobilised. Men who were in the farmer's employment on or before 4th August, 1914, should be registered as "contract" men. Other men who were not in the farmer's employment before the War should be registered as "slip" men.

Registration can be made at any Employment Exchange. All that need be done is to write out and fill in the date and signature to the

following declaration, and send it to the nearest Employment Exchange :—

“I/We (full name and postal address of employer) hereby declare that (full name and naval or military number and address of employee) was in my/our employment before 4th August, 1914, and that I/We are prepared to offer him employment as a (name and occupation) immediately on his return to civil life (or give the date after which the employment will be available).”

Farmers should write the name and other particulars of the man to be registered and also their own name and address as plainly as possible, and should refrain from adding to the information required any irrelevant matter. If the declaration here given is carefully and accurately filled up and sent to the Employment Exchange the farmer may rely upon the matter receiving immediate attention.

The above applies to men who were in the farmer's employment before the War. In the case of other men he desires to employ he should obtain a card (E.D. 406) from the Employment Exchange, complete it with the man's particulars and return it to the Exchange.

It is useless, however, to adopt this procedure in the cases of men who have joined up since 1st January, 1916, as these men are not available for demobilisation at present, being required for the Army of Occupation.

THE following Memorandum (No. C.L. 161/L. 2) was addressed to Agricultural Executive Committees by the Food Production Department of the Board on 14th January :—

Agricultural Labour :

**Functions of
Sub-Committees in
Demobilisation.**

1. The Government has decided that the Local Advisory Committees of the Ministry of Labour, Employment Department, are to be the responsible local bodies for dealing with the resettlement of labour on discharge from war jobs or on return from the Forces to civil life. These Advisory Committees have been advised to appoint, for each of the larger and well-organised industries in the locality, a “Trade Sub-Committee” to undertake work in connection with finding employment for men and women in the industry concerned.

2. The Board have arranged with the Ministry of Labour that the “Trade Sub-Committees” for the agricultural industry should be the Labour Sub-Committees of the Agricultural Executive Committees.

3. It is proposed that in the first instance, as far as the Employment Department is concerned, their responsibility for dealing with agricultural labour should be centralised at a single Employment Exchange in each county, so that for agricultural purposes the area of the Local Advisory Committee associated with such Exchange will be extended to cover the whole of the county and so will be identical with the area of the Agricultural Executive Committee.

4. A list of the Employment Exchanges with which Agricultural Executive Committees will deal in this connection is attached.*

5. In order to secure complete co-operation between the Labour Sub-Committee and the Local Advisory Committee of the Employment Exchange, the Ministry of Labour will appoint, where they consider it necessary, an Officer of the Employment Exchange to act with the County Labour Officer as Joint Secretary of the Sub-Committee in connection with the placing of civilian labour in agriculture. The Labour Sub-Committee will, of course, continue to act solely under

* Not here printed.

the general direction of the Agricultural Executive Committee, and will collect, as hitherto, information as to the vacancies for agricultural workers that exist in the county. Civilians seeking agricultural employment will be dealt with at the Exchange, and it will be the simplest procedure for the Labour Officer to attend at the Exchange to peruse the particulars of applicants, interview them when necessary, and with his knowledge of the existing vacancies arrange with the Employment Exchange Manager to what farmers the men can best be offered. The fullest interchange of information between the Labour Sub-Committee and the Employment Exchange will be essential.

6. The arrangement outlined in this Memorandum will be extended to all the activities of the Employment Exchange in connection with agricultural labour and the demobilisation of men now with the Forces. For instance, the Labour Sub-Committee, or an Agricultural District Committee acting in that behalf by arrangement with the appropriate Local Advisory Committee, will be the body that will advise the Local Advisory Committee, *e.g.*, upon the endorsement of offers of employment under paragraph 5 of the recent announcement of the Controller-General of the Department of Demobilisation and Resettlement, a copy of which has been sent to all Committees (see C.L. 159/L. 1, dated the 19th ultimo.)*

7. In connection with these arrangements the Board would be glad if Agricultural Executive Committees would reconstitute their Labour Sub-Committee where necessary. Such Committees should contain at least one representative of the Women's Agricultural Committee and an equal number of representatives of the farmers and the agricultural labourers. The District Wages Committee should also be invited to nominate one representative. In some instances, the existing Local Advisory Committees of the Employment Department contain representatives of farmers and agricultural workers, and, as far as possible, these gentlemen should be added to the Labour Sub-Committee.

8. A Memorandum with reference to the proposals set out above is being issued to Local Advisory Committees by the Ministry of Labour and the Board trust that all Committees will communicate as to these arrangements with the Local Advisory Committee attached to the Exchange with which they are associated.

THE following Notice was issued by the Food Production Department of the Board in January :—

Land Settlement for received at the Board of Agriculture, 4, White-
Soldiers. hall Place, S.W. 1, for the official pamphlets,

entitled "Land Settlement in the Mother Country," which have been issued by the English and Scottish Boards of Agriculture jointly with the approval of the Admiralty and the War Office. Two pamphlets have been printed, one intended for officers (L.S. 9), and the other for men (L.S. 8)†. The object of each is to explain the steps that have been or will be taken to settle ex-service men on the land after the War, and to explain impartially the prospects

* Not printed, in this *Journal*.

† See this *Journal*, January, 1919, p. 1152; also this issue, p. 1311.

of success of those who desire to take up farming or market gardening in the Mother Country.

It is pointed out that the conditions of agricultural life in this country are already widely different from what they were before the outbreak of war, Great Britain being to-day more nearly in the position of a self-supporting country than she has been for the last 40 years. The Government state that it is their desire and intention to maintain and extend so far as possible the revival of agriculture which has been brought about by the necessities of war. In order that the land of this country may be put to the fullest possible use for the benefit of the nation as a whole, it is necessary that as many individuals as possible should have a direct interest in the cultivation of the soil. Steps are, therefore, being taken to provide for the settlement on the land, either as owners or occupiers, of men possessing experience and qualifications.

One of the most difficult problems in connection with the provision of land for ex-service men is to estimate the possible demand which is likely to be made by sailors and soldiers in the course of the next year or two. Extensive inquiries with regard to this are already being made in France and other theatres of war, and particulars available at present indicate that the demand will be very large indeed. In fact it will probably prove to be physically impossible to acquire, adapt and equip sufficient land to satisfy the total number of likely applicants. At all events, sufficient is already known of the dimensions of the problem ahead of the Government to make it perfectly clear that only by delegating the duty of acquiring and equipping land for small holdings to Local Authorities throughout England and Wales will it be possible to obtain results on an adequate scale in the time available. The great majority of the small holdings available for ex-service men will, accordingly, have to be provided by the County Councils.

It must be remembered that before the War the County Councils had had considerable experience in the establishment of small holdings and the selection of suitable tenants. In the seven years, 1908-14, they acquired approximately 180,000 acres of land in England and Wales and placed over 12,600 small holders in possession of it. Moreover, these holdings have proved self-supporting and practically no charge in connection with them has fallen upon the rates. It will be admitted that these figures represent only a mere fraction of what has now to be taken in hand, but it is satisfactory to know that the machinery to undertake this work is already in existence, and in the past has proved its success. Any man who desires to obtain, after demobilisation, a small holding of not more than 50 acres in England or Wales should, therefore, fill up the form printed in the booklets referred to above, and forward it to the Clerk of the County Council of the county in which he wishes to settle.

It is obvious that in the interests of the men themselves, as well as of the nation as a whole, it will be necessary for the applications to be considered very carefully in order to avoid men being placed in small holdings who have not yet acquired sufficient practical and technical knowledge to make a success of the venture. Such a course would only lead to disappointment and cause a set-back to the whole movement. From every point of view it is desirable that the first men to be settled in small holdings should be possessed of adequate experience of farming or market gardening, whichever form of industry they decide to follow. These men would then act as pioneers of the

movement, and by their success prove a source of encouragement to others, who, not having had previous experience in the management of land, will be assisted as soon as they are demobilised to secure employment with a good farmer. The conditions of employment in agriculture have, of course, been very greatly changed during the War. District Wages Committees have been established throughout the country, and the agricultural labourer has the assurance of a due reward for his toil. In no county of England and Wales has a lower rate than 30s. for a week of 54 hours in summer and 48 hours in winter been fixed for any labourer over 18 years of age. The Government are already engaged in organising training facilities for ex-service men which will enable them to secure employment at the wages mentioned.

THE following Circular Letter was addressed to County Councils and Councils of County Boroughs by the Food Production Department of the Board on 14th January :—

**Land Settlement:
Circular Letter to
County Councils.**

SIR,—I. I am directed by the President of the Board of Agriculture and Fisheries to inform you that he is now in a position to supplement the information given in the Board's Circular Letter of the 18th December* last as to the financial arrangements for the settlement on the land of ex-service men.

2. The Government have come to the conclusion that while the County Councils are the most suitable bodies to be entrusted with the local administration of the matter, the financial responsibility for the loss which must inevitably occur in creating small holdings under present conditions should be borne by the Exchequer and no charge should be placed on local rates.

3. The Board have, therefore, been authorised to inform County Councils that, subject to their obtaining the approval of the Board to (1) the price or rent to be paid for any land acquired, (2) the scheme for the adaptation and equipment of the land, and (3) the rents to be charged to the small holders, the Board will repay to the Council the whole of the deficiency between revenue and expenditure on the small holdings undertaking of the Council as a whole, including the land already acquired. The repayments will be made at the end of each financial year up to and including the 31st March, 1925. This guarantee will apply to all approved schemes which shall have been submitted by the Council to the Board prior to 1st December, 1920. After this date the position will be reconsidered as regards any subsequent scheme.

4. After the 31st March, 1925, it is intended that a valuation should be made of the whole small holdings property of the Council. Any difference between the outstanding amount of the loans and the valuation will be written off by the State as irrecoverable, and the Council will then take over the whole responsibility for the property at the valuation price without any further control by or assistance from the State.

5. The Board feel sure that your Council will recognise that these arrangements will be effective in securing that no part of the loss incurred in carrying out a national obligation will fall on the county

rates. They will also have the advantage [that] the whole of the financial assistance from the Board will in future be given under one head, and will obviate the detailed accounting work of making separate claims to the Board in respect of one-half of the cost of ascertaining the demand for small holdings, one-half of the irrecoverable loss on each scheme taken separately and in respect of the expenses incurred in relation to the acquisition of land.

6. Legislation will be introduced as soon as possible to give statutory effect to the above arrangements, and also with the object of making such other amendments in the Small Holdings and Allotments Acts as experience has shown to be desirable.

7. As the whole of the financial responsibility has been assumed by the State, the Board feel confident that they can rely on the active assistance of your Council in carrying into effect without delay the desire of the Government to settle on the land of this country as many as possible of the ex-service men who are qualified to become successful small holders. The Board will be glad to receive at the earliest possible date concrete proposals from your Council for the acquisition of suitable land for the purpose, and I am to point out that the matter is one of great urgency in view of the approaching demobilisation of the Forces.

8. A further communication will be sent to you shortly as to the source from which loans will be made, but I am to say that under present conditions the rate of interest is not likely to be less than $5\frac{1}{2}$ per cent. In submitting their schemes, therefore, Councils should furnish estimates of the annual expenditure on the basis of the cost of the land and equipment at present prices with a $5\frac{1}{2}$ per cent. rate of interest on loans and of the annual revenue from rents, which should be fixed at such amounts as represent the fair rental value of the holdings. The Board feel sure that Councils will be vigilant guardians of the public funds which they will administer, and that they will exercise all possible care and economy with regard to the price to be paid for the land, the expenditure on equipment and the cost of administration.

I am, etc.,

(Signed) A. D. HALL.

Secretary.

Oats and Barley for Seed Purposes.—The Seed-Testing Station of the Food Production Department have recently reported that they are receiving a number of samples of oats and barley which have been heated in the stack. In some cases the germination of these samples has been only about 20 per cent., and in the majority of cases the germination has not been more than 60 or 70 per cent. It is not by any means always possible to detect this inferior capacity for growth by inspection of the sample. Farmers are, therefore, urged to exercise considerable caution before relying on grain for seed that has been taken from stacks which may have become heated.

In all cases of doubt as to the soundness of the grain, samples should be sent to the Seed-Testing Station to be tested before the seed is sown. Samples should be not less than 4 oz. and should be addressed

to the Food Production Department, 72, Victoria Street, London, S.W. 1. Envelopes for the purpose of sending samples may be obtained free of charge at the above address. A fee of 3d. should accompany each sample when the farmer requires the report for his own information, or 1s. if he wishes to make a declaration in respect of a sale.

Seed-Testing Figures.—During the year 1918, 14,569 samples of seeds were tested. During the first five months of the Station's second season, namely, 1st August, 1918, to 31st December, 1918, 8,185 samples were tested. Of these, 3,397 samples were wheat; 784 samples were oats. This season peas and vegetable seeds are being received in far greater quantity than last season. As showing the popularity with the trade already obtained by the Station, it may be mentioned that upwards of 160 seed firms have opened deposit accounts.

The Germination of Seeds.—As a result of conferences between representatives of the seed trade and the Food Production Department, it is proposed to fix official standards of germination for certain root seeds. When this is done germination standards will have been fixed for all seeds affected by the Testing of Seeds Order* with the exception of grasses and clovers.

Supplies.—A census of stocks and prospective supplies of agricultural and garden seeds in England and Wales recently taken by the Board of Agriculture indicates that, with a few relatively unimportant exceptions, ample quantities are available to meet the estimated demand for sowing this spring. The need for continued economy in the use of seeds should not, however, be overlooked. Allotment holders and other growers should calculate their seed requirements with care in order to prevent waste.

Purchasers are reminded that under the Testing of Seeds Order, seedsmen are required to disclose certain essential facts regarding the quality of the seeds they sell. Standards of germination and purity are specified in the Order and small packets of vegetable seed falling below these standards must be so declared. An implied guarantee that the seeds are up to or above the standards specified in the Order is therefore given with all packets of vegetable seeds affected by the Order unless the seller makes a declaration to the contrary at the time of sale. (See also article at p. 1328.)

As the result of inquiries made by the Food Production Department the following cultural hints and suggestions, based on the experience of farmers accustomed to late and wet dis-

Corn Growing in Late and Wet Districts. tracts, are issued with a view to assisting farmers now growing corn for the first time under the conditions referred to.

The first essential is sound, well-harvested seed, free from any suspicion of heating. If any doubt exists on the point a sample should be submitted for examination to the Government Seed-Testing Station, 72, Victoria Street, S.W. 1. Next, the farmer should aim at securing an early harvest—

(1) By sowing an early ripening variety suited to local conditions of soil and climate. For advice on this point application should be made to the Headquarters of the Agricultural Educational Staff of the

County or to the Food Production Department, 72, Victoria Street, S.W. 1.

(2) By the application of phosphates, preferably superphosphate, at the rate of 2 to 3 cwt. per acre at seed-time, with the addition, where the soil is poor, of $\frac{1}{2}$ to 1 cwt. per acre of sulphate of ammonia.

(3) By obtaining seed from an early district, *e.g.*, the south-eastern counties. The adoption of this or the previous expedient may advance harvest by 10 days or a fortnight.

THE Food Production Department made an announcement on 24th January, which will give satisfaction to a considerable number of farmers in the Eastern Counties, namely that

Mustard Growing : the restrictions imposed some time ago on
Restrictions Removed. the growing of mustard for seed have been removed.* The decision of the Food Production Department to make an Order prohibiting the growth of mustard for seed without a licence, and limiting the total area to 20,000 acres in England and Wales, was a war measure conceived in the interests of essential food production, and was arrived at prior to the conclusion of the Armistice. Recently representations were made from several of the Executive Committees in the principal mustard-growing counties that a larger acreage might safely be allowed, and in view of the improved situation with regard to food supplies, consequent on the suspension of hostilities, the Board of Agriculture have decided that it is not necessary to continue the restrictions on the growth of mustard for seed which have been enforced during the last two years. Accordingly, the recent Order has been revoked and all restrictions on the use of land for the growing of mustard for seed are now removed. There will be a considerable demand for mustard seed for export after the next harvest, and, in the view of the Board it is in the national interest that farmers should be free to grow what is likely to be a very profitable crop without the necessity of having to obtain a licence from the county Agricultural Executive Committee

THE following Notice was issued by the Food Production Department of the Board on 31st January :—

**Selected Seed
Potatoes.**

As part of its scheme for preventing the spread of Wart Disease, the Board of Agriculture arranged last year for the growth of a certain quantity of seed of immune varieties by Scottish growers. The crops were carefully "rogued," under the supervision of the Department's Inspectors, and specially selected. They are being sold through agents in different parts of England and Wales and a limited amount of seed remains on offer. The varieties represented are Ally, Lochar, Kerr's Pink, Dominion, Majestic, and Tinwald Perfection. Intending growers of potatoes in infected areas who have not yet secured their seed will be well advised to make early inquiries from the Commercial Secretary, Board of Agriculture, 72, Victoria Street, London, S.W. 1.

* See Note in this *Journal*, January, 1919, p. 1236.

If the Board of Agriculture is to be successful in its effort to combat the spread of Wart Disease of Potatoes, it is essential that the co-operation should be secured alike of the

**The Suppression of
Wart Disease.**

dealers in potatoes and the growers of potatoes. The Wart Disease of Potatoes Order* prohibits the sale of potatoes of an approved immune variety except by persons authorised by a licence, unless the sale is direct to a dealer in seed potatoes. All registered dealers must understand the necessity of obtaining a licence to deal in seed potatoes of approved immune varieties. The Food Production Department has published a list of these varieties, which can be obtained free from the Board of Agriculture, 3, St. James's Square, S.W. 1. Only these varieties may be planted in areas certified as infected with Wart Disease. When buying seed potatoes of these varieties the public should make a point of being assured that the person from whom they buy is a registered dealer and authorised to sell such seed. Small growers who may be tempted to protest against interference with their freedom of choice will do well to realise that the precautions which the Government is taking are in their special interest as well as to the national advantage. To prevent the spread of Wart Disease it is most important that the seed supplied for planting in infected areas shall be what is known as "true to type" and "free from rogues." If impure stocks of an approved variety are planted a premium is placed on further outbreaks of the disease. In past years impure stocks have been sold to allotment holders and others and serious losses have resulted in consequence to large numbers of persons of modest means. Moreover, the disease has been carried into areas hitherto regarded as free from infection. Obviously, it is to the benefit of all growers and traders to assist the Board of Agriculture in carrying out a scientific campaign against the development of one of the most serious perils to profitable potato-growing.

THE following Circular Letter (No. C.L. 53/S.3) was addressed to Local Authorities in England and Wales under the Destructive Insects and Pests Acts, 1877 and 1907, by the Board

Wart Disease of on 7th January :—
Potatoes Order of 1918: SIR,—I am directed to refer to the Circular
Circular Letter. Letter (No. 27/S 3),† addressed to Local Authorities on the 29th April last on the

subject of the Wart Disease of Potatoes Order of 1918. and to say that the Board desire me to call the attention of your Local Authority to Art. 4 (1) of the Order, which prohibits the sale of potatoes of an approved immune variety except by persons authorised by a licence granted by the Board, unless the sale is direct to a dealer in seed potatoes. The object of this requirement is to ensure that the seed supplied for planting in infected areas shall be true to type and free from rogues, since the planting of impure stocks will inevitably result in further outbreaks of the disease. Licences are only issued, therefore, for the sale of stocks in respect of the purity of which the Board are able to secure satisfactory evidence, and they will take a serious view of any

* Printed in this *Journal*, May, 1918, p. 212.

† Printed in this *Journal*, May, 1918, p. 211.

unauthorised sales of approved immune varieties which come under their notice.

It is desirable that all registered dealers shall be made aware of the necessity of obtaining a licence to deal in seed potatoes of approved immune varieties, and it will be of great assistance if your Local Authority will be so good as to arrange for their officers to take every opportunity of bringing the matter before the notice of the persons concerned in their district.

Copies of the List of Approved Immune Varieties and of the Wart Disease of Potatoes Order of 1918 will be supplied on application.

I am, etc.,

(Signed) PERCY G. DALLINGER.

For Commercial Secretary of the Board.

THE following Note was issued by the Food Production Department of the Board on 31st January :—

Serious losses have occurred this season in the pits of potatoes in various parts of the country. The Board of Agriculture advise growers to examine their pits at once. Where these are heated, the owner should either turn, dress, and reclamp ware and seed separately or adopt a system of ventilation—

The Ventilation of Potato Pits.

(1) By making ventilation holes about 1 ft. square along the bottom and on both sides of the pit. At the same time the whole ridge of the pit should be uncovered. The bottom of the ventilation holes should be sloped so that rain runs away from, and not into, the pit. During very severe weather these ventilation holes should be filled with loose straw ; or

(2) By removing the soil from the side of the pit, in strips 1 ft. wide, extending from the ridge to the base on both sides of the pit at distances of every 10 yards. The ridge of the pit should also be uncovered. During very severe weather these ventilation spaces should be filled with straw.

By ventilating the pits in one or other of these ways, it is hoped that the temperature will be kept normal ; and that the gases developed in the pits will be replaced by fresh air.

THERE is some ground for thinking that all farmers are not conversant with their rights under this Order.*

Where a calf is offered by auction in a market, the farmer may, if he is not satisfied with the price offered, take the animal away again. It is also open to him to sell to the Government buyer in the market at the maximum price of 20s. per calf, or to send his calf to a Government authorised slaughter-house for sale on the dead-weight basis.

Where calves are consigned to a Government slaughter-house, the sender should make arrangements for the necessary feeding and watering in transit. Several prosecutions for cruelty have recently been instituted owing to the neglect of this precaution. (*National Food Journal*, 8th January, 1919.)

* See this *Journal*, October, 1918, p. 886.

THE following Notice was issued by the Joint Committee of the Board of Agriculture and the Ministry of Food on 15th January :—

Sale of Pregnant Animals.

The attention of farmers is drawn to Clause 1a of the "Live Stock Sales Order,"* which provides that no person shall bring or send or cause to be brought or sent to any market for sale for slaughter or sell or buy for slaughter or cause or permit to be slaughtered any in-pig sow of any age, in-lamb ewe of any age, or in-calf cow or in-calf heifer.

If a farmer offers for sale or slaughter a pregnant animal he becomes liable for prosecution under this Order, and it is urged that farmers should take every care to ensure that animals marketed by them for slaughter are not in this condition.

ARRANGEMENTS are being made for an early distribution of cake or meals for ewes lambing before the end of April. There will be an allowance of 42 lb. per ewe, which is equivalent to about $\frac{1}{2}$ lb. per day for three months.

Provision of Feeding-stuffs.

Forms will be issued to farmers registered under the present cattle feeding-stuffs distribution scheme† early in January. Any farmer not registered under that scheme should apply for a form of application to the Live Stock Commissioner for his area or to the Chief Live Stock Commissioner, New County Hall, S.E. 1.

While every endeavour will be made to provide linseed cake, no guarantee can be given that this particular variety will be provided in every case.

The Food Controller has been requested to furnish an allowance of feeding-stuffs for goats. Certain quantities of bran are not required under the distribution scheme, and may therefore be sold and bought without certificates. Goat-keepers should, generally speaking, find no difficulty in obtaining the necessary supplies. Those who are unable to purchase supplies may, however, communicate with the Live Stock Commissioners for their areas or with the Chief Live Stock Commissioner, New County Hall, S.E. 1, when a certificate will be issued entitling them to obtain bran at the rate of $1\frac{1}{2}$ lb. for goats in milk and 1 lb. for billy goats during the next three months. (*National Food Journal*, 8th January, 1919.)

THE Food Controller has made an Order (No. 18), dated 16th January, 1919, providing that where a person who is named as a supplier in any certificate or certificates granted under the Cattle Feeding Stuffs (Distribution) Order, 1918,‡ has supplied or has made provision for the supply of such quantities of any class of cattle feeding-stuffs as are mentioned in every such certificate, he may, without regard to the restrictions imposed by this Order, dispose in such manner as he

* Order No. 517, dated 8th May, 1918. This Order was not printed in this *Journal*, but a Note respecting its main provisions was published in the issue for June, 1918, p. 350.

† Published in this *Journal*, November, 1918, p. 1008.

‡ Printed in this *Journal*, November, 1918, p. 1008.

shall think fit of the residue of such class of cattle feeding-stuffs remaining in his hands, and such cattle feeding-stuffs may be acquired by any other person accordingly, and the General Licence dated the 18th December, 1918 (S.R. and O. No. 1671 of 1918)*, is revoked.

THE Food Controller has made an Order (No. 94), dated 29th January, 1919, providing that notwithstanding the provisions of the Dredge Corn Order, 1917,† the Food Controller

The Dredge Corn Order, 1917: authorises that as from 10th February, 1919, until further notice such dredge corn as

General Licence. consists of a mixture of cereals grown together and containing more than one cereal as a main constituent may be used for the purpose of feeding live stock.

THE Army Council has made an Order cancelling the Order of 30th July, 1918‡ (which prohibits the lifting and using of hay and straw in England and Wales) in so far as it relates to

Removal of Restriction all oat straw, wheat straw, rye wheat straw, buckwheat straw, barley straw, mustard

Relating to Straw. straw, rye straw, pea straw, bean straw, and threshed tares in respect of which no purchase note has been signed on 1st February.

This forage is, therefore, released. The Order of 20th August last§ (which prescribed maximum prices for hay and straw) and the Orders amending it are not affected by the new Order.

THE following Notice was issued by the Joint Committee of the Board of Agriculture and the Ministry of Food on 15th January, 1919:—

Fertilisers. The position as regards the export of fertilisers from this country is that in the case of sulphate of ammonia some comparatively limited quantities are allowed to go to France, Belgium and other Allied countries, and to the sugar-producing colonies. Considerable export of nitrate of soda is also taking place from stocks accumulated by the Government for explosive purposes. Supplies for farmers' use are available from the same source. In the case of superphosphates, some limited quantities are being authorised on the understanding that the quantities so allowed are replaced by the manufacture of an equivalent amount of phosphate from coprolites produced in this country. No export of basic slag is allowed, but castor meal and leather meal in excess of the home demand are being sent to Allied countries, viz., France and Belgium.

With regard to the general position, the total supply of sulphate of ammonia during the present fertiliser season will be fully sufficient to meet all requirements and in excess of the quantity available last year. The supply of superphosphate is also ample and likely to be appreciably more than last year. Complaints as to the supply of basic slag are being

* Printed in this *Journal*, January, 1919, p. 1238.

† See this *Journal*, December, 1917, p. 1028; November, 1918, p. 1014; and December, 1918, p. 1135.

‡ Printed in this *Journal*, September, 1918, p. 747.

§ Printed in this *Journal*, October, 1918, p. 890.

received, but these are due to the excessive demand arising early in the season. The total output will probably be 20 per cent. more than last year, and up to the present the actual deliveries to dealers and farmers have been 16 per cent. greater. The forwarding instructions to makers have, however, been much in excess of the production. There are practically no stocks and the output is being despatched from the works as it is being produced.

Considerable quantities of bone and bone meal are now available at prices which compare very favourably with those of other fertilisers.

FARMERS will be glad to note that the supply of fertilisers generally for the current season is much greater than it was last year, but, in order to obtain their requirements it is essential that they should place orders with their usual merchants or co-operative societies well in advance of the time when they require delivery. Considerable difficulties still exist in regard to transport, and prompt delivery cannot therefore be assured. The prices prescribed by the Fertiliser Prices Order* for sulphate of ammonia, superphosphate and basic slag will remain unchanged up to the 1st June next, and farmers will gain nothing by postponing their orders till later in the season.

Arrangements have been made for the importation of a considerable quantity of phosphate rock. The demand for basic slag at the present time is greatly in excess of the production, but the total output for the whole season is likely to be about one-fifth more than it was in 1917-18. The slag is being despatched from the works as it is ground. Some approved agents have supplies of basic slag in stock, and farmers who are unable to obtain delivery direct from the works may in certain cases obtain their requirements from merchants' stores. Sulphate of ammonia is available in greater quantities than last year. It is understood that a number of makers have bone meal and bone flour for sale at lower prices than those ruling a few months ago, and immediate delivery of these materials can probably be obtained.

SOME less-grown fruits are at times worth the attention of allotment-holders with permanent plots. For example, the quince is a fruit

**Profitable and
Uncommon Fruit.**

that has been in great and increasing demand of late years. Many growers are of the opinion that the trees prefer a cool, moist soil and position. This may be correct, but for a number of years they have borne heavily in exposed positions on poor, sandy soils. In fact, they will succeed almost anywhere if they are given a fair amount of space, and the shoots and branches are not permitted to become too crowded. They should be grown as bush trees, allowing about 12 ft. each way, and given manure only when the trees are fruiting freely. If a rough gale comes when the fruit is about ripe, and blows it down, there is very little or no loss. It does not pay to keep the fruit after the middle of November; decay then begins to set in. The fruit will sell as soon as yellow. There are a number of

varieties, but the common or apple-shaped quince is one of the best, being closely followed by the pear-shaped sort. These two varieties can be especially recommended.

The blackberry known as the Himalayan Giant is worth the attention of the small grower. It grows strongly and will do well on a tool-shed, or rough fence. It may be grown like the loganberry and treated in much the same way. All the exhausted, weak or old wood should be cut out in the late autumn, fastening in all the current year's growth that is vigorous, for which there is room for. Every "eye" should send out a stout branchlet, with a mass of blossom producing large, black, luscious berries, giving a great weight of fruit on each plant. Any moderate soil will suit this excellent Rambler.

By Orders (Nos. 29, 56, and 90) recently issued by the Food Controller, the undermentioned Orders (among others to which reference has not previously been made in this *Journal*), are revoked, but so that such revocation shall be without prejudice to any proceedings in respect of any contravention thereof.

THE following Notice was issued by the Food Production Department of the Board on 24th January :—

Bee-keepers will be interested in the arrangement made by the Food Production Department and the Royal Commission on Sugar Supply by which sugar for bees will be available for spring-feeding. It should be noted, however, that this distribution will take place only to bee-keepers who have registered with the Horticultural Sub-Committee of their county. Each registered bee-keeper will obtain from the Horticultural Sub-Committee a certificate which on being presented to the local Food Control Committee will be exchanged for a sugar voucher available for the purpose of sugar from any retail or wholesale dealer.

Distribution of Sittings of Eggs to Small Holders, etc.

ARRANGEMENTS have been made for the distribution of sittings of eggs to small holders and cottagers during 1919* in the following counties :—

England :—	Hampshire.	Oxford.	Wales :—
Berkshire.	Hereford.	Rutland.	Anglesey.
Buckingham.	Hertford.	Shropshire.	Brecon.
Chester.	Isle of Wight.	Stafford.	Cardigan.
Cornwall.	Kent.	Suffolk, East.	Carmarthen.
Cumberland.	Leicester.	Surrey.	Carnarvon.
Derby.	Lincs (Parts of	Sussex, East.	Denbigh.
Devon.	Kesteven and	Warwick.	Flint.
Dorset.	Lindsey).	Westmorland.	Merioneth.
Durham.	Norfolk.	Wiltshire.	Monmouth.
Essex.	Northampton.	Worcester.	Pembroke.
Gloucester.	Northumberland.	Yorkshire.	Radnor.

The period covered for distribution is from 15th January to 30th April. In view of the increased value of the ordinary egg and the cost of maintaining stocks of high-class breeding fowls, it has been found necessary to raise the price of sittings above that of previous seasons. The eggs will be sold at 7s. 6d. per sitting, and if packed and sent by rail 1s. extra is required to cover the additional cost.

In view of the prospect of the revival of interest in poultry-keeping in consequence of the improvement in the feeding-stuffs situation, the value of encouraging the rearing of higher-grade poultry needs to be emphasised.

THE Returns of Acreage and Live Stock for England and Wales during 1918, recently published by the Board of Agriculture and Fisheries, record the result of the policy adopted by the Government early in 1917, of stimulating by legislative and administrative action the extension of the arable area and the cultivation of cereals and potatoes.

The total area under the plough, and the acreage of the three main corn crops and of potatoes, according to these returns, are as follows (the figures represent thousands of acres) :—

	1914.	1916.	1918.
Arable land	10,998	11,051	12,399
Wheat	1,807	1,912	2,557
Barley	1,505	1,332	1,501
Oats	1,930	2,085	2,780
Mixed corn	—	—	142
Total corn	5,242	5,329	6,980
Potatoes	462	428	634

The figures for live stock, in thousands, are :—

	1914.	1916.	1918.
Cattle	5,878	6,216	6,200
Sheep	17,260	17,951	16,175
Pigs	2,481	2,168	1,697

* Particulars of this scheme were published in this *Journal*, October, 1916, p. 685; see also this *Journal*, December, 1918, p. 1106.

† Agricultural Statistics, 1918, Vol. LIII. Part I. Copies may be obtained from H.M. Stationery Office, Kingsway, London, W.C. 2, price 2d. net, including postage.

It may be said from a study of the above figures that in the first two years of the War the area of arable land and of corn crops was maintained, and cattle and sheep were substantially increased, while in the latter two years the arable, corn and potato acreages were very markedly extended, cattle were maintained, but sheep and pigs were reduced below the pre-war level, pigs considerably so.

A general idea of the position in regard to both crops and stock may be obtained by comparing the average of the past five years with the four similar preceding periods, adding the figures for the single year, 1918, and confining the statement to arable land, the dairy herd and the ewe flock. The following table is abstracted in this connection :—

Period.	Arable Land.	Cows and Heifers in Milk or in Calf.	Ewes kept for Breeding.	Number per 100 acres of Arable Land.
	1,000 acres.	Thousands.	Thousands.	Cows and Heifers. Ewes.
1894-98 ..	12,467	2,084	6,994	16·7 56·1
1899-1903 ..	12,137	2,171	7,201	17·9 59·3
1904-8 ..	11,592	2,293	7,184	19·8 62·0
1909-13 ..	11,274	2,340	7,354	20·8 65·2
1914-18 ..	11,332	2,478	6,823	21·9 60·2
1918 ..	12,399	2,578	6,487	20·8 52·3

The actual increase of arable land during the War, *i.e.*, from June, 1914, to June, 1918, in England and Wales was 1,400,000 acres, or 12·7 per cent., but it was naturally greater in the grass districts than in those districts, such as the eastern counties, which were already mainly arable. In Norfolk, for instance, where over 70 per cent. of the farmed area was already under the plough, there was less scope than in Leicestershire, where about 80 per cent. was in grass.

Returns of the different crops for each of the counties of England and Wales, as well as for the whole United Kingdom, are also given.

THE following Circular Letter was addressed to Clerks of County Councils and County Borough Councils in England and Wales by the Board on 25th January :—

Destruction of Rats.

SIR,—I am directed by the President of the Board of Agriculture and Fisheries to acquaint you, for the information of your local authority, that the Board view with apprehension the evidence which reaches them from many districts of the damage and loss incurred by the depredations of rats, of the preventable damage to, or destruction of, foodstuffs, and of the further cause there is for anxiety regarding damage likely to be caused to growing crops in the spring time of the year.

2. The Rats Order, 1918,* made by the Ministry of Food under the Defence of the Realm Regulation 2J empowers your local authority to enforce the Order, and makes them responsible for its administration, under the further Order, cited as "The Local Authorities (Food Control) Order (No. 5), 1918,"† made by the Local Government Board on the 28th August last.

* Printed in this *Journal*. September, 1918, p. 761.

† Not printed in this *Journal*.

3. The Order first mentioned provides :—

(1) that the local authority may take such measures as they think proper for the destruction of rats alleged to be causing preventable damage or destruction to foodstuffs, including growing crops ; and

(2) that they may require the owner or occupier of any land or building—

(a) to take reasonable and proper precautions to prevent such land or building becoming infested by rats ;

(b) to remove from such land or building, or to destroy any accumulation of rubbish or other materials likely to attract rats ; and

(c) that the local authority may themselves take such measures as may be necessary to enforce directions given by them for the above-mentioned purposes in the event of non-compliance within seven days by the owner or occupier, who shall thereupon become liable for such expenses as the local authority may incur in securing compliance with their directions.

4. At the request of the Ministry of Food, the Board have undertaken to supervise the administration of the Order throughout England and Wales ; and, in view of the steady accumulation of evidence of the urgent need for energetic action, the President hopes that the existing Order, framed originally as a War measure, will be superseded at no distant date by such legislation as will enable the Board to enforce systematic rat destruction as a permanent measure.

5. Reports received from agricultural districts indicate that rats have multiplied enormously during the War, and that great damage and destruction is being done to foodstuffs. It is obvious that, unless active measures are taken to combat this, much of the benefit secured by the determined efforts lately made to increase production on the countryside will be lost.

6. In pre-war days the rat population of Great Britain was estimated to be 40,000,000, and the total annual food damage done by rats in rural and urban districts alone, on the assumption that each rat on an average occasioned a daily loss of one farthing ; was thus estimated to amount to £15,000,000. During the period of hostilities such methods as were customary throughout the country to keep them in check have been to a large extent suspended ; so, when it is further realised that the progeny of a pair of rats if undisturbed may amount up to 880 young rats in one year, the menace of a threatened plague of rats, and the enormity of the possible consequence of it after more than four years of war cannot easily be over estimated.

7. The Board, impressed by the urgent need for strong and immediate action in many districts, are adopting such measures under the guidance of an expert adviser as will, it is hoped, secure in the near future uniformity of action in dealing with the question. Details of the scheme will be communicated to you without delay. In the meantime, the President trusts that he may rely on the cordial co-operation of your local authority in taking such active and efficient steps under the Order as may appear, locally, in the circumstances to be required, such as the encouragement of rat clubs and advertisements calling attention to the essential and urgent duty of farmers and all individual

owners and occupiers of property to use all possible means of keeping down rats, clearing infested localities in their occupation, stopping up runs and rat-holes, and rendering buildings rat-proof.

I am, etc.,

(Signed) A. D. HALL,

Secretary.

THE following Notice was issued by the Joint Committee of the Board of Agriculture and the Ministry of Food on 8th January :—

New War against Rats: Help for Local Authorities. According to reports from agricultural districts, rats have multiplied enormously during the War, and great damage and destruction is being done to foodstuffs.

So serious is the position that a special department of the Board of Agriculture has just been set up, and an expert adviser, who has had considerable experience in the killing of rats on the Continent, has been appointed. Under the Rats Order issued by the Food Controller last August, local authorities were directed to take measures for the destruction of rats with a view to the preservation of crops and stocks. Some county councils pay a sum of money for each dozen of dead rats brought to them. In this way thousands of rats are being destroyed. But the local authorities, on the whole, have not done all that might be done. Inspectors of the Board of Agriculture are now going about the country, urging on the local authorities the pressing necessity of dealing with the plague. Representations have been received by the Board from agricultural authorities that permanent legislation dealing with the destruction of rats is desirable, and it is hoped to introduce a Bill in the first Session of the new Parliament.

It is estimated that a pair of rats will produce on an average 880 young ones in a year. The old methods of keeping them under, practised by professional rat-catchers and game-keepers, such as trapping, ferreting, and poisoning, have almost lost their efficacy. But even these efforts were largely suspended during the War.

The rat population of Great Britain is supposed to be 40,000,000, and it is estimated that the damage done by them every year amounts to £15,000,000. This sum does not include the destruction caused in docks and warehouses.

THE following Notice was issued by the Joint Committee of the Board of Agriculture and the Ministry of Food on 8th January :—

The Warble Fly Pest. Most farmers are aware of the prevalence of this pest, and, though few have seen the adult fly, most have, at some time or another, helped to squeeze the grub or "Bot" from its snug resting-place in the backs of the cattle. A few progressive farmers have endeavoured by systematic squeezing out, to eliminate this pest from their farms, but, although in some cases the number of "Bots" met with have been considerably reduced, their efforts have been ineffective owing to the lack of co-operation of their neighbours and the breeders from whom they buy their cattle.

The apathy met with among farmers with regard to this pest is due generally to ignorance of the damage it does. It has been estimated

that the damage this fly causes in the leather trade alone amounts to upwards of £300,000 a year, and this in addition to the loss resulting to the butcher from the "jellied beef" caused by the grub. This loss the farmer has ultimately to meet, as the price the trade offers is such as to cover these losses.

So serious is the damage caused to hides and beef that conferences have been held to discuss ways and means of dealing with the pest, as it is felt that organised action on the part of the farmers for several years will go far to abolishing the pest altogether. Investigation is already proceeding to find out the best way of abolishing the disease; it rests with the farmers to prove that he and his fellow workers by active co-operation can abolish the Warble Fly from its usual haunts. Farmers have always contested their right to manage their own affairs without legislative interference; we have here an instance where farmers, by suitable action fostered and encouraged by the help of the powers that be, can demonstrate their right to their attitude. For legislation, like the surgeon's knife, comes into operation when all other forces fail.

THE outbreak of Foot-and-Mouth Disease at Littlethorpe, near Ripon, in the West Riding of Yorkshire, mentioned in last month's *Journal*,

**Foot-and-Mouth
Disease.**

which was confirmed on the 9th January, spread rapidly to other farms in the immediate vicinity of the originally infected place. Twelve outbreaks were thus confirmed up to the 21st January, and information was received on the 3rd February of a further outbreak in the same locality. The restrictions which were imposed by the Board on the 9th January on the movement of animals over an area having a 15-mile radius from Littlethorpe have been modified as regards that portion of the area which is over five miles distant (approximately) from any infected place.

THE total number of cases of Rabies which have been confirmed to date since the present series of cases commenced in September last

Rabies.

now stands at 117. Of these 93 were in Devonshire and 24 in Cornwall. There are also 21 cases still under investigation. The period of quarantine on approved veterinary premises, required for all dogs moved out of those counties to other parts of Great Britain, has been increased from four to six calendar months.

THE following Scale of Compensation is framed by the Board of Agriculture and Fisheries under the powers vested in them by Section

**New Scale of
Compensation for
Guidance in the
Enfranchisement of
Copyholds of
Inheritance.**

66 of the Copyhold Act, 1894, and the Board of Agriculture and Fisheries Acts, 1889 to 1909, for Guidance in the Enfranchisement of Copyholds of Inheritance in substitution for the existing Scale of Compensation:—

1. *Fines Arbitrary.*—In fine arbitrary cases when a fine is payable on alienation by, as well as on the death of, a tenant, the compensation or fines should not exceed the number of years' annual value of the

property according to the age of the tenant as set forth in the table hereto annexed.

2. The table is calculated on the principle that a fine of two years' annual value is payable on each change of tenancy ; therefore, in those manors in which the customary fine on alienation by, or on the death of, a tenant, is less than two years' annual value, a proportionate reduction should be made in the amount of the compensation.

3. In estimating the annual value of the property, no deduction should be made for land tax or landlord's property tax, but the quitrent should be deducted.

Where the net annual value of the property for poor rate assessment is used, as such value is based on the rent payable by a tenant who pays the usual tenant's rates and taxes and the tithe rentcharge, with a deduction from such rent of the probable average annual cost of repairs, insurance and other expenses, if any, necessary to maintain the property in a state to command such rent, no deductions should be made from the net annual value in respect of these matters.

Where the actual rent is used, as the tenant does not pay the tithe rentcharge this should be deducted from the rent, and such other deductions should be made as will arrive at a value based on the same principle as is adopted in the case of the poor rate assessment.

Where tithe rentcharge is deducted in assessing the compensation under the Copyhold Act, 1894, it is usual to deduct the actual value as varied by the septennial average corn prices at the time of the valuation, and not the par amount which appears in the tithe apportionment, and it is immaterial that the lord, or the tenant, is the owner of the tithe rentcharge.

4. When there are facilities for improvement or the land has present or prospective building value, four eighty-ninth parts of the fee simple value may be taken as the annual value.

5. **Fines Certain.**—In fine certain cases when a fine is payable on alienation by, as well as on the death of, a tenant, the compensation for fines may be calculated by multiplying the amount of the fine by one half of the number of years' purchase given in the table according to the age of the tenant.

6. **Reliefs.**—The amount of compensation for a relief may be calculated in like manner as a fine certain.

Herlots.—7. The compensation for a heriot payable on alienation by, as well as on the death of, a tenant, may be calculated by multiplying the value of the heriot by one half of the number of years' purchase given in the table according to the age of the tenant.

8. The value of a heriot may generally be ascertained from the average value of the last three herlots taken or paid in respect of the property to be enfranchised. If that information cannot be obtained, or will not apply, the following circumstances should be taken into consideration in fixing the value of a heriot, namely, the nature of the heriot, the character and value of the property, the condition in life of the tenant, and also whether the heriot can be seized as well without as within the manor.

9. **When Fine or Heriot Payable only on one of the Events of Alienation or Death.**—The table being calculated on the assumption that fines and herlots are payable both on alienation *inter vivos* by a tenant and on his death, when a fine, whether arbitrary or certain, or a heriot, is

payable only on one of those events, then only one half of the compensation calculated as previously directed should be given.

10. When Fine or Heriot Payable on Death of Lord.—In manors in which fines or heriots are payable on the death of the lord, as well as on alienation by, or on the death of, a tenant, the compensation on enfranchisement should be increased according to the nature and amount of the customary fine or heriot payable in the manor on the death of the lord.

11. Quitrents and other Annual Payments.—The compensation for quitrents, free rents, and other annual rents, services, or payment might, as a rule, be calculated at $22\frac{1}{4}$ years' purchase.

12. Timber.—Compensation for timber should be ascertained as follows:—When by a special custom of the manor the lord can enter upon the land, and cut and carry away the timber without the consent of the tenant, its whole value, after making a sufficient allowance for repairs, should be given to the lord. But where there is no special custom, so that the ordinary law of copyholds is applicable and therefore the lord cannot enter and cut without the consent of the tenant, one half only of its value, after making a sufficient allowance for repairs, should be given. If there be any other special custom in the manor relating to timber, such custom should be regarded.

13. Forfeitures, etc.—The compensation for forfeitures, and all other incidents of copyhold tenure not hereinbefore provided for, should not exceed 20 per cent of the annual value of the property. The annual value may be ascertained as in paragraphs 3 and 4.

14. Escheat.—The right of escheat being reserved to the lord under the Copyhold Act, 1894, its value is not to be taken into consideration.

15. When Land held by Joint Tenants or Tenants in Common.—In the case of an enfranchisement by joint tenants, the compensation for fines, and heriots if any, should be based upon such a single life as may be equivalent to the expectation of survivorship of the joint lives; and it is usual to ascertain the age of such single life according to the rules and tables appended to the Succession Duty Act, 1853. In the case of an enfranchisement by coparceners or tenants in common, the share of each tenant should be valued separately, having regard to the age of the tenant, and according to the table annexed.

16. Special Customs or Circumstances.—If there be any special customs of the manor, or special circumstances affecting or relating to the land to be enfranchised, or special advantages to arise from the enfranchisement, they should be taken into consideration, and due allowance should be made in respect of them.

17. Interest.—Interest should be made payable by the agreement or decision on the amount of the compensation at the rate of $4\frac{1}{2}$ per cent. per annum from the date of the notice requiring the enfranchisement to the date of payment of the compensation, unless the compensation is paid by way of an annual rentcharge under the Act.

18. The foregoing scale is for guidance only, and is not binding as a matter of law in any particular case; but the party requiring enfranchisement should, in accordance with the Act, state to the other party whether or no he is willing to adopt the scale.

In witness whereof the Board of Agriculture and Fisheries have set their official seal this third day of January nineteen hundred and nineteen.

L.S.

(Signed)

A. D. HALL, *Secretary.*

In constructing this Table a fine arbitrary on admission has been taken as equivalent to two years' annual value, and whilst the average fine interval has been assumed to be 14 years, regard has been had to the age of the tenant on the rolls.

THE following Notice was issued by the Joint Committee of the Ministry of Food and the Board of Agriculture on 23rd January:—

The Food Controller has appointed a Travelling Commission to make investigations in various parts of Great Britain into the costs of milk production in order to obtain the necessary data for fixing prices after 30th April. The Commission will also consider the possibility of differentiating between the prices fixed

for Milk in various areas. The following are the members of the Commission :—

- C. B. Fisher, Esq., C.B.E., Agricultural Adviser to the Ministry of Food (*Chairman*).
- C. S. Orwin, Esq., Director of the Agricultural Economics Research Institute, Oxford.
- J. Wyllie, Esq., Lecturer on Agriculture and Book-keeping, West of Scotland Agricultural College.
- J. Mackintosh, Esq., Board of Agriculture and Ministry of Food.
- P. Francis, Esq., Board of Agriculture for Scotland.
- M. Macfarlane, Esq., Ministry of Food.
- E. W. Langford, Esq., W. Cumber, Esq., and A. Batchelor, Esq., Central Agricultural Advisory Council.
- Mrs. Cottrell, G. Wilson, Esq., and W. H. Watkins, Esq., Consumers' Council.
- Secretary*—Miss Cowper (Ministry of Food), Room 215, New County Hall, Westminster Bridge Road, S.E. 1.

The Commission will begin its work very shortly, and will visit the areas of Divisional Food Commissioners in order to hear witnesses and consider the evidence.

THE following Circular Letter, No. S. 249/1919, was addressed to Clerks of County Councils and County Boroughs in England and Wales by the Board on 30th January :—

**Redemption of Tithe
Rentcharge, etc., on
Land Acquired or to
be Acquired for
Small Holdings under
the Small Holdings
and Allotments
Act, 1908.**

SIR,—I am directed by the President of the Board of Agriculture and Fisheries to enclose copies of Forms of Application by a landowner* and Instructions* for the redemption of tithe rentcharge, corn rents, and certain other payments in lieu of tithe which have been issued by the Board in connection with the Tithe Act which received the Royal Assent on the 21st November last.

On reference to paragraphs 4 and 5 of the Instructions, it will be observed that under the new Act, the terms for redemption are more favourable to the landowner than was formerly the case, and that the amount of the consideration for redemption in any particular case, depends largely upon the deductions to be made in respect of the rates and land tax and cost of the collection on the tithe rentcharge. It will further be observed that in certain circumstances the consideration may be discharged by an annuity payable yearly or half-yearly for a period not exceeding 50 years. In this connection Sections 3, 4, and 10 of the Act and the First Schedule thereto may be referred to.

Assuming (1) local rates and land tax paid in respect of the tithe rentcharge for the three years immediately preceding the application to redeem to be, say, 5s. 6d. and 3d. in the pound, respectively, (2) an average assessable value for the three years of £63 for each £100 of tithe rentcharge (par value), (3) the cost of collection to be 2 per cent., (4) the rate of interest on the consideration money to be 5 per cent., and (5) that the annual amount to be set aside and invested in order to replace the consideration money at the end of 50 years is to accumulate at 4 per cent. compound interest, the annuity for 50 years required

* Not here printed.

under the Act to discharge the consideration for the redemption of £100 tithe rentcharge (par value) attached to a benefice would be about £104 12s. 5d. The calculation would be as follows :—

Gross Annual Value of £100 tithe rentcharge until 1st January, 1921, as fixed by the First Schedule to the Tithe Act, 1918—

				= £100
Deduct half rate (2s. 9d. in £) on	£	s.	d.	par value.
£66 assessable value ..	=	9	1	6
„ Land Tax (3s. in £) ..	=	0	16	6
„ Cost of Collection (2 per cent. on £100); see First Schedule to Act ..	=	2	0	0
				<hr/>
				11 18 0
Net Annual Value				= £88 2 0

Consideration money = £88 2s. × 21 = £1,850 2s., i.e., approximately 18½ years' purchase of the par value. The amount of the annuity would be ascertained as follows :—

On reference to a 4 per cent. Sinking Fund Table it will be found that .00655 is the multiplier for ascertaining the sum which would be sufficient, if the periodical payments were accumulated at 4 per cent. compound interest, to produce £1,850 2s. at the end of 50 years.

£1,850 2s. × .00655	=	£12	2	4
Add 3 per cent. on £1,850 2s. ..	=	£92	10	1

Therefore Annuity = £104 12 5

The consideration money and the amount of the equivalent annuity in respect of tithe rentcharge not attached to a benefice would be calculated similarly, except that the whole rate (5s. 6d. in the £) instead of the half rate would have to be deducted in arriving at the net annual value of the tithe rentcharge. It would be found that the consideration money for the redemption would be £1,059 10s. 6d. for £100 par value, or just over 16½ years' purchase, and that the equivalent annuity would be £93 16s. 11d. It may be noted that the sum payable under the new Act in respect of every £100 tithe rentcharge which becomes due on or before the 1st January, 1926, is £109 3s. 11d. and that after that date the sum payable is to vary from year to year in accordance with the average prices of wheat, barley and oats for the fifteen preceding years.

The Board would be glad if your Council will arrange to take immediate steps for the redemption, by means of an annuity for a period of fifty years, of all tithe rentcharge and other payments in lieu of tithe to which the Tithe Act, 1918, applies, charged on land purchased by them under the Small Holdings and Allotments Act, 1908. Similarly your Council should arrange to apply for the redemption of any tithe rentcharge charged on lands purchased in the future. In this connection it should be borne in mind that under the Tithe Act, 1918, the Board's power to determine on the sole application of the landowner that the consideration for redemption shall be paid by an annuity only applies to applications made on or before the 1st January, 1921. Moreover, in some instances it will doubtless be found that land purchased for small holdings forms part only of an area charged with tithe rentcharge, so that an altered apportionment will be necessary before an application

for redemption can be lodged. In such cases, application for altered apportionment should be made forthwith. Forms for altered apportionment will be supplied by the Board on request.

I am, etc.,
(Signed) A. D. HALL.

THE following Circular Letters (No. I. 5310/18), dated 8th and 16th January, 1919, respectively, have been addressed to County Councils by the Board on the subject of agricultural education:—

**The Provision of
Agricultural Education
after the War.**

SIR,—1. The close of hostilities, the approaching end of the War, and the period of general reconstruction which must follow in agriculture as in the other foundations of the national life, make it necessary to consider in detail the arrangements for restoring and extending the county system of agricultural education, which was arising when the outbreak of war largely suspended the activities of the Board and all Local Authorities in that direction.

2. Your Authority will, of course, remember that this whole question of agricultural education was examined by the Agricultural Policy Sub-Committee of the Reconstruction Committee, who recommended that the entire cost and responsibility should be transferred from the Local Authorities to this Board. Mr. Prothero has carefully considered this recommendation, but has come to the conclusion, for reasons which need not be here discussed, that he cannot advise His Majesty's Government to accept and act on it.

3. On the Local Authorities, therefore, will continue to fall the primary responsibility for providing and working that improved system of agricultural education throughout the country which must be one of the principal sources of agricultural progress. He need scarcely say that all the assistance and advice which it is in the power of the Board to give will be freely placed at the disposal of the Local Authorities. In particular, the question of financial aid will naturally and properly occur to your Authority as one of which a settlement is required; and he desires me to say at once that he has already put before His Majesty's Treasury proposals for increasing the annual grants paid to Local Authorities by this Department, and simplifying the regulations which govern their amount. If these proposals are accepted you will be at once informed; and meanwhile your Authority will perhaps proceed on the assumption that this Department are aware of the necessity of placing on a simpler and more adequate basis the financial aid provided from the Exchequer.

4. He realises that at the present moment the depleted staffs of Local Authorities and the pressure of urgent work of an emergency character make it difficult for them to give the necessary time and thought to the task of drawing up for their area a considered and comprehensive scheme of agricultural education. Again, it is not possible to determine the precise effects of the provisions of the Education Act, 1918, dealing with continuation schools, nor the extent to which agricultural instruction in the counties may be temporarily deflected from its normal working by the necessity of providing it in some form or other for perhaps a large number of unskilled men desiring to settle on the land after serving in His Majesty's Forces. In spite, however, of such difficulties, Mr. Prothero feels that the time has

come when preliminary steps should be taken towards creating an improved and extended system. Such a system cannot be imposed from Headquarters ; it must be built up from local foundations.

5. I am, therefore, to ask that as soon as possible your Authority would proceed to prepare a comprehensive scheme of agricultural education for your area (consulting, of course, with the Agricultural College for the Province, if any, and with neighbouring Local Authorities so far as desirable) and forward it for Mr. Prothero's consideration. The following few remarks are designed for the guidance of your Authority in drawing up such a scheme.

6. As regards form, the Board suggest that the scheme might be framed under the following heads :—

“ Proposals for the development of a comprehensive system of agricultural education in the county of by means of :

- (a) “ The establishment and maintenance, or contributions towards the establishment and maintenance, of an institution for higher agricultural education.
- (b) “ The provision of a county staff of agricultural instructors, including particularly the appointment of an ‘ Agricultural Organiser.’
- (c) “ The establishment and maintenance, or contribution towards the establishment and maintenance, of a farm institute or farm school.
- (d) “ The provision of technical advice for farmers.
- (e) “ The provision of regular short courses of instruction at an approved centre or centres.
- (f) “ The provision of local courses, lectures, practical demonstrations, etc., through the agency of the County Agricultural Staff or otherwise.
- (g) “ Any other means.”

7. As regards the substance of the scheme the Board at present desire to draw attention only to three matters to which they attach great and permanent importance.

8. The first is the appointment of an Agricultural Organiser of high standing and ability for every county (or group of counties) where such an officer is not already in existence. His duties and responsibilities would be, shortly, to supervise all the agricultural work done by the county or counties employing him. He might give some instruction, but his main function would be to act as an Organising Head of the county staff and the mainspring of their activities. The Board regard the appointment of a thoroughly competent man to fill this post as of such importance that they have asked His Majesty's Treasury for funds to allow them to pay to Local Authorities a specially high proportion of his salary and expenses.

9. The second is the provision by a county or groups of counties of a Farm Institute, where not already in existence—an institution which in addition to supplying courses of instruction of a type suitable to the district (and particularly winter courses for young agriculturists), also serves as a headquarters for instructors in agricultural subjects employed by the county or group of counties providing the Institute. It is contemplated that there should be attached to the Institute agricultural land on which demonstrations can be conducted of the science and practice of the industry. Effective teaching must largely depend on the extent to which it is possible to illustrate scientific principles and

demonstrate practice in the fields and homestead ; and for this reason alone it is desirable to provide instruction at a permanent centre where a sufficient area of agricultural land is available for demonstration. But a farm institute performs another most useful function. As the headquarters of the County Instructors, who co-operate in its activities, it provides them with the means of keeping in constant touch with actual farm practice, of associating themselves with farming operations, of adding to their knowledge by experiments carried out under favourable conditions, and of testing the advice which in one of their functions they are called on to furnish to farmers.

10. The strength of a farm institute staff will be dependent on the size and importance of the area served, but the following may perhaps be taken as normally representing the staff desirable for carrying on, with the fullest efficiency, the work of a farm institute.

Whole-time Officers :

Principal and Chief Instructor in agriculture.
Vice-Principal and Assistant Instructor in agriculture.
Instructor in general science.
Instructor in dairying.
Instructor in poultry-keeping.
Instructor in horticulture.
Matron and Instructress in domestic economy.

Part-time Officers :

Instructor in veterinary science.
Instructor in wood work.
Instructor in iron work.

The Principal (who ordinarily will be the County Agricultural Organiser) and the Assistant Instructor in agriculture must live at the Institute, and their work should be so arranged that they are absent on county work in turn. The remainder of the full-time staff should be required to reside at or near the Institute. In order that the teaching at the Institute may be efficiently linked with the miscellaneous itinerant instruction it is important that every member of the whole-time staff should take part in outside work.

11. Your Authority will remember that, under the existing Regulations, grants may be made up to 75 per cent. of the total approved cost of providing, improving or extending a farm institute. The approved cost may include the cost of equipment (but not agricultural land attached to an institute, for which separate provision is made). The Board do not contemplate any change in the Regulations in this respect.

12. The third matter to which I am to draw special attention is the necessity of fixing for county staffs salaries adequate to attract and retain the services of thoroughly competent men and women. Mr. Prothero feels that he need not emphasise this point ; but it may perhaps be added that in his opinion the general range of salaries is bound, for some time to come and perhaps permanently, to be appreciably higher than before the War.

13. Mr. Prothero hopes that even in the midst of other matters of pressing importance your Authority will be able to devote the necessary time and labour to the task of framing a really comprehensive and satisfactory scheme of agricultural education for your County ; he is sure that no labour will be better repaid than that spent in devising such a scheme and bringing it into operation. He has specially deputed

Sir Thomas Middleton, Deputy Director-General of the Food Production Department and an Assistant Secretary to the Board, to visit and confer with any Local Authorities who may desire the Board's help in framing their schemes ; and he trusts that your Authority will have no hesitation in arranging for a meeting with Sir Thomas to discuss any points of difficulty.

I am, etc.,
(Signed) A. D. HALL,
Secretary.

SIR,—I am directed by the President of the Board of Agriculture and Fisheries to inform you, in continuation of the Circular Letter addressed to you on the 8th instant under the above number, that he has now received the sanction of the Lords Commissioners of His Majesty's Treasury to the proposals alluded to in the third paragraph for increasing the annual grants payable by this Department to Local Education Authorities in aid of the provision of agricultural education and for simplifying the Regulations under which those grants have hitherto been paid.

Steps are being taken to embody the new system in a revised edition of the Regulations, which will be issued as soon as possible ; but in the meantime it will be of assistance to your Authority, in drawing up the scheme which you have been invited to submit, to learn that the Board have been authorised to pay grants to cover 80 per cent. of the salaries and expenses of duly qualified Agricultural Organisers and, in general, two-thirds of the approved expenditure on other items. At the same time the deductions hitherto made in paying grants under paragraphs 22-23 of the Regulations, in respect of the share of the Residue Grant assumed to be attributable to agricultural education will no longer be taken into consideration (the whole of that grant being regarded as attributable to higher education other than agricultural), so that Authorities will be in a position to estimate in advance with reasonable accuracy the actual amount of aid on which they can count. The result of these changes will be (with effect from the ensuing financial year) very largely to increase the rate at which grants have hitherto been payable. In some cases the existing grants (on the basis of present expenditure) would be more than doubled in the aggregate and in a few cases the increase may be even greater.

I am to express the hope that this notification will enable your Authority to proceed at once with the preparation of a suitable scheme.

I am, etc.,
(Signed) A. D. HALL,
Secretary.

THE Village Clubs Association* has prepared a set of draft rules for adoption by any village club which may be established on the lines adopted by the Association. A copy of the

**The Village Clubs
Association.**

suggested rules may be obtained by any person interested on application to either of the Honorary Secretaries of the Association :
Mr. A. Goddard, C.B.E., 12, Great George Street, Westminster, S.W. 1,
and Mr. George Dallas, 32, Charing Cross, S.W. 1.

* See this *Journal*, September, 1918, p. 621.

THE article entitled "Potato Growing on Waste Land in Dorset," published on p. 1173 of the January issue of this *Journal*, was contributed by Mr. R. W. Ascroft, M.B.E., F.L.S.

**Potato Growing
in Dorset.**

In printing the article, the name of the author was omitted owing to a misunderstanding. The photographs illustrating the work of German prisoners were reproduced by special permission of the Military authorities.

**A Successful Method
of Growing Heavy
Crops of Wheat:
A Correction.**

ON p. 1165 of this *Journal*, January, 1919, in the article "A Successful Method of Growing Heavy Crops of Wheat," the dimensions of Field III. were given as 1,030 links by 365 links. The latter dimension should have read 345 links.

At a meeting of the Agricultural Wages Board, held on the 9th January, the Board expressed themselves strongly in favour of the complete demobilisation of all agricultural workers at the very earliest possible moment and the removal thereupon of all prisoner labour from the land.

**Proceedings of the
Agricultural Wages
Board.**

The Board authorised the institution of legal proceedings against an employer for non-payment of the minimum rates, and took steps to expedite the institution of proceedings in other suitable cases. They also expressed their intention of prosecuting in any case in which an employer dismissed or threatened to dismiss a worker as a result of action taken to secure payment of the minimum rates or the payment of arrears of wages.

THE minimum rates of wages for agricultural workers, as fixed by the Agricultural Wages Board, are not published in this *Journal* owing to considerations of space. Tables of minimum rates in force for male workers appeared in the issue of the *Wages Board Gazette* for the 14th December, 1918, and for female workers generally, and those special for Northumberland, in the *Wages Board Gazette* for 1st November, 1918. Any changes or new rates which may be made from time to time will be duly noted in subsequent issues of the *Gazette*. Copies of the *Wages Board Gazette* may be obtained from the Office of the Agricultural Wages Board, 80, Pall Mall, London, S.W. 1, Price 1d. per copy (post free 1½d.).

**Minimum Rates of
Wages for Agricultural
Workers.**

Lichfield.—William Peace, Home Farm, Efford, was summoned for having permitted wheat to become damaged. Of 22 sacks of wheat which stood on straw in defendant's rick yard, and were merely covered with an ordinary rick sheet and a few battens, three had become damp and the contents musty, while 19 were found upside down with the bottoms of the sacks wet. In a shed, of 25 sacks of wheat stacked on a lorry, only three or four were in good

**Prosecutions of
Farmers, etc., under
Statutory Rules
and Orders.**

condition; and in another shed where 22 sacks were stacked fowls had been feeding on the wheat, which had become mouldy, damp and caked. Defendant was fined £20 in respect of these offences, and a further £20 for keeping deposited wheat seeds without previously having had a sample taken and tested. (*National Food Journal*, 11th December, 1918.)

Barrow.—William Bowes, a farmer, was fined £25 with 5 gs. costs, on each of two summonses, for failing to deliver milk to a certain retailer as ordered by the Ministry of Food Commission for the north-western area.

Bristol.—Reginald James Hoddinott, a dairyman, was fined £30 for obstructing an inspector and wasting 2 gal. of milk. (*National Food Journal*, 25th December, 1918.)

MISCELLANEOUS NOTES.

THE *International Crop Report and Agricultural Statistics* for January, 1919, published by the International Institute of Agriculture, gives

Notes on Crop Prospects Abroad.

particulars concerning the production of the cereal crops of 1918 in certain countries in the Northern Hemisphere. *Wheat*.—The production in Denmark, Spain, United Kingdom, Italy, Luxemburg, Netherlands, Sweden, Switzerland, Canada, United States, British India, Japan, Egypt, and Tunis is estimated, at 251,685,000 qr. in 1918, against 212,531,000 qr. in 1917, or an increase of 18·4 per cent. *Rye*.—The estimated production in Denmark, Spain, Ireland, Italy, Luxemburg, Netherlands, Sweden, Switzerland, Canada, and United States is placed at 21,639,000 qr. in 1918, or an increase of 41·6 per cent. compared with 1917, when it amounted to 15,279,000 qr. *Barley*.—The production in Denmark, Spain, United Kingdom, Italy, Luxemburg, Netherlands, Sweden, Switzerland, Canada, United States, Japan, Egypt, and Tunis is estimated to amount to 76,418,000 qr. in 1918, against 67,119,000 qr. in 1917, or an increase of 13·9 per cent. *Oats*.—It is estimated that the total yield in Denmark, Spain, United Kingdom, Italy, Luxemburg, Netherlands, Sweden, Switzerland, Canada, United States, Japan, and Tunis amounts to 261,707,000 qr. in 1918, against 253,940,000 qr. in 1917, or an increase of 3·1 per cent. *Maize*.—The production in Spain, Italy, Switzerland, Canada, United States, and Japan is estimated at 313,175,000 qr. in 1918, against 382,094,000 qr. in 1917, or a decrease of 18·0 per cent.

Sowing of Winter Cereals in the Northern Hemisphere.—The areas estimated to have been sown with winter *wheat* in 1918-19, compared with the areas sown during the corresponding period of 1917-18, expressed as percentages, are as follows:—England and Wales 96, Canada 95, United States 117; with *rye*: England and Wales 95, United States 111; with *barley*: England and Wales 97; with *oats*: England and Wales 98.

France.—An official report giving crop conditions on the 1st January states that the weather has been colder with some frosts, and accordingly the position of the young crops is considered to be distinctly better.

The appearance of the new rye crop is reported to be good, although the growth of the plant is somewhat excessive for the time of the year (*Broomhall's Corn Trade News*, 25th January, 1919.)

India.—According to the preliminary estimate, the area sown with wheat in 1918-19 is 23,472,000 acres, as compared with 33,912,000 acres, the first estimate for 1917-18, and the final estimate of 35,497,000 acres. The condition of the crop in the North-West Frontier Province is below average; in the Punjab on irrigated land average, on un-irrigated, much below average; in the United Provinces on irrigated land fair to good, but elsewhere uncertain; and in Bengal poor. The area sown with rape and mustard, as reported up to date, is estimated at 2,950,000 acres as against 3,828,000 acres in 1917-18, and that sown with linseed at 2,002,000 acres as against 2,817,000 acres. (*The London Grain, Seed and Oil Reporter*, 4th and 14th February, 1919.)

South Africa.—According to an official report dated 14th December the wheat crop on 30th November was estimated at 1,070,000 qr., or 2 per cent. less than the record year of 1917, and sufficient for 8 or 9 months' normal consumption. Oats and barley are still reported to be below the normal, the former by 5 and the latter by 11 per cent., whilst the acreage is 4 to 5 per cent. less than in 1917. (*Broomhall's Corn Trade News*, 31st January, 1919.)

THE Crop Reporters of the Board, in reporting on the agricultural position on 1st February, state that the continual rains, followed by

**Agricultural
Conditions in England
and Wales
on 1st February.**

work much during January. Fair progress was made on light land, and the last few days of the month gave opportunity for carting manure in some districts, but otherwise work is distinctly behindhand. Wheat appears to have suffered somewhat on very heavy or wet land, but is elsewhere satisfactory; autumn-sown oats and beans seem to be a good strong plant almost everywhere.

The condition of ewes is reported as fair to good, the wet weather having proved trying. Lambing prospects are considered fairly satisfactory on the whole. The Dorset Horn flocks have practically finished lambing: the fall of lambs is reported as moderate, but the mortality light.

Live stock are generally in fair condition. In most parts of the country, but not all, the supply of winter keep is rather short.

The steady demobilisation of agricultural labourers from the Army is relieving the scarcity of farm hands, and in several parts of the country the supply has been nearly, if not quite, sufficient for the requirements of a wet month. Skilled labour is, however, still scarce. Owing to the lateness of the season, and the deficiency of labour, proper cultivation in the autumn was frequently neglected, and it is expected that the preparation of the land for the spring crops will require more labour than usual.

THE following local summaries give further details regarding agricultural conditions in the different districts of England and Wales :—

**Agricultural
Labour in
England and Wales
during January.**

Northumberland, Durham, Cumberland and Westmorland.—Owing to the return of demobilised men, the labour situation is easier in many districts, but the supply is still well below requirements. In some parts

a considerable increase in the amount of work required to prepare the land for green crops is anticipated, but in one or two districts it is not expected that much extra labour will be required.

Lancashire and Cheshire.—There is on the whole a deficiency of labour, but in some cases there is enough for present needs. Farm hands are gradually returning from the Army. It is anticipated that more labour will be required shortly owing to the accumulation of work on the farms, little autumn cultivation having been done.

Yorkshire.—Skilled men are still scarce, but there is no marked deficiency of labour, and the supply in some districts is improving. It is generally anticipated that more labour than usual will be required in the spring owing to ploughing being late and a good deal of land being very foul, but much depends on the weather.

Shropshire and Stafford.—The supply of labour is improving, but still deficient, skilled men being particularly scarce. Generally it is anticipated that much more labour than usual will be required in the spring to prepare the land for green crops.

Derby, Nottingham, Leicester, and Rutland.—The supply of labour is still deficient, though in some districts the situation has improved. Generally it is anticipated that more labour than usual will be required in preparing for green crops, owing to the land being abnormally foul.

Lincoln and Norfolk.—The supply of labour shows further signs of improvement, and occasionally it is sufficient for requirements, but there is still a deficiency in most parts. In the majority of districts it is anticipated that there will be an increase in the work of preparing the land for green crops, there being much foul land.

Suffolk, Cambridge, and Huntingdon.—The supply is generally deficient, and, in some cases, very short, but the situation has not been acute owing to work being retarded by the wet weather. The preparation of the land for green crops is backward, and extra labour will be required for this work.

Bedford, Northampton, and Warwick.—Labour is generally sufficient, but there are occasional complaints as to a deficiency of skilled men. In Bedford and Warwick there is much land in a foul condition, and increased work in the preparation of the land for green crops is anticipated.

Buckingham, Oxford, and Berkshire.—The supply of labour, though sufficient in many districts, is short in others, especially as regards skilled men, but the situation generally appears to be improving. In many places, owing to the late harvest and wet autumn, the cleaning of land is very backward, and a considerable increase of work is anticipated to prepare the land for green crops in the spring.

Worcester, Hereford, and Gloucester.—The supply of labour is sufficient for present needs and men are gradually coming back from the Army. In some districts, owing to much foul land needing to be cleaned, extra labour will be required in preparing for green crops next spring, but in other districts this is not anticipated.

Cornwall, Devon, and Somerset.—The demobilisation of agricultural workers is improving the labour position, though the shortage of skilled men continues. Considerable extra work will be needed in preparation for green crops next spring.

Dorset, Wiltshire, and Hampshire.—Labour remains scarce, but the weather of the past month has reduced the demand for the time, and the release of men from the Army is making itself felt. Considerable extra labour will be needed to prepare for spring crops.

Surrey, Kent, and Sussex.—There is little change in the supply of labour, it being still short, skilled men being particularly scarce. The work of preparing the land for green crops will probably be heavier than usual.

Essex, Hertford, and Middlesex.—The position is somewhat easier in most districts, though in a few places the supply is deficient. Owing to cultivation being backward a large increase of work is expected in the spring in preparing the land for green crops.

North Wales.—Skilled men are scarce, but the situation is being eased in some cases by the gradual return of men from the Army, and the supply is about sufficient for the requirements under present weather conditions. In some districts more labour than usual will be required in the spring as cultivation is backward and a certain extent of land was left uncleaned in the autumn, but in other districts no such increase is anticipated.

Mid-Wales.—The release of men from the Army is easing the situation, but in some districts there is still a shortage of labour. In most parts an increase in the work of preparing the ground for green crops is expected, the land, in many cases, being in a foul condition, but the employment of tractors is likely to ease the labour situation.

South Wales.—Labour is still deficient in most districts. Generally extra work in preparing the land for green crops is anticipated.

* Estimated carcass weight.

NOTE.—The prices per lb. for sheep do not include the value of the skins, which during January made prices equivalent to an additional 1½d. per lb. of the carcass weight for Downs, Longwools, Cheviots, and Cross-breds, and 1½d. for Blackfaced and Welsh, and during December, 1½d. per lb. for Downs and Cross-breds, 1½d. for Longwools, and 1½d. for Cheviots, Blackfaced and Welsh.

In addition to the price quoted above for sheep per lb., sellers were entitled, under the Live Stock (Sales) Order, 1918, to charge an extra amount ranging from 1s. 6d. to 5s. per head during January, and 1s. to 3s. 4d. during December, according to the weight of the sheep.

THE JOURNAL OF THE BOARD OF AGRICULTURE

Vol. XXV. No. 12.

MARCH, 1919.

EDITORIAL NOTES.

IN the last issue of this *Journal* there appeared (p. 1389) two Circular Letters addressed to the Local Education Authorities on the subject of schemes for promoting Agricultural Education in rural areas.

Agricultural Education.

Now that hostilities have ceased it is most important that attention should be given to the reconstruction of agricultural education, particularly in view of the interest in home food production which the War has awakened. It is, therefore, very gratifying to be able to announce that Treasury sanction has been obtained for the provision of grants on a much more liberal scale than heretofore. Briefly, it may be said that to every pound provided by a Local Authority the State will now add at least two pounds. This goes far towards meeting the demands put forward by the Agricultural Policy Sub-Committee, while at the same time preserving the present organisation of local government in educational matters which that Committee proposed to weaken.

There is now no reason why every county should not have an Agricultural Organiser—a type of officer whose worth has been abundantly proved during the War. It may also be hoped that a great increase in the number of Farm Schools or Institutes will now take place.

* * * * *

STRICTLY speaking, weeds should be attacked all the year round, at any time and in every place where they are trouble-

Weeds.

some or are likely to prove a source of infestation to arable or grass land. Yet there are periods when weeds are more vulnerable than at others, and one of these periods is the early spring time, when dormant embryos burst through the seed cases and seedlings push their way through the soil to seek the invigorating influence of sunlight and to absorb carbon from the air in the process of photosynthesis—or “growth.” At the same time biennial and perennial roots renew their life, and strong stems (as in the case of thistles and docks) or slender growths (as

THE REMOVAL OF HEDGEROWS.

A WORK FOR DEMOBILISED SOLDIERS.

BERNARD N. WALE, B.Sc.,

Principal, Seale-Hayne College.

IN the Report of the Agricultural Policy Sub-Committee,* Sir Sydney Olivier, K.C.M.G., and Sir Thomas Middleton, K.B.E., made the following statement:—

“For the purpose of increasing the national food supply, land already in hand has the great advantage over ‘waste’ land, in that it is largely already capitalised, and more important still is already equipped and provided with a trained directing staff; the whole of such a staff would have to be provided for added land. An increase of 1 acre in 20 in every farm in England and Wales—requiring in each case a trifling effort of the farmer—would add 550,000 acres to the total under the plough.”

The following article purports to show how such an increment of land could be obtained by the removal of hedgerows where they are already too numerous, by which means a great increase of cultivable land could be secured. At the same time the productive capacity of the adjacent lands would be materially improved, and all future cultural operations greatly reduced in cost.

It seems to be very tardily recognised that fields which were suitable as regards their size for the agriculture of a couple of centuries ago—when the sickle was used to reap the corn and the pack-horse to carry it away—are distinctly unsuitable and uneconomic at the present time.

With the appearance of the drill, the manure distributor, the self-binding harvester, and, more recently, the motor tractor, there has seldom been any corresponding increase in the size of the fields; so that it is quite common to find arable fields of two acres or less (especially in the West of England) being cultivated by implements very similar to those which it is customary to use on the open prairie lands of America. The merest tyro will see that such tillage must be very expensive by being so “cribbed, cabined and confined.” Fields, therefore, should be enlarged, and excessively wide hedgerows reduced to reasonable limits, so that the utmost can be obtained

* Report of the Agricultural Policy Sub-Committee of the Reconstruction Committee, 1918. (Cd. 9079, 1918.) Published by His Majesty's Stationery Office.

from a given area of land, and adequate scope afforded to the newer type of cultivation referred to.

The details given below show how widespread is the evil of small enclosures and how great the loss in acreage which the present fences entail.

The Existence of Small Enclosures and Numerous Hedgerows.—From the literature consulted, reference may be made to the following:—

1796. Marshall* describes the fences of Devonshire thus:

"Nothing marks the rural management of this extremity of the island more strongly than the construction of its farm fences. The bank or foundation of a Devonshire hedge is a mound of earth, eight, ten or more feet wide at the base and sometimes nearly as much in height; narrowing to 6, 7 or more feet wide at the top which is covered with coppice woods, as oak ash, willow, birch, hazel. These are cut as coppice wood at 15 or 20 years' growth, and at more perhaps than 20 ft. high, besides the height of the mound, together forming a barrier perhaps 30 ft. in height. . . . It appears to me most probable that these coppice fences were adopted to supply fuel . . . Many farms have no other woodland, nor supply of fuel than what their fences furnish. . . . Hedgewood is looked up to as a crop, and is profitable as such, besides the benefit received from the mounds and stubs as fences. The age of most of these fences is great beyond memory, . . . and whether, upon the whole (the fence) under consideration is preferable to the ordinary live hedge of the kingdom, I will not attempt to decide . . . to an invading army they would be most embarrassing: an extent of country intersected by such barriers would be in effect one immense fortification."

Marshall speaks elsewhere† of the fences found in Devonshire as the "Danmonian fence."

1844. Grant‡ when writing on the Hedges and Enclosures of Devon, commences with this pertinent remark:—"Every practical farmer coming into Devon for the first time is struck with the fertility of the soil and the genial climate, . . . but he is astonished at the small quantity of produce of the soil returned per acre. . . .

"No great improvement in farming," he continues, "is possible while hedges are so many and so large, so that upwards of 7 per cent. of the land is occupied by them. For nearly a ridge wide on either side of this bank the corn is hardly worth reaping."

Grant made a survey of a district within a circuit of 15 miles of Exeter, embracing the parishes of Iluxham, St. George's Clyst, Rewe, Polnamore, Clithydon, Feniton, Talaton, Silverton, Broadclyst, and Crediton, which vary in area from about 700 to 9,000 acres each, forming a total of nearly 37,000 acres. "No enclosure is considered

* *Rural Economy of the West of England*, Marshall, 1796, p. 65. 66 and 69.

† *Ibid.*, p. 288.

‡ *Journal of the Royal Agric. Soc. England*, Vol. V, 1844, pp. 420 *et seq.*

unless it be in arable, pasture, or orchard, all coppice woods and plantations being omitted." The tithe apportionments constitute the surveyor's authority.

The result of Grant's survey of 36,076 acres shows that this acreage was divided up into 7,997 fields. Further details are given in the Table below :—

Number of Fields.	Size Varying between	Total Acres.	Approximate Percentage of Land Occupied by Fields of Various Sizes.
805	$\frac{1}{2}$ and 1 acre	704	1.9
1,347	1 .. 2 acres	2,357	6.4
1,293	2 .. 3 ..	3,771	10.0
1,220	3 .. 4 ..	4,981	13.5
1,015	4 .. 5 ..	5,328	14.5
743	5 .. 6 ..	4,767	13.0
511	6 .. 7 ..	3,875	10.5
357	7 .. 8 ..	3,258	8.5
231	8 .. 9 ..	2,200	6.2
148	9 .. 10 ..	1,640	4.5
327	Over 10 acres each.	4,005	10.6
Total 7,997		36,076	

It will be seen that approximately 5,680 fields or 46 per cent. of the total acreage was divided up into fields of 5 acres or less, leaving 2,317 fields, or 54 per cent. in fields of more than 5 acres in extent.

Grant goes on to say that "in the parish of Broadclyst the hedges would make a bank of earth between the capitals of England and Scotland. In the parish of Crediton the hedges would more than extend from Land's End through the centre of England to Edinburgh in Scotland."

In these 37,000 acres he calculates "there are 1,650 miles of hedge" (that is one mile of fence to every 22 acres) "about half as long again as the famous wall of China, and sufficient to hedge round the whole of England with an immense bank of earth and occupying 2,640 acres." He also states that, as the result of his investigation, "805, or 10 per cent. in every 100 enclosures, are between half and two acres."

Grant returns to the subject again in the following issue* and gives a further example in Devon of an estate of 258 acres divided up into 97 enclosures (averaging 2.66 acres each). He estimates that there are 28 acres of hedges and waste of which 20 acres of the former might be saved.

1845. Grigor, "On Fences," says† "In a country like Britain so celebrated for its advanced position in Agriculture, it appears almost anomalous that it should have so long retained such an evil as its overgrown and cumbrous hedges," and "No part of our rural economy is so susceptible of improvement as the fences of England."

1850. Sir Thomas Acland, writing on "The Farming of Somerset,"‡ refers to the loss in that county resulting from its superabundance and excessive width of hedgerows.

1860. Mechi, on "A trip to North Devon,"§ wrote:—"The most striking mechanical deformity is the miserably small dimensions of the

* *Journal, R.A.S.E.*, 1845, p. 246. † *Journal, R.A.S.E.*, 1845, p. 194.

‡ *Journal, R.A.S.E.*, 1850, p. 748.

§ "How to Farm Profitably." Mechi, 1860, p. 77

fields. From $\frac{1}{2}$ to $2\frac{1}{2}$ acres is a common size. No doubt, in a primitive pastoral county without other shelter for stock, such enclosures were once found needful, but they must now give way to the introduction of a different system." He then goes on to describe the then Lord Fortescue's improvements, stating how this landowner converted 72 fields whose total area was 126 acres (an average of 1.75 acres each) into 12 enclosures of about 10 acres each.

1885. Darby, on the "Agriculture of Glamorganshire,"* writes:— "At St. Fagans, journeying from Ely, the tourist first becomes acquainted with these wretchedly small fields with straggling fences that form such a prominent feature of the entire stretch of country between the feet of the Welsh mountains and the Lias Vale."

He goes on to say that the evil is far worse in the Llantrissant and Pencoed districts, and quotes a paragraph written in 1872 on the Report of the Farm Prize Competition, which reads:—"In Wales, miles of huge banks from 6 to 10 ft. wide and topped it may be with a few briars and scattered quicks—intended as a division between small and irregularly-shaped fields, but rather providing for snug nurseries of all manner of filth—might well be dispensed with . . . the fences are crooked, broken down and three times too wide."

1890. In the Report of the Prize Farms (Devon),† in which Newtake Farm, Staverton (the 3rd Prize Farm) is described as consisting of 90 fields totalling 300 acres or $\frac{1}{3}$ acres per field, it is stated that there are 10 miles of fences bounding these fields without counting $\frac{1}{2}$ miles of boundary and road fences, and in the Report on "Farming in Devon and Cornwall,"‡ appearing in the same issue, the statement runs:—"Devon is well known as the land of small enclosures . . . many instances were noticeable of adjoining fields of two to three acres apiece, on the same farm, being under the same crop, where the division fences could be spared without the slightest interference with the cropping, or to the prejudice of the grazing of the seeds."

In 1914, Sir A. D. Hall used these words in connection with his description of Devonshire farming§:—"Trees are also very much in evidence, for the small fields are divided by huge banks faced with stones, which generally carry on the top a line of hedgerow timber 20 or 30 ft high."

Parish.	No. of Fields.	Total acres Surveyed.	Average acreage of each Field.
Shaldon, etc.	355	1,168	3.29

|| See footnote (†) p. 1409.

1918. During last year the writer made a survey of the following parishes: Shaldon, Stoke-in-Teignhead, Haccombe, Kingsteignton, Bishopsteignton, Dawlish, Highweek, Ideford, and Ogwell, all in the neighbourhood of Newton Abbot, South Devon. The results are shown in tabular form on the previous page.

Summarising the two sets of figures (which are remarkably similar in detail), the results show that in a survey of 48,630 acres there are actually 10,630 enclosures, or the fields average approximately $4\frac{1}{2}$ acres each.

The Origin of Small Enclosures.—It is necessary to realise that in very early times the countryside showed no division into fields as they are known to-day. The land which had been reclaimed from the waste or forest was open and unenclosed, except that lying immediately around the village, where in time each occupier enclosed a small patch of land in which to retain his cattle at night and in very severe weather.

Two or three hundred years ago there appear to have been two main types of primitive agriculture prevalent in England and Wales.

First the open-field system, which obtained principally in the Midland and Eastern counties. Corn growing seems to have been the chief characteristic of this type. The land was generally held under the lord of the manor, the rent being paid in the form of money, kind and service.

The arable land of the village or township was generally in two and sometimes three huge fields. Each occupier, instead of having the whole of his holding in a compact block in one of these large fields, held it scattered about in acre or half-acre strips, so that a man farming, say 30 acres (which at one time appeared to be the normal holding) would occupy from 10 to 20 of these parcels in each of the township's two or three large fields. When there were three of these fields, one-third of the land was sown with wheat, one-third with spring corn, and the remainder was fallow, and after harvest each owner's cattle were allowed to graze in common over the stubble of all the occupiers.

Towards the end of the Eighteenth Century and early in the Nineteenth Century, various Acts of Inclosure were passed by Parliament, with the result that these lands were thrown together into compact holdings, although prior to this consolidation of the holdings and enclosure by mutual agreement had to some extent been carried out. White-thorn fences were planted by the tenant to form fields as we now know them.

The *second* type, which was prevalent in Wales, the Celtic fringe generally, and also in Devon and Cornwall, appears to have had none, or very little, of the open field in its constitution, and the land, instead of being held under the lord of the manor, was owned by the chief of the tribe, the tribes forming hamlets or smaller communities than those of the village type. Here the land appears to have been chiefly used for stock raising and the production of wool. Although at first there was community of grazing rights, as in the type first mentioned, it early became recognised that fences were necessary to keep the stock within bounds, and also that when land was enclosed there was greater incentive for the occupier to clean, improve and manure it by depasturing his stock upon it. Apparently much land in these districts during the Sixteenth and Seventeenth Centuries became enclosed. Perhaps, also, the chief of the tribe allowed his tenants to enclose direct from the waste or forest, when the latter desired to extend their holdings. Now this type of enclosing, direct from the waste at will, and without any preconceived plan as to where cart tracks or roads would subsequently be required, naturally would not be so systematic even as the enclosures which took place by Act of Parliament two or three centuries later in the open-field system of the Midlands.

It was the day of small things altogether. The occupier was mostly concerned in providing sufficient food for himself and his dependents and not farming with the idea of amassing wealth

Gonner* terms such enclosures "ancient enclosures" and he says that ancient enclosures are small and irregular, and a few curved. He also states that there are certain tests though not necessarily invariable tests of early enclosure—

1. Irregular and small fields.;
2. Hedges often more thickly filled with trees;
3. High banks are regarded by some as an indication of this;

and later that there was much enclosure from the wild state, especially in the West.

The above thus explains why the fields are so much smaller in the south-west—where the tribal system was prevalent and enclosure took place in very early times—than those found in the midland and eastern counties, where enclosure did not take place until comparatively recently

* "Common Land and Enclosure," E. C. K. Gonner, 1912. The reader is also referred to the following works on Enclosure, "The English Village Community," F. Seebohm, 1883. "English Field Systems," Gray, Harvard University Press, 1915.

The Loss of Ground where Numerous Fields are Enclosed by Wide Hedges.—Marshall, 1796* (already quoted), says:—"Taking into account the quantity of ground these fences occupy and injure by their drip and shade, and by the soil used in their formation, 25 ft. is the least that can be reckoned for the width of waste."

Grant† calculates that the land lost in the district he surveyed, due to the fences, is $7\frac{1}{2}$ per cent., and from other data he gives, it may be calculated that the average width of the fences he dealt with was 13.2 ft., and although this suggests exaggeration, the following facts show that Grant was not overstating the case.

Grant, by actual measurement, found that the percentage of loss of area owing to the hedges (13.2 ft. wide) with different-sized fields was as follows:—

Size of Field.						Per cent. Loss.
Between $\frac{1}{2}$ and 1 acre	17
" 1 " 2 acres	12
" 2 " 3 "	10
" 3 " 4 "	$7\frac{1}{2}$
Over 10 acres	4

With fields, therefore, of 10 acres in area, the loss is only about half of what it is with 3-acre fields. Grant summarised his investigations by the remark that he found "the hedges in the 10 parishes to occupy 7 per cent., and that these shade and injure at least half as much, say 10 per cent. in all. There is no reason for farms even so small as 100 acres to lose more than 1 per cent. by its hedges."

Grant in his subsequent article‡ says:—"The hedge on the south side of the estate (258 acres) is for some distance more than 2 perches (33 ft.) wide, while the parish roads in general do not average one perch."

Grigor§ gives the average width of fence in Norfolk as 10 ft., and refers to one near Norwich as being 13 ft. wide. In Devon he had noticed some of the fences occupying more than a perch ($16\frac{1}{2}$ ft.), the percentage of the land thus occupied being 8 to $8\frac{1}{2}$. He sums up by saying that, "on the average in Norfolk quite 10 per cent. of the land is occupied by hedges and hedgerow timber. There is a vast length and breadth of land occupied and overshadowed which ought to be producing a crop. If all unnecessary fences were cleared away and new and proper ones substituted for the remainder an accession of grain-bearing land would be available equal in extent to one of our large counties. By reconstructing the fences alone throughout England there would be gained 1,280,000 acres of land. . . . No fence should exceed 3 ft. in width."

Cambridge|| 1845, makes the suggestion that ditches by the side of fences are not required if the land is properly tile-drained at some little distance away from the line of the fence.

In Devon there is a shallow ditch or gutter on each side of the fence, where the land is flat and drainage water requires carrying off, which of course adds still further to the loss of land.

* See footnote p. 1409.

† See footnote p. 1409.

‡ See footnote p. 1410.

§ See footnote p. 1410.

|| *Journal. R.A.S.E.*, 1845, "On the Advantages of Reducing the Size and Number of Hedges," p. 333, W. Cambridge.

Turner* says that thorn hedges should not be wider than 10 in. at the bottom, and 3 ft. 6 in. high. More than one arable field on the farm is not required if the land is fairly compact and not straggling—sheep may be folded where required. In small fields the growing crops on the outside acre will not yield half the average of the whole field.

Bravender, writing in 1850 on "Farming of Gloucestershire,"† says that the removal of unnecessary hedges and pollard trees would enable the farmer to bring into cultivation a considerable quantity of land that is almost waste land in its present state, and he shows what a large acreage could be added to the country by a systematic reduction in the area occupied by hedgerows.

Darby‡ refers to "These straggling fences occupying more than one-twentieth part of the entire space with briars and furze bushes and fern, nearly covering ground pretended to be in grass, the divisions of which neither deserve the names of enclosures nor fields, for they are neither."

Hall§ remarks:—"As to the waste of land by our big wandering hedges Prout calculated that by straightening up his Sawbridgeworth farm, he gained 16 acres in 450" (i.e., $3\frac{1}{2}$ per cent.). . . . "When the old landlords drained and marled to improve their estates it is a pity that they did not also re-map them."

The writer took 30 measurements of the width of hedgerows in adjacent fields in the parish of Shaldon; the widths varied from 8.5 to 15 ft. and actually averaged 11.76 ft. The hedges were on hilly ground, consequently there were no ditches required. Had the measurements been taken on fairly level ground where ditches on either side of the fence were necessary, it is easy to imagine how much greater than 11.76 ft. these widths would have been.

There is no doubt that a considerable accession of cultivable land could be secured by doing away with ditches altogether as water courses alongside hedgerows—except where such ditches carry away an appreciable flow of water—and replacing them by tile drains.

The drain should preferably be run several feet away from the hedgerow (and parallel to it), or the roots from the latter soon find their way into the tiles and choke them up. This, however, is not so likely to take place where the hedgerows are placed on high banks as in Devonshire, but even in this case, in the course of time, there is a danger of the drains becoming choked by root growth. It is recommended, therefore, that tile drains should be placed 9 ft. or more away from the hedge-

§ "A Pilgrimage of British Farming," A. D. Hall, 1914.

rows and from 2 ft. 6 in. to 3 ft. 6 in. deep, according to the nature of the soil and subsoil. The deeper they are placed, the less likelihood there is of their becoming choked. After the drain is complete the ditches alongside the hedgerows should be filled in.

The annual cost of cleaning out the ditches, and the paring of their banks, to say nothing of the fertilising matter lost in them where cattle and sheep are allowed to have access to them, would all be prevented were the ditches done away with. The motor tractor, too, could then travel nearer the field boundary without running the risk of sinking in owing to the ditch bank giving way, as has happened in more than one case during the past season, resulting in considerable loss of time and expense in extricating the tractor.

The actual extent of the loss from hedgerows is not nearly realised by farmers. On asking a farmer how wide he would estimate the fences to be on land in his occupation, he said 4 or 5 ft. When he saw them actually measured at 11 to 13 ft. he could scarcely believe his eyes.

In the light of the above information, it would appear that Grant's figure of 13·2 ft. as the width of land lost on account of fences in Devonshire does not overstate the case, and on this basis the loss according to the size of the fields may be computed.

If it were possible to divide land up by fences arranged in the form of perfect squares, it could be shown that the theoretical loss of land per 100 acres, where the fences are 13·2 ft. wide (the Devon basis) would be as below with fields of the sizes given :—

<i>Size of Field in Acres.</i>	<i>Acres Lost per Cent.</i>	<i>Size of Field in Acres.</i>	<i>Acres Lost per Cent.</i>
$\frac{1}{2}$	17·88	6	5·16
1	12·64	7	4·78
2	8·94	8	4·47
3	7·30	9	4·22
4	6·32	10	4·00
5	5·65		

Thus the loss in the case of a $4\frac{1}{2}$ -acre enclosure (the average of the Devon figures) would be approximately 6 per cent., or 6 acres lost in every 100 acres by the space occupied by the fences.

If the present fields were enlarged to 10 acres—a uniformly suitable size—by throwing down the redundant fences only, and leaving the remainder, the gain would be $6-4 = 2$ acres

in each 100, or on the 48,630 acres surveyed, a total of 973 acres. In actual practice, however, the gain would be considerably greater, because fields are not square and hedges are not straight. The more the length of the field exceeds its breadth the greater will be the ground lost, as the following table shows :—

<i>Fields of 10 acres each with the following approxi- mate dimensions in yards.</i>	<i>Description.</i>	<i>Acres Lost per Cent. where width of Fence is 13.2 ft.</i>
220 × 220	Perfect square ..	4.00
155 × 312	Twice as long as broad.	4.24
127 × 381	Three times as long as broad	4.61
110 × 440	Four times as long as broad	5.00

If fields of minimum size of 10 acres result in an extra loss of 1 per cent. when they are four times as long as broad as shown above, it is evident, when the size is as small as $4\frac{1}{2}$ acres or even less, that instead of a 6 per cent. loss due to hedgerows, it may, in actual practice, be easily as much as 7 or even 8 per cent.

Of 12 adjacent fields in the parish of Kingsteignton, the writer found the length in proportion to the breadth (reckoned as 1) to be, respectively, 2, 2, 3, $3\frac{1}{2}$, $3\frac{1}{2}$, 4, 4, 5, 5, 7, 8 and 10, or an average length to breadth of about $5\frac{1}{2}$ to 1.

Add to this the loss due to fences being curved and meandering, also that many fences form re-entrant angles probably owing to the earlier removal of sub-dividing fences. Add again also the large number of field corners which cannot be regarded other than as waste ground. Finally, there is a considerable waste of land not previously referred to, viz., that occupied by lanes and approaches to fields which is always greater with small fields, and which was very noticeable in the survey made by the writer.

Loss Due to the Surface Soil having been Removed to Form the Fence.—Grant thus refers to this point :—“For nearly a ridge on each side of the bank, the corn is not worth reaping . . . the soil on each side of the hedge is thinner because the bank has been made of material taken therefrom.”

While Grigor says :—“There is no doubt that the broad ridges of soil thus formed as banks whereon the plants are placed are made at the expense of surface soil on each side of the fence line, which consequently becomes impoverished and hungry.”

It is natural to assume that the hedge banks would be built up by turf or soil taken as near as possible to the proposed line of fence, and not from soil which had to be transported

some distance, but there is abundant proof in the extreme thinness of the surface soil near the hedgerows on fairly level ground that when the banks were made the materials for them were obtained from alongside. Many farmers, moreover, consider it wasteful to apply any manure alongside the hedgerows, thus further tending to increase the area of waste ground.

Loss Due to Shade.—Next to the acreage lost on account of the ground occupied by the actual hedge bank is that ground which is shaded by the coppice growth on the top of the banks and the timber trees which are allowed to mature, and which together seriously affect the growth of crops underneath their shade.

Grant says :—" For nearly a ridge wide on each side of the bank the corn is hardly worth reaping," and " they shade and injure at least half as much . . . they prevent the free circulation of air and prevent corn drying for harvesting."

Grigor :—" It is said the fences are necessary for shelter, but such shelter is highly injurious to the crops near, where free circulation of air is impeded, rust, mildew, and blight are prevalent . . . What happens towards the end of summer when heavy rains are experienced, there may probably be intervals with wind and sunshine sufficient to dry the crops if they were exposed on all sides, but being surrounded by fences remain damp for several days—a prey to mildew and sprouting grain. . . . The greatest injury is due to the timber trees contained in the hedges, on account of the fertilising material they absorb, and also because of the drip of their branches. A space of land equal to that shaded by a tree is as completely lost to the farmer as if it were actually occupied by a fence. Take away your trees and hedges and you gain every year a quantity of nutritious food equal to the annual increase of their substance. Trees in Norfolk occupy rather more ground than the hedgerows in which they grow. From measurements taken in Norfolk, therefore, it appears that on the average in every 100 acres of land in the county 10 acres are occupied with hedges and hedgerow timber. In spring and autumn, when the sun is away from the vertical, the shade produced is very injurious, especially for ripening and drying corn. . . . Many hedgerows produce great transpiration, the atmosphere is damp, hence blight, smut, rust and mildew are prevalent."

Turner* states that in large fields, the soil dries quicker for cultivation purposes than in small ones, where the land is imprisoned by high hedges, and that there would be few headlands in larger fields. In small fields the growing crops on the outside acre will not yield half the average of the whole field.

Acland :—" In many cases the hedgerows in Somerset are so close that the roots of the elm trees must meet underground. . . . Owing to the shelter and the humid conditions caused along the hedgebanks sheep suffer considerably more from fly attack. . . . Barley and turnip crops in a dry summer grow nothing within 20 yards of a hedge

* *Journal, R.A.S.E.*, 1845, "On the Necessity of Reducing the Size and Number of Hedges," p. 479, T. H. Turner.

if it contains a very considerable quantity of timber. Turnips are almost always invariably mildewed."

Punchard* states that the need of shelter is urged, though a greater proportion of fences is found in the sheltered valleys and on the best land

Hall :—" There must be an enormous waste from these banks : not only is the area they actually occupy considerable, but for many yards they exercise an evil influence upon the corn, rendering it weak and blighted during growth, and slow to dry during harvest. A big hedge to a small field is quite enough to cause the repeated loss of the rare opportunities of getting home a crop that do occur even during such a rainy time as the August of 1912, when only the farmers who seized upon bare possibilities of harvest saved their crops before the deluges that marked the latter part of the month."

The following statement by Marshall in 1796 is, in its essence, so similar to the above quotation from Hall, and almost to the letter describes the writer's own experience in Devon during the past harvest, that it is placed last as being quite up to date :—" The corn of narrow, close fields, and everywhere under high trees, is by the many heavy rains much lodged, and in some places grown through by weeds, while in large, open fields, and where the hedges are low, very little damage is done, but at present I feel this inconvenience still more sensibly. We carried the middle of H 1 (wheat) the day before yesterday (Aug. 25th) in good order, but about a load under a high hedge was still damp and was obliged to be left in the field yesterday. Some of the sheaves are opened to give them air, a heavy storm came on before they could be reset up, but they are now growing into mats as they lie on the ground; had it not been for the high hedge they would have all been up at the barn. The oats of A under a high, thick hedge are mere dung; under one which was cut down last year about 4 ft. high, they are little worse for the weather.

The Cost of Upkeep of the Fences is Considerable.—Grant :—" These fences are expensive to erect, and also to trim and keep in repair; the cost of keeping in order may be taken as equivalent to 5 per cent. of the rental (of the land they enclose). . . . A much larger number of gates are required with their upkeep and renewal."

Grigor :—" There must be an entrance to each field, and therefore, in most cases, a gate; these have to be repaired and replaced."

Punchard, on the Third Prize Farm at Staverton :—" There are 200 gates, and these with posts lock up considerable capital which could be used elsewhere."

The writer calculated in the Shaldon district of 355 fields embracing only 1,168 acres that, if the fields were increased to an average size of 10 acres, 118 gates and 336 posts could be dispensed with, and their cost of repair and renewal abolished.

The Waste of Labour Involved.—Grant :—" The labour of every operation of the farm is most materially increased."

Grigor :—" These fences are expensive in labour, frequent turnings are necessary by the ploughmen. The time expended in cultivating small fields is enormous."

* *Journal, R.A.S.E.*, 1890, "Farming in Devon and Cornwall," p. 531, F. Punchard.

Hall :—" Again the presence of small, irregularly-shaped fields forms one of the great obstacles to really economic farming in England. It is not merely that time is wasted over the constant turnings, but a man gets thereby into a retail way of looking at things, and puts out of his consideration all schemes for handling crops on a large scale with the help of machinery. In most parts of England, the necessary preliminary to any capitalist exploitation of the land, such as would be extremely profitable on the thousand- or two thousand-acre scale, would necessarily begin with a complete reconstruction of the existing divisions of the land."

It is obvious to anyone practically acquainted with the operations of ploughing, harrowing, rolling, drilling, hoeing, mowing by machinery, raking, etc., that the loss of time in turning the implements used in these processes where the fields are small far exceeds that which obtains in fields of larger size. Add to this the more frequent transportation of implements from one field to another, including the partial dissembling and re-assembling, as in the case of the self-binding harvester and the artificial manure distributor, to mention only two of the newer types of farm machinery, and the consequence is a considerable loss of time and much unremunerative labour, which necessarily increases the cost per acre of all the cultural operations, in small fields, to a figure much beyond that applicable to fields of larger size. When the latest aid to field cultivation—the motor-tractor—is included, with the necessity for the wider headlands involved, surely the small arable field is doomed.

Numerous Hedgerows Offer Asylum to Various Farm Pests.—

Grant :—" They harbour birds and vermin which injure the crop. . . . They form nurseries for weeds."

Grigor :—" They form nurseries for thistles, nettles, docks, dandelions and seeds ready to be distributed by every wind. . . . They harbour snails and slugs, also birds and their nests. . . . Sparrows and greenfinches damage early barley, wheat and peas . . . on small fences birds do not alight for long."

Darby :—" providing for snug nurseries for all manner of filth . . . infested with pests of every kind."

Hall :—" Hedges, again, are always harbours of weeds and of those growing plagues—rats and sparrows, and the only good that can be said of them is that they provide shelter for stock."

Besides the vermin mentioned in the above extracts, rabbits should be added. The banks surmounted by hedges form most admirable grounds for the burrowing and breeding of rabbits. Even on the stiffer soils the hedge banks are practically always dry, and it does not take long, if the rabbits are not regularly and efficiently checked, for these hedge banks to become veritable rabbit warrens. That this is no exaggeration, the

"bags" obtained during the winter months by ferreting and trapping abundantly testify. It does not seem to be so generally recognised, however, that the hundreds of rabbits thus accounted for, often on quite small farms, have been raised at the expense of crops grown on the farm, to say nothing of the damage done to countless numbers of young plants of corn, roots, clovers, etc., which, eaten off in the early stages of growth, account for a much greater loss of crop than when devoured at, or just before reaching, maturity.

Conclusions.—It may be assumed that the figures given by Grant, both for the width of the fences and for the average size of the fields, are fairly applicable to the whole of the enclosed land in the county of Devon, which, excluding water and mountain and heath land used for grazing, is given as 1,208,826 acres.* The loss at the low estimate of 2 per cent. would be 24,176 acres. If the redundant fences only, *i.e.*, those forming enclosures less than 10 acres, were thrown down, this 24,000 acres would at once be added to the cropping capacity of the county, and if it were possible to till it all with wheat, producing an average crop of 32 bush. per acre, the total increase of food thus supplied would be 768,000 bush., sufficient to provide 100,000 men with bread for a year.

Were a bold course adopted, and the remaining hedgerows replaced by neat fences, which need not occupy, at most, more than one-quarter of the present average width of 13.2 ft., *viz.*, 3.3 ft., there would be available for food production an extra 3 per cent., or a total of 5 per cent., or 60,000 acres, which, of course, would feed a proportionately larger number of men.

As already stated, the south west is distinctly a country of small fields. The fields are smaller and hedgerows wider, perhaps, than those in most counties of England and Wales. It would not be permissible, therefore, to apply the same average all over the country; although it has been shown that Gloucester, Somerset, and many of the Welsh counties contain fields of small size bounded by wide hedgerows. It is possible that, since the various accounts referred to were written, some of the hedgerows have been removed, but much has certainly not been done in this respect in the county of Devon. An estimate, however, based on a 2 per cent. increase, will by no means be too high a figure for the whole of the

* Board of Agriculture and Fisheries, Acreage and Live Stock Returns, 1917.

country, were redundant hedgerows removed. This would mean an accession of more than 500,000 acres for England and Wales, and supposing half this acreage could be sown with wheat, a yield of 8,000,000 bush. extra might safely be counted on, say sufficient to provide bread for over a million people for a whole year, to say nothing of the productive value of the remaining half, if in good grass.

It has been assumed that no arable fields should be less than 10 acres in area, except for very special purposes, and it may be stated that with a fence not exceeding 3 ft. in width (which is more than ample), the actual area covered by the fence per 100 acres, in the case of fields set out in squares, would be less than 1 per cent.; also that 4,400 linear yds. (or $2\frac{1}{2}$ miles) of fencing would be required to re-enclose each 100 acres properly and completely.

Whether arable fields should be so small as 10 acres each is doubtful in these days of mechanical cultivation. Many farms in the south-east of the country have the whole of the arable in one large field, and when green crops are grown these are folded off for consumption. If the fields were taken on a 20-acre basis the fencing required per 100 acres would only be a little over $1\frac{3}{4}$ miles.

An Example from Japan.—Between the years 1900 and 1914 Japan set about the redivision of lands admitting of cultivation,* with the object of "increasing the profits to be derived from the utilisation of cultivated land." Laws were passed which provided "for the exchange and redistribution of lots, for a change in the configuration of holdings, and for the transformation and construction of roads, adjacent zones of territory, canals, etc." Both the owners of the property and the occupiers possess the right of requesting redistribution.

The total area already dealt with is something over 1,000,000 acres, comprising some 7,000 lots of land, averaging 144 acres each. The result has been a gain of 13.75 per cent. in cultivated land, due to the transformation of non-irrigated fields into irrigated ones, and the conversion of forest, ponds, and uncultivated land into irrigated and non-irrigated fields, and also to the damming or draining of lakes and lagoons.

An important result of the work of redividing lands has been the transformation of paddy fields, yielding one crop of rice per annum, into those yielding two crops per annum, viz.:—rice followed by one of barley, wheat, rye or beetroot.

* *International Review of Agricultural Economics*, May, 1918, pp. 409 et seq.

In fact the area of land yielding two crops per annum has been increased by 39 per cent. The production of rice has increased by 17 per cent. as the result of the redivision.

Finally, the following advantages have been secured: increased means of communication, the convenience of using canals for transport, the economy of labour and the increase in the value of the land.

The results obtained in Japan would not, of course, be the same in detail in this country, but the principle of increasing the food-producing area in the two island countries should apply equally in both cases. If it has paid Japan, and there is no doubt of this, to carry out a comprehensive scheme of redivision, it will pay Great Britain likewise, and the work necessary for its accomplishment appears to be exactly of such a kind which a demobilised army, used to trench digging, could efficiently carry out during the interval of possible lack of employment which is likely to occur between the change from military to civilian occupation. What is needed is Government action in the matter, for if left to private initiative there is no reason to assume that the work will be carried out to a greater extent in the future than it has been in the past.

The Cost.—The cost in Japan, spread over the whole area, was about £8 per acre, but it is calculated that 80 per cent. of this expenditure was absorbed by works of construction, while the remaining 20 per cent. represents costs of management and other accessory expenses.

The cost of throwing down hedgebanks in Devon before the War was from 2s. 9d. to 3s. per rod (5½ yds.) by hand labour. This cost now would probably be more than doubled. At 6s. per rod, the cost per mile would be £90. One mile long by 13·2 ft. wide would be 1·6 acres, which at the above figures would be £60 per acre of land gained. On the former assumption of a gain of 2 acres per cent. by throwing down redundant hedgerows, there would be a total cost per 100 acres of holding of £120, or 24s. per acre.

It is quite feasible, however, considerably to reduce the cost by the aid of mechanical power, such as some form of steam navvy, trenching machine, or even by strong grappling irons attached to steel ropes wound round the drum of a steam or motor-traction set of tackle, by means of which many of the hedgebanks could be pulled over, and the material subsequently worked by power and levelled, on the American plan, by machinery.

Difficulties.—In a scheme of the type outlined above, there are, of course, numerous difficulties. One of the most formidable is that of mixed ownership, so prevalent in this part of the country.

The writer's attention has been recently drawn to the case of a local farmer, who rents altogether about 150 acres of land under six landlords. His holding, if it can be so termed, consists of 52 fields. Of the 27 fields belonging to landlord A, 15 lie in one block, 3 in another, 2 in another and 2 in another. The remaining 5 fields are each isolated and surrounded by land belonging to other owners.

Of the 10 fields belonging to landlord B, 3 are in one block, and the remaining 7 are each isolated and surrounded by land belonging to other owners.

Of the 7 fields belonging to landlord C, there are 2 in one block, 2 in another, and the remaining 3 are each isolated and surrounded by land belonging to other owners.

Of the land belonging to landlords D, E and F, there are 4, 3, and 1 fields owned by each, respectively, and each of these 8 fields is isolated and surrounded by land belonging to other owners.

When one considers that this farmer's land is in a very hilly district, the time and labour absolutely wasted in getting from one field to another can be more easily imagined than described. This, however, is by no means an isolated example, and when the various ownerships are indicated in different colours on the 6-in. Ordnance Survey Maps, a most surprisingly complex patchwork arrangement is revealed, which further emphasises the importance of making the increase of the size of fields and the redistribution of the land a matter of real national concern.

THE CULTIVATION OF BASKET WILLOWS.

A LARGE area of the low-lying land of the river valleys of this country is too wet in character to admit of being treated as tillage, or of being used as pasture except during the drier months of the year. This land could probably be more profitably devoted to willow cultivation than to the growing of any other crop.

Basket Willows will not thrive on land which is water-logged for long periods, but floods are beneficial provided an adequate drainage system exists for the rapid removal of excess water.

Soil.—From the large number of cultivated willows varieties may be selected which will thrive on any class of soil except peat. Rich, heavy loam soils with substrata of clay are most suitable, but lighter soils prove satisfactory when other fertility factors are present. If willows are grown on peat the quality of rods produced is too poor, and the life duration of the plants too short, to admit of profitable cultivation.

Preparation of the Land.—The objects to be attained are :—

1. The removal of weeds ;
2. Pulverisation and the loosening of the top 10 in. (at least) of soil, so that the cuttings may be inserted to a suitable depth.

In the past the usual method of preparing the soil was by means of the spade.

Double-spit digging, or trenching, whereby the underspit becomes the surface soil (the turf layer being buried, grass side downwards, beneath it), is the most effective method of treatment, because the soil is thus deeply worked and can be kept clear of weeds for the first two years at small cost and to the great advantage of the young plants. Single-spit digging, or bastard trenching, to a depth of 10 in., care being taken to invert the sod, has been found to be satisfactory.

In some cases land can only be prepared by means of the spade, and the only objections to this practice as a general method are the heavy expenses thus incurred, and, with the labour usually available, the slow rate at which the work is performed.

Land may be prepared by means of the plough. Four or six horses are sometimes needed to turn a furrow slice completely in one operation, but a more efficient method of using this power might be to adopt the method of double ploughing, whereby the turf turned by one plough becomes buried under the lower slice turned by the other.

It is probable that where the land is sufficiently firm, steam ploughs would do satisfactory work.

In places where rushes and other deeply-rooted perennial plants abound, the land would need to be fallowed during the summer preceding the planting season.

Drainage.—A ready outflow for surplus water should be secured by scouring the neighbouring permanent watercourses. From these, open drains should be cut across the land in such directions as to secure effectual drainage of the soil and the least interference with later cultivation operations. Pipe drains may often be advantageously laid, especially at outlets.

Choice of Varieties.—About forty varieties of Basket Willows are grown commercially in this country, and many of them might be advantageously discarded. Although wide differences exist the varieties may be readily grouped according to their appearance and economic value. Such grouping generally agrees with their botanical classification.

HARD RODS OR FINE TOPS (*Salix triandra*).—This type includes varieties possessing characters most desired by the makers of the best quality baskets, as well as varieties of little value. They find greatest use as one-year-old rods. The chief varieties are : Black Maul, Black German, French, Italians, Dutch, Stonerods, Whissenders, Long Bud, Newkind, Mother Spaniards, Champion and Glibskin.

SOFT RODS OR FULL-TOPS—**OSIERS PROPER** (*Salix viminalis*). Compared with the *triandra* varieties the rods are longer, thicker, less tough, less pliable, and of poorer working quality ; the yield is greater, but the value per equal weight is less. The rods are specially suitable as staking for the framework for heavy basketry, and for the making of various kinds of baskets where *triandra* rods would be less suitable and unnecessarily expensive. The chief varieties are : Longskin, Brown Merrins, and various " Osiers " frequently distinguished in name and character by the colour of the bark in winter.

BITTER WILLOWS (*Salix purpurea*).—The rods of this species differ from those of the preceding species in being bitter, tougher, more supple, more finely tapering, freer from side shoots, and, in the chief varieties, shorter. They are suitable for conversion into " White," and as " Buff " are pale in colour. The rods are unexcelled in the making of the fine quality of small basketry. The chief varieties cultivated are : Old Dicks or Red Buds ; Light Dicks, Dark Dicks, and Kecks.

BLACK TOPS (*Salix hippophæfolia*) is a variety of good quality suitable for cultivation on sewage farms, because its dense foliage checks the growth of weeds.

" **BELGIAN RED** " AND " **GOLDEN WILLOW** " (*Salix alba*) are widely grown and are used as " Green," by market gardeners and nurserymen for tying purposes.

A prospective grower, in selecting varieties for planting, should have in mind :—

1. The varieties best suited to his land ;
2. The local supply and the kind of rods locally required ;
3. Varieties of good quality which would command a wider market ; and
4. The condition (green, white, buff) in which he ultimately intends to market his crop.

Cuttings or Sets.—Cuttings or sets are obtained by cutting either one-year-old or two-year-old rods in lengths of from 12 to 16 in. The best cuttings are taken from young, healthy heads. All the plants in the same bed should be of the same variety, because difficulties arise when willows are mixed and the value of such crops is depreciated.

Distance Apart.—The distance apart at which planting is done depends upon :—

1. *Variety.*—Many varieties differ greatly in their yields and in the size of the crowns which they develop. Consequently the spacing should be in accordance with the amount of growth made.
2. *The Methods of Cultivation* to be employed during the lifetime of the crop. The rows should be sufficiently wide to allow a horse to walk without stepping on the heads when horse hoeing is intended, but closer planting is possible when the ground is to be worked by hand.

In general, from 18,000 to 30,000 cuttings are required to plant one statute acre. The following distances apart are given for guidance, and from these the exact number of cuttings needed can be calculated :—

For varieties of *S. viminalis*, 22-26 in. by 16-18 in.

„ *S. triandra*, 20-24 „ 12-16 „

„ *S. purpurea*, 20-24 „ 10-12 „

These areas for individual plants should be maintained as nearly as possible in cases where “ planting on the square ” is adopted, *i.e.*, where equal distances between adjacent rows and adjacent plants in the same row are maintained. This system enables hoeing to be performed in two directions, but can only be adopted advantageously in cases where the size and shape of the fields permit and open drains are not essential. It is better to err on the side of too close than too wide planting, because the yield is increased, the closer foliage acts as a greater check on the growth of weeds, and the rods are straighter at the butts.

Planting.—This operation may be carried out at any convenient time between the months of November and March. The land should be harrowed and the cuttings inserted so that not more than 2 in. remain above the ground after the soil has been firmly pressed round them. Protection for the hand is afforded by the use of a leather pad. In order to facilitate cleaning, tillage, etc., it is important that adjacent rows should be equidistant throughout their lengths. This may be achieved (a) by means of a planting chain or long line, (b) by means of markers attached to the framework of a horse-drawn wheeled implement. During the growing season the land should be kept clear of weeds, and the surface layer of soil retained in a pulverised condition by hoeing, both by hand and by horse hoe.

Cutting the Crop.—The crop may be cut after the first leaf-fall, and before the second season's growth commences, or may be deferred until after the second season's growth has been completed. Special knives are used for the purpose. These should be kept sharp, and the rods should be cut close to the stem in this and in all subsequent years. Thus, well-shaped heads are developed close to the surface of the ground, whereby cutting is facilitated, a sufficient distance between plants is maintained for cultivation operations, and the chances of the plant becoming a host for injurious insects and fungi are diminished. The cut rods are tied in bundles, and removed from the ground.

Later Treatment of the Growing Crop.—Willow holt should be kept clean and fully planted. If allowed to become infested with weeds, a reduction in yield and quality follows, the life of the holt is considerably shortened, and the expenses incurred in cutting and sorting are increased.

Weeds may be removed by shallow digging and by horse and hand hoeing. The most efficient method of dealing with weeds is that practised by the Mawdsley (Lancashire) willow growers. Before growth commences, a ridging plough fitted with a stout, broad share, working to a depth of 2 to 3 in., is drawn along the intervals between the rows. Weeds are thus cut and the upturned layer of soil placed alongside the heads of the plants. After completion of the operation the land resembles a ridged-up potato field. The soil becomes dried and tempered, and is easily drawn back to its original position by means of scufflers. Weeds growing in the rows are removed by hand hoeing.

Full-length rods (full sets) are inserted in the spaces where plants have failed to grow.

Preparation of the Rods for Sale.—Rods may be sold as "Green," "Brown," "Buff" or "White." The freshly-cut crop "GREEN" may be allowed partially to dry in stook in the field. The bundles are afterwards stacked in a well-roofed shed or in the open air. When drying is completed the rods are known as "BROWN." If rain-water gains entrance to stored rods it rapidly causes serious damage, so that stacks in the open should be well covered and thatched. In converting "Green" to matured "Brown" 50 per cent. loss in weight occurs.

"BUFF" rods are prepared by removing the bark from either "Green" or "Brown" rods after they have been boiled in water for from two to five hours. They are then dried and intensified in colour by exposing them to sunlight. A buffing plant consists of a tank of approximately the following dimensions: 9 ft. long., 2 ft. 9 in. wide, and 2 ft. 6 in. deep. Iron boilers set with bricks, with a furnace beneath and a flue communicating with a chimney, are in common use, but in some places the bottom plate only consists of iron. The sides and ends are constructed of wood $2\frac{1}{2}$ to 3 in. thick, and are bolted or bracketed to the plate. The joints are tongued and grooved, and the tank is made water-tight by means of red lead. A suitable boiler forcing steam through closed coiled pipes within the tank might work with greater efficiency. The boiling tank should be erected in a shed of suitable size, or a special room should be provided to give weather protection to the peelers.

The peeled rods are spread out in rows in a field, being supported in an inclined position by a series of lightly-constructed temporary fences and allowed to remain until dry and the desired intensity of colour has been reached. The partially-dried rods are placed under cover, graded according to length, and when thoroughly dry are tied in bundles and stored. The storage room should be weather-proof, dry, and well ventilated. Serious damage will occur, owing to the development of moulds, if buffed rods are stored closely when in a damp condition and when dry rods are stored in a damp place. About 75 per cent. loss in weight occurs in converting "Green" to "Buff."

"WHITE" rods are prepared by removing the bark from "Green" rods. This operation is carried out in spring directly after the flow of sap has released the bark throughout its length from the underlying wood. At this stage the rods are cut from the heads and at once peeled by means of a "break." The essential parts of a break are a pair of straight upright iron rods suitably mounted on a stand and working in contact along their

inner edges by means of springs. Sufficient pressure is exerted during the passage of a willow rod between the jaws to break the bark on opposite sides. The bark is then removed by hand. Breaks differ in design, but the working principle is the same in all.

The period during which any variety may be "peeled from the head" is about 10 days, but the peeling period can be extended until July by adopting the following methods:—(1) By growing several varieties which arrive at the proper peeling condition in succession; (2) by couching; (3) by pieing; (4) by pitting.

Couching.—Spring-cut rods, in the condition for being peeled, are tied in bundles, a layer of which is laid on the ground, the tops being directed the same way. A similar layer, reversed in direction, is placed above with the butts at about the centre of the length of the lower layer. This order of arrangement of layers is continued until the stack is about six courses high. By thus directing all the tops outwards the rods do not suffer damage by becoming overheated. Drying is prevented by the addition of a liberal quantity of water and by covering the stack lightly with old peelings.

Pieing.—The bundles are arranged one layer thick in a sloping position on the ground, the tops of one row well over lapping the butts of the row immediately in front. The pie is then loosely covered with old peelings and kept moist by being watered when required.

Pitting.—Rods cut in March or earlier are tied in bundles and rested on their butts in dykes or specially-constructed, rectangular, flat-bottomed ponds through which flows a slow and continuous stream of water 4 to 8 in. in depth. In spring roots are formed and growth commences. Under this treatment rods remain in a satisfactory condition for peeling until August. Rods are peeled for "White" in the following order:—(a) From the head; (b) from the couch; (c) from the pie; (d) from the pit.

The freshly-peeled rods are dried in the open as in buffing, graded according to length, tied in bundles, and finally stacked in dry quarters.

Cost of Growing and Returns Obtained.—The wide variations in the value of land as determined by such factors as position, condition previous to preparation, state of fertility, the amount of labour available for cultivation, and the present abnormally high value of willows, do not permit at the present time of a

comprehensive reliable statement being made to meet all cases. The following summaries taken from the Board's publication on the Cultivation of Osiers and Willows (1913)* will serve as a guide :—

		FIRST YEAR.			Receipts.		
<i>Expenditure.</i>		£	s.	d.	£ s. d.		
Preliminary expenses of	2	0	0			
ploughing	4	0	0			
Cuttings	15	0	0			
Planting	1	5	0	2 tons " Green "		
					at £4 2s. 6d.		
					8	5	0
Rent and rates	1	15	0			
Labour and other expenses	4	15	0			
Total		£26	15	0	£8 5 0 per acre.		
		SECOND YEAR.					
Total expenses	£7	5	0	1 tons " Green "		
					at £4 10s. .. £18 0 0 ..		
		THIRD YEAR.					
Total expenses	£7	5	0	6 tons " Green "		
					at £4 10s. .. £27 0 0 ..		
Total for the three years		£41	5	0	£53 5 0 ..		

The expenses and returns differ much according to circumstances, but willow growers regard the crop as satisfactory when the total expenditure for the first three years is covered by the receipts for the same period.

It is more profitable to the grower to dispose of his crop either as " White " or " Buff " rather than as " Green," as the following table shows.

<i>Green.</i>	<i>White.</i>	<i>Balance in favour.</i>
3 tons worth £15 ..	Converted to 1 ton worth £24.	£5
	at cost of £4 (= total of £19).	
<i>Green.</i>	<i>Buff.</i>	
3 tons worth £15 ..	Converted to 1 ton worth £23.	£3
	at cost of £5 (= total of £20).	

The duration of a willow bed depends upon the suitability of the land and on the amount of care bestowed upon the crop. Suitable land will continue to yield satisfactory crops for 25 years, and occasionally for a longer period.

During the life of the crop the annual returns vary greatly, owing to damage which may arise from frost, storms, ground game, insects and fungi, adverse growing seasons, and to economic factors, but for a series of years on such land as should be used for the purpose, few other cultivated crops yield more satisfactory profits to the grower.

* Now out of print.

There are prospects that willow growing will be profitable for many years to come, because :—

1. The supply of home-grown rods will continue to fail to satisfy basket makers' requirements owing to the permanently dilapidated condition into which established beds have fallen, both at home and on the Continent.
2. Little new ground has been planted since the outbreak of war.
3. Basket-making as a national industry may be expected to grow, since it affords suitable employment for many partially-disabled ex-service men.
4. An export trade in certain varieties can be developed.

Security of Tenure.—As a large amount of capital is sunk in establishing the crop, the tenant of a holding held on the usual yearly tenancy should not embark on the work except with the previous written consent of the landlord to the improvement which, under the Agricultural Holdings Act, 1908, is necessary to enable the tenant to claim compensation from the landlord on the determination of the tenancy.

(This Article is also issued as the re-written form of Leaflet No. 36.)

INTENSIVE CULTURE.

THE following is a resumé of a Paper read before the Agricultural Club by Mr. R. K. Robbins on 8th January, 1919 :—

DESCRIPTION OF INTENSIVE METHODS OF CULTIVATION.—Intensive methods of cultivation may, of course, be applied to any form of culture, whether it be farm, market-garden or nursery crops. To many the term intensive culture is a synonym for French gardening, which is, perhaps, the most intensive form of culture. Others might be inclined to identify the term with culture under glass, and a few might associate it with market-gardening on the old lines, *i.e.*, by spade cultivation ; while the 1,400,000 allotments provide one of the most striking and useful illustrations of intensive culture.

The definition I propose to adopt for the present purpose is the production of fruit, vegetables, flowers, plants, trees, shrubs and seeds on a large or small scale, under glass or in the open—a definition which is perhaps best summed up by the term "horticulture." The amount of labour required per

100 acres for any of the purposes mentioned, as compared with the amount required per 100 acres for a well-managed mixed farm, is sufficient justification for regarding them as forms of intensive culture.

LABOUR REQUIRED.—The following estimate of the number of men required per 100 acres on a well-managed holding, devoted to (a) mixed farming, (b) fruit and vegetables, (c) culture of fruit, vegetables, etc., under glass, may be of interest.

- (a) Mixed farming 3-5 men.
- (b) Fruit and vegetables 20-30 „
- (c) Glass 200-300 „

STATISTICS.—The absence of reliable statistics concerning horticulture has probably been a drawback in securing State support for the industry in the past, but now that the recently-formed Chamber of Horticulture has engaged the services of a whole-time official to deal with this matter, it is hoped that in the not very distant future, fuller statistical data will be available.

Although no reliable and complete statistics are available concerning the magnitude of the industry, data are available to give some idea of its importance.

“Market Gardens and Nursery Grounds” disappeared from the Schedule of the Board of Agriculture's Returns in 1897, owing to the fact that market-garden crops often form part of the recognised area of an ordinary agricultural holding, and it was often practically impossible to separate such areas from less highly-farmed surfaces under the same occupation.

Small fruit orchards, however, still continue to receive attention in the Board's Report, and under the heading “Green Crops” are included some market-garden crops which are

1887	12,478	10,669	277	1,532	10,946

produced on a fairly large scale. The foregoing summary from the Board's Returns of the total areas under market gardens and nursery grounds is of interest.

The nearest official attempt to gauge the quantity, value and yield per acre of some of the most important fruit and market-garden crops will be found in the Agricultural Output of Great Britain (Cd. 6277, 1912). The figures quoted are for the year 1908 and are evidence of the national importance of this branch of the industry.

Crops.	Quantity.		Value.		Yield per Acre.

Crops under glass (155 acres)	—	—	—	150,000	—
				£17,918,500	

It is stated that the fruit crop for the year under review was below the average, but it will be seen that the total estimated value of the above fruit and market-garden crops for 1908 was a figure approximating to £18,000,000.

Apart from Government documents, by far the most comprehensive and intelligent account of the movement under consideration comes from the pen of Mr. E. A. Pratt in a work entitled "The Transition in Agriculture" (published by John Murray, 1906). His chapters on the Fruit Industry, Flowers, Bulbs, Production under Glass, Market Gardening, Special Vegetable Crops, Evesham and its Story, make not only intensely interesting reading but supply evidence of the magnitude and importance of intensive culture. It is now 13 years since Mr. Pratt's book was issued from the Press, and I suggest that an enquiry by a number of investigators working under the combined supervision of the Board of Agriculture and the Chamber of Horticulture, and planned somewhat on the lines of the Board's recent inquiry as to wages and conditions of employment in agriculture, would amply justify the expense and labour involved. Nothing but a thoroughly organised and systematic inquiry could reveal the extent and importance of the contribution made to the food supply and to the health of the nation by intensive cultivation, especially during the past four years.

The history of food production under glass provides, perhaps, the most romantic story in the annals of horticulture.

Less than 50 years ago the largest existing greenhouse was 200 ft. long by 20 ft. wide. To-day the area under glass cannot be less than 2,000 acres. The capital expenditure on a pre-war basis for an acre of glass is approximately £2,000. Thus the capital invested in this branch of horticulture—having regard to the initial outlay involved, and the working capital required to run the business—would probably be not less than £4,500,000 on a pre-war basis.

INTENSIVE CULTIVATION OF SPECIFIC CROPS.

Tomatoes.—Less than half-a-century ago the tomato plant was grown only for decorative purposes in greenhouses, and the fruit was no more considered to be edible than is now the berry of the deadly nightshade. To-day there are probably upwards of 1,000 acres of glass devoted to tomato culture. An average crop under glass yields from 30–35 tons per acre, per annum. The annual output, therefore, would be from 30,000–35,000 tons.

Cucumbers.—Prior to the War, many miles run of greenhouses were used for cucumber growing, and the cucumbers were consumed not only in the British Isles, but were sent in large quantities to Holland, Denmark, Germany and other European countries.

An acre of glass devoted to cucumbers has been known to produce as much as 80 tons during the season. An average crop would probably be 60 to 70 tons.

Grapes.—Forty years ago grapes used to come to the market in punnets containing 2 to 3 lb. each.

Until thirty years ago, old grapes at and after Christmas time were unknown. They are now retained on the vines until the end of March and early April, when the new crop is about to commence. Considerable quantities of English grapes are shipped to the United States.

The approximate weight per annum of grapes grown under glass in England is 2,000–2,200 tons.

Equally interesting and striking figures could be given concerning the cultivation of flowers and plants under glass, but sufficient has been said, I think, to warrant the statement that the cultivation of crops under glass is an industry of national importance.

Some striking figures were given by Dr. Keeble at the inaugural meeting of the Chamber of Horticulture on 2nd December last. He said:—

"I would like to give you two sets of figures which show that horticulturists know how to effect land settlement. Ten years ago there was a mixed arable farm of 130 acres in one of the Midland counties of England, and at that time it employed 5 permanent men. That farm has now been converted, as regards 80 acres, into fruit and market gardens, and it now employs 20 permanent men and 150 fruit pickers during the season. A second example, which points the same moral, is from one of our best-known growers who was kind enough to give me his biography. In 1881, the farm to which he refers, 150 acres in extent, was mostly arable, and it was run by 3 men and a boy with extra labour at harvest. The wages were 15s. per week per man. It was converted into a market garden, partly flowers and partly fruit. In two years the number of employees rose from 3 men and a boy to from 20–25 men and 80–100 women, and the wages rose to a minimum of 20s. The holding at the present time has been increased to just about double, and that land—310 acres—now employs 90 men in the winter and 110 men in the spring and summer, 50 women in the winter and 200 women in the summer. The wages in 1913 were £7,891; the wages in 1918 were £10,600, that is, over £34 per acre."

I do not think that there is any need to regard these figures as very exceptional,

The average figure paid for labour on a holding devoted to fruit and vegetables would be from £15–£20 per acre. Where

the forcing of vegetables in winter is undertaken the employment provided is of a more regular character, and, generally speaking, the amount spent in wages per acre is higher.

Rhubarb.—The forcing of rhubarb is, without doubt, the most considerable instance of the particular form of culture to which I refer. It is a speciality of the Leeds district, yet it is not confined to that area. In the height of the season, *i.e.*, February–March, 30 tons per day are despatched to the London markets.

Asparagus, mushrooms and seakale are examples of other vegetables forced on a far larger scale than most people imagine.

Seed Production.—The seed-growing industry is another branch of horticulture, the magnitude of which is not generally appreciated, and its development during the past three or four decades affords, perhaps, the most striking proof of the development of intensive culture generally.

The official figures quoted concerning orchard and small fruits are sufficient indication, without further comment, of their growing importance. My survey of the situation has been anything but complete. No reference has been made to the hop-growing industry, and only casual mention has been made of the area under potatoes, while only a passing hint has been given as to the value of food produced by intensive methods on the 1,400,000 allotments and the holdings of less than an acre with which published statistics do not deal. And yet sufficient has been said, I hope, to convince you of the importance of this great industry and of the right it has earned to encouragement by the State. I believe that an official inquiry on the lines indicated early in this article would show that between 1,500,000 and 2,000,000 acres are devoted to the various branches of horticulture, and that the annual value of the produce could not be calculated at less than £40,000,000, on a pre-war basis.

SUGGESTIONS AS TO STATE ASSISTANCE.

The question arises as to whether it is desirable, from the point of view of national interest, for the State to foster and encourage this great industry, and if so, what are the obstacles standing in the way of further development, how may they be best overcome, and on what lines should development be encouraged, and exactly in what form should State assistance be given. Does the future of intensive culture lie with the big

concern, fully equipped with the most up-to-date plant and machinery, conducting its operations on a scale sufficiently large to ensure the cost of production and distribution being kept at the lowest figures consistent with efficiency—employing a relatively small but highly-paid staff, and generally run on modern business lines? Or is the desideratum to be aimed at the creation of a huge number of small holdings, run on co-operative lines by men who are either tenants of the State or occupying owners?

A glance at the subjoined figures giving the value (roughly 14½ millions sterling) of fruit and vegetables imported in 1913 (the last statistical pre-war year) from foreign countries and the Colonies, and a review of our experience during the past four years will be sufficient to make any thinking man hesitate before hazarding the view that the limit of useful intensive culture has been reached.

HINDRANCES TO DEVELOPMENT.

It is only fair to admit, however, that there are considerable obstacles in the way of further development. During the War agriculturists have, not only in this country, but in most countries, been trading on the reserves of fertility stored up in the soil in happier days, and, unless those reserves are made good, production will not increase but diminish. The situation with regard to fertilisers is undoubtedly serious. You cannot, in my judgment, have any large development of intensive culture on commercial lines without an abundant supply of organic fertilisers and stable manure.

For certain forms of intensive culture "seasonal labour" is indispensable, but the difficulty of obtaining this is likely to increase unless side by side with future development there is a revival of subsidiary village industries.

An increased area devoted to intensive culture would involve an increased liability to diseases, for many of which science has so far failed to discover any effective remedy.

The machinery for the distribution of perishable produce falls very far short of complete efficiency, and this fact also militates against any large increase in its production. The very heavy risks involved in any system of intensive cultivation, owing to the vagaries of our climate, which may result in a glut or a complete failure of crop, will continue to make many people hesitate before embarking on the enterprise.

Then, too, the fiscal policy of the Government, whatever it may prove to be, is bound to be a controlling factor in the development of culture on intensive lines. With the increasing cost of production, a reversion to pre-war sale prices would not only arrest development, but would probably result in a serious diminution in the practice of intensive culture. It is true that foreign supplies encourage the habit of eating fruit and vegetables all the year round, and we have the benefit of this as soon as our own supplies are ready. I am aware also that English retailers of fruits and vegetables depend very largely during certain months of the year upon foreign supplies for their livelihood, and that, if these were entirely cut off, within a very short time a large percentage of the distributing agencies upon which the English grower depends for the disposal of his produce would be closed down. But that does not alter the fact that the English grower will not be able to stand the risk of glut or crop failure and ever-increasing wages,

fertilisers and machinery bills, unless the general average of sale prices in the future is a good deal higher than that ruling in pre-war days.

The increasing tendency of landowners to refuse to let land for market-gardening purposes is of course a serious hindrance to development on intensive lines. Another hindrance is our present system of rating whereby a man's liability for rates is increased in proportion to the improvements he has effected on the land he cultivates.

No great development of intensive culture is possible until the problem of rural housing has been solved. Insecurity of tenure, inadequate compensation for continuous manuring and high cultivation and high railway rates, with unfair classification, are other deterrents to that full development of intensive culture which we would all wish to see. What can be done to assist development? I have no hesitation in saying that very much can be done—by the growers themselves, and also by the Government.

HOW GROWERS CAN HELP THEMSELVES.

A thorough organisation of the industry—on lines adopted by other great enterprises—is one of the most urgent needs of the moment. It can be effected only by the growers themselves.

The adoption of standard weights and packages, and standard methods of packing and grading, would be an immense boon to the trade generally and would increase very materially, I believe, the demand for home-grown produce.

Buying and marketing on co-operative lines would, in the case of all but the largest growers, effect a considerable reduction in the cost of production and an increase in the price realised for goods produced.

A more enlightened attitude on the part of growers generally towards those engaged in scientific research work is greatly to be desired. Without the whole-hearted co-operation of practical men, scientists are too heavily handicapped to be able to accomplish much really useful work, and as time goes on it will, I am convinced, become more and more evident that the practical man is also heavily handicapped without the assistance of the man of science.

There is room also for a vigorous propaganda in the public Press and elsewhere as to the dietetic value of fruit and

vegetables and as to the best methods of preparing them for the table. Few people, comparatively, realise fully the value of fruit and vegetables as a source of human food, and fewer still know how to cook them. The War has taught the public a good deal in this direction, but there is still room for improvement, and it is safe to say that, if the health-giving properties of these commodities were once generally appreciated, home growers would have all their work cut out to meet the demand for them.

If the difficulties confronting the industry are to be successfully met, growers will have to become less individualistic. They will have to develop a willingness to pool their knowledge and experience—we shall have to realise as perhaps few of us have realised before, that to assist a fellow grower to improve the quality of his produce, to pack and grade it better, and to distribute it in the quarters where it is most needed will, in the long run, be doing a good turn to the trade generally, for nothing so quickly affects the demand for home-grown produce as poor quality goods, or even good quality goods improperly packed and imperfectly graded.

Growers should endeavour to find out what crops their soil is best suited for, and to grow those crops only. The attempt to produce crops that the soil is not naturally adapted for results in loss to the individual grower and injury to the trade generally, and it is to everyone's interest to prevent it if possible. A fully-organised industry will be in a position to enable its members to steer clear of many mistakes which have been all too common in the past.

STATE GRANTS IN AID.

The State can in the first instance assist the further development of the industry by putting an end, as soon as may be, to the system of control whereby the grower bears unaided any losses he suffers, but is obliged to share with the public any profits which accrue.

Further, we want from the State something a little more invigorating than platonic sympathy. The September, 1918, issue of the *Journal of the Board of Agriculture* gives a statement as to Grants in Aid of Agricultural Research for the Financial Year ending 31st March, 1919.* The total amounts to the munificent sum of £20,450.

The business of scientific research and the control and eradication of pests and diseases need tackling in real earnest

* See page 715.

if the State really desires that English horticulture shall hold its own. The country should be divided into provinces consisting of groups of counties—each province should have its fully-equipped and staffed research station, and each county should have its demonstration station, and, further, representative growers in each county should be asked to carry out experiments at the cost of the State and under the supervision of those in charge of the provincial research station—such experiments to be open to the inspection of all the growers in the locality.

No time should be lost by the Government in fully exploring the possibilities of increasing production and checking disease by electrical discharges upon the soil and of cheapening many cultural operations by the provision of electric power at a reasonable price.

It should be the aim of the State to show how costs of production can be reduced though wages are more than doubled. The giving effect to many recommendations of the Agricultural Policy Sub-Committee of the Reconstruction Committee would be equally beneficial to horticulture as to agriculture, especially the recommendation of the adoption of the "Evesham Custom" with regard to holdings let for market-garden purposes. The adoption of this custom provides what I believe to be the only practical and equitable way out of a very real difficulty, and under it the interest of both landlord and tenant seem adequately safeguarded.

The establishment of State pulping stations and drying plants in suitable districts would be beneficial and ought not to involve any permanent charge upon the Exchequer.

The policy inaugurated by Lord Ernle of appointing committees consisting of men with practical knowledge to act in an advisory capacity to the Board's Horticultural Department should be continued—nothing but good can result from conferences between the powers that be and the men that know.

Improved transport is one of the few things definitely promised to us. Is it too much to hope that transport facilities will be both cheapened and increased?

The last Government aid which I will suggest is the re-modelling of the rating system on principles more consistent with commonsense and equity than those upon which the existing system is based.

COMPARISON OF LARGE AND SMALL HOLDINGS.

In conclusion, does the future lie with the large and well-equipped holding or with the small holdings run on co-operative lines? In the main I am inclined to think that it rests with the former. Small holders, even though working on co-operative lines, will find it increasingly difficult to compete with the produce of the large and well-equipped holding. Expenses, however much the co-operative spirit may develop, must be higher all round on the small holding. The output per acre is not necessarily greater on a small than on a large holding. Moreover, you cannot, with any prospect of success, force the creation of small holdings; where land and conditions are suitable small holdings will be established without adventitious aid—as is demonstrated in the Evesham district. I am a whole-hearted believer in allotments; the more the better for the food supplies of the country and for the health of those who cultivate them. I may be wrong in my view of the prospects of the horticultural small holder, and if the small holder can be induced to work on co-operative lines there is possibly a much greater future before him than I imagine. There are strong sentimental reasons in favour of small holdings, but I think most Englishmen need more material advantages to satisfy them for any length of time. I agree that every facility should be afforded to returning soldiers to settle on the land if they express a keen desire to do so, but I hope they will not be encouraged to invest their savings in small holdings until they have been afforded a real opportunity of finding out whether they really like the life, and of satisfying themselves that the prospects are really as good as represented.

SOME FURTHER INVESTIGATIONS ON THE FOOD OF WILD BIRDS.*

WALTER E. COLLINGE, D.Sc., F.L.S.,

University of St. Andrews.

I.—INTRODUCTION.

THE writer has now been able to complete the examination of the stomach, etc., contents of a further eight species of wild birds, estimating the food contents by the volumetric method.

Hitherto considerable controversy has taken place with reference to most of these species, and as a result of the investigation recently completed it is now possible definitely to state the percentages of the different kinds of food eaten by each species, so that the injuries and benefits can at once be seen and their relationship to agriculture and fruit growing appreciated.

The total number of adult specimens examined is 798, obtained, with one exception, during each month of the year, and 166 nestlings.

With reference to the 17 species described in this and a previous article (*) definite standards are now proposed respecting their food and feeding habits, and the result of any future investigations on these species, in so far as they differ from these standards, will at once serve to show any change that has taken place in such habits in the intervening period. It need scarcely be pointed out that it is of considerable importance at any future date to bear in mind the question of whether the particular species studied has increased or decreased in numbers. Such information is often difficult to obtain, but a fairly correct approximation can, with a little trouble, be arrived at. Moreover, it is incumbent upon an investigator to endeavour to interpret and explain all such results in order that his work may economically be of practical value.

If, as the result of a large increase in numbers, a bird becomes injurious, due to an insufficiency of its natural food, and a consequent change of its feeding habits, then temporary repressive measures are desirable, firstly, in order to protect the crops, etc., from destruction, and secondly, in order quickly to arrest the change in its feeding habits and thereby secure the full benefit it normally confers.

It must ever be borne in mind that any estimate of a bird's economic status cannot be regarded as a fixed decision. Such

* A previous article on this subject was published in this *Journal*, September, 1918, p. 668. See reference No. 4 of Bibliography on p. 1461.

an estimate may hold good in some cases for a considerable length of time, but in other cases changes in the number of individuals, or in the environmental conditions, either locally or generally, may quickly bring about changes in the feeding habits: hence the necessity for continued investigation, and the provision for revision, at stated periods, of any repressive or protective measures enacted by the Law.

II.—SPECIMENS EXAMINED.

I. JACKDAW (*Corvus monedula*, Linn.).

The Jackdaw undoubtedly has a bad name, and those interested in the preservation of game have not been slow to magnify its delinquencies. Still it will not do to consider the economic position of this bird from that standpoint; such an attitude would manifestly be unfair, and fatal to quite a large number of species. Judgment must be based upon the sum total of its activities.

Lord Lilford (6) has drawn attention to the damage done by this bird "to chickens, pheasants and partridges, also to green peas and other vegetables." He adds, "in several instances to our knowledge they took possession of the owls' nests, destroyed their eggs, and piled up their nests in the cavities."

A Warwickshire correspondent writes, "Though I have no such evidence myself as regards barn owls, I have a very clear case regarding pigeons. I had a dovecote, one of the old-fashioned ones on a pole. In it some 20 to 30 pigeons were nesting one spring some years ago. One day I found all the pigeons sitting disconsolately on the barn, and a pair of Jacks strutting about the dovecote, having driven all the pigeons off their nests, and undoubtedly eaten their eggs and young. I shot the Jacks and the pigeons at once went back, and recommenced their nesting operations."

These are undoubtedly serious charges, and very apt to prejudice views with reference to this bird, but it must be borne in mind that the majority of Jackdaws do not prey upon barn owls, pigeons, or game-birds. Are these not rather isolated and exceptional cases due to the presence of too many birds in a given area, and, in consequence, to a scarcity of food or to sheer depravity on the part of a few birds only? The writer does not for a moment wish to minimize these depredations, but as a long and keen observer of this bird, and a poultry keeper as well, he has never personally seen or known of such cases.

Post-mortem Records.—The stomach contents of 48 specimens have been examined. Of the total food consumed during the year, 71.5 per cent. is animal food and 28.5 per cent. vegetable food. Of the former 39.5 per cent. consists of injurious insects, 2.5 per cent. of beneficial insects, 8.5 per cent. of neutral insects, 4.5 per cent. of slugs and snails, 3.5 per cent. of earthworms, 2.0 per cent. remains of eggs, 2.0 per cent. remains of

FIG. 1.—Diagrammatic Representation of the Percentages of Food of the Jacklaw.

young birds, and 9.0 per cent. of miscellaneous animal matter (spiders, millipedes, ticks, woodlice, young frogs and mice).

Amongst the injurious insects the following were identified : Larvæ of the Cockchafer (*Melolontha vulgaris*, Fabr.), the May Bug (*Phyllopertha horticola*, Linn.), the June Bug (*Rhizotrogus solstitialis*, Linn.), the Black Vine Weevil (*Otiorhynchus sulcatus*, Fabr.), larvæ (wireworms) and beetles of *Agriotes lineatus*, Linn. and *Sitones* sp., larvæ of the Winter Moth (*Cheimatobia brumata*, Linn.), the Mottled Umber Moth (*Hybernina defoliaria*, Linn.), the Cabbage Moth (*Mamestra brassicae*, Linn.), and the Turnip Dart Moth (*Agrotis segetum*, Schiff.).

Of the vegetable food 8.5 per cent. consists of cereals, 2.5 per cent. of potatoes and roots, 2.5 per cent. of pheasant and fowl food, 3.0 per cent. of fruit, 5.5 per cent. of fruits and seeds of weeds, and 6.5 per cent. of miscellaneous vegetable matter (grass and leaves not identifiable (Fig. 1*).

A summary of these items shows that, of the total food consumed, 48.5 per cent. is beneficial*, 28.5 per cent. neutral, and 23.0 per cent. injurious. The miscellaneous animal matter has been regarded as half beneficial and half neutral.

Conclusion.—In spite of the bad name that has been given to the Jackdaw, the actual injuries occasioned by it are comparatively small, whilst nearly half of its food consists of injurious insects, etc. There may be cases where it is too plentiful or too numerous in a district, but frequently its destruction is quite unnecessary. On the whole the good it does far outweighs the harm, and to condemn it for its misdeeds, as many writers have done, and to lose sight of the benefits it confers, is a very short sighted and mistaken policy.

2. STARLING (*Sturnus vulgaris*, Linn.)

In considering the economic position of the Starling three facts must be borne in mind, viz., (i.) during the past 15 or 16 years this species has enormously increased throughout the whole of the country. It is unnecessary here to adduce the evidence in support of this statement, but it is ample and overwhelming; (ii.) we have equally satisfactory evidence to show that in other countries where this bird has become abnormally abundant, it has become injurious; (iii.) quite a number of careful and competent observers have contended that owing to this increase the Starling has changed its feeding habits.

Where a species of wild bird becomes unusually abundant the conditions (ii.) and (iii.) invariably follow and, therefore, at the present time the economic status of this bird deserves more than ordinary attention.

There are also two further points that must not be overlooked, viz., the gregarious nature of the Starling, and the charges that have been brought against it of destroying or usurping the nests of other birds. In the case of the Starling, which exhibits both grain-eating and fruit-eating propensities, the habit of collecting in enormous flocks is one that presents a great element of danger, for these large assemblies may in a remarkably short

* In all the figures the portions shaded by longitudinal lines represent food that it is beneficial the birds should eat; those stippled, food that it is injurious they should eat; and the blank portions food of a neutral nature.

space of time completely ruin a crop. On the other hand, it is only fair to point out that they prove of great benefit in the case of an attack of an injurious insect, such, for instance, as that in Bavaria in 1889-91 of the Spruce or Nun Moth, when flocks containing as many as 10,000 birds were seen feeding upon the larvæ and pupæ of this moth. With regard to the charges of occupying the nests of other birds, the evidence as yet is far from satisfactory: the writer has no personal knowledge of any such cases.

FIG. 2.—Diagrammatic Representation of the Percentages of Food of the Starling.

Since 1913 the whole of the records for this species have been most carefully considered and a further series of stomach contents examined. The results obtained from these appear to enable us more accurately to form an opinion in connection with a species that has, certainly of recent years, been most perplexing.

Post-mortem Records.—As a result of the examination of 368 adults it was found that of the total food consumed in a year 51 per cent. consists of animal food and 49 per cent. of vegetable food. Of the former 26.5 per cent. is composed of

injurious insects, 2.5 per cent. of beneficial insects, 3.5 per cent. of neutral insects, 8.5 per cent. of earthworms, 6.5 per cent. of slugs, 1.5 per cent. of millipedes, and 2.0 per cent. of miscellaneous animal matter. The consumption of animal food is largest in April, May and June, the percentages in these months being 56, 96, and 97 respectively. Of the vegetable content 20.5 per cent. consists of cereals, 2.5 per cent. of roots and leaves, 15.5 per cent. of cultivated fruits, 7.0 per cent. of wild fruits and seeds of weeds, and 3.5 per cent. of miscellaneous vegetable matter (grass, bread, rice, etc.) (Fig. 2.).

Summarising these figures it is shown that 36.5 per cent. of the food is beneficial, 22.5 per cent. of a neutral nature, and 41.0 per cent. injurious.

As the Starling has been stated to be more injurious than the Rook, it will be interesting to compare the percentages of the different food items of the two species.

Table showing Percentages of Various Foods eaten by the Rook and Starling.

	Rook.	Starling.
Cereals	35.1	20.5
Potatoes and roots	1.4	2.5
Cultivated fruits	—	15.5
Wild fruits and seeds of weeds	4.4	7.0
Miscellaneous vegetable matter	6.1	3.5
Injurious insects	23.0	26.5
Beneficial insects	3.5	2.5
Neutral insects	4.6	3.5
Earthworms	4.4	8.5
Slugs, snails, and millipedes	3.2	8.0
Miscellaneous animal matter	1.4	2.0
Total animal food	41.0	51.0
Total vegetable food	59.0	49.0
Benefits	28.5	36.5
Injuries	52.0	41.0
Neutral	19.5	22.5

A careful comparison and consideration of the above figures shows that while the Starling consumes a considerable percentage of cereals and cultivated fruits, it also eats more injurious insects and less beneficial ones than the Rook. It also takes a greater percentage of slugs and snails, and while its injuries at present far outweigh the benefits it confers, they are not so great as those of the Rook.

Food of Nestlings. — The food of 40 nestlings has been estimated by the volumetric method and the following results

obtained : 89.0 per cent. consists of injurious insects, 1.5 per cent. of neutral insects, 6.5 per cent. of earthworms and slugs, and 3.0 per cent. of vegetable matter. The contents of 94 stomachs of nestlings (?) have previously been set forth numerically.

Conclusion. — There can no longer be any doubt as to the economic position which this species occupies. It has increased to such an extent that it has been forced to change its feeding habits. Many years ago Aplin (?) pointed out that the enormous increase of the Starling had led to a change of feeding habits in the Rook ; much of the animal and vegetable food that the Rook formerly lived on was taken by the Starling. Even that supply would now seem to be insufficient, and so, like the Rook, the Starling has gradually been forced to supplement its diet by cereals and fruit. This is undoubtedly a case which calls for carefully considered repressive measures. Farmers and fruit-growers have long been alive to the serious nature of the depredations inflicted by this bird, and have repeatedly called for some action. If it were considerably reduced in numbers this species would economically prove a most useful and valuable bird, whereas at present it must be classed as an injurious one.

3. CHAFFINCH (*Fringilla cœlebs*, Linn.).

Opinion is very divided as to the economic position this species occupies. As Slater (?) has pointed out, " Its delinquencies are so open and apparent that they may outweigh in popular estimation the great good it does." The same writer also remarks that it probably bears blame for the damage done to sown seeds by the Greenfinch, with which statement the writer fully agrees.

In a recent investigation made by Theobald and McGowan (⁸), where the stomach contents were estimated by the numerical method, the authors state, " It is extremely difficult to form any judgment regarding the economic status of the Chaffinch, but from the food contents found the writers are inclined to look upon it as neutral."

An analysis of the stomach contents of 128 adults and 32 nestlings estimated by the volumetric method enables us to form a rather more definite judgment.

Post-mortem Records. — Of the total food consumed in the year 25 per cent. is animal food and 75 per cent. vegetable food. Of the former 16.5 per cent. consists of injurious insects, 1.5 per cent. of beneficial insects, 4.5 per cent. of neutral

insects, 1.0 per cent. of spiders, and 1.5 per cent. of earthworms. The bulk of the vegetable food, viz, 56 per cent., consists of weed seeds, 4.5 per cent. of blossom buds, 3.5 per cent. of fruit pulp, 8.5 per cent. of cereals, and 2.5 per cent. of miscellaneous vegetable matter (Fig. 3).

FIG. 3.—Diagrammatic Representation of the Percentages of Food of the Chaffinch.

A summary of these figures shows that 65.5 per cent. of the food is of a neutral nature, 18.0 per cent. beneficial, and 16.5 per cent. injurious.

Food of Nestlings. — The whole of the food content of the 32 nestlings was of an animal nature, 98 per cent. consisting of injurious insects (aphids, larvæ of the Winter Moth (*Cheimatobia brumata*, Linn.), small Geometrid larvæ, the Apple Blossom Weevil (*Anthonomus pomorum*, Linn.), and other coleopterous larvæ), 1.0 per cent. of beneficial insects, and 1.0 per cent. of neutral insects.

Conclusion. — This species is by no means so plentiful as it was five or six years ago and, whilst not advocating any special protection for it, the writer thinks that both the farmer and the fruit-grower would be the sufferers if it were destroyed in any

great numbers, for its activities as a destroyer of injurious insects must be of great value and fully, or more than compensate for, the injuries it inflicts; the bulk of its food, however, is of a neutral nature.

4. YELLOW BUNTING (*Emberiza citrinella*, Linn.).

An investigation of the feeding habits of this species made in 1909⁽³⁾ showed that, in districts where it was plentiful, a certain amount of damage was done to cereals, but apart from this it was regarded as a beneficial species. Since that date the Yellow Bunting has considerably increased, and the charges

FIG. 4.—Diagrammatic Representation of the Percentages of Food of the Yellow Bunting.

of damage to cereals have been repeated. It was, therefore, thought advisable to include it in the series of species investigated during 1918.

Post-mortem Records.—Fifty-eight adults and 17 nestlings have been examined. Of the total food consumed in the year 29 per cent. was animal food and 71 per cent. vegetable food. Of the former 19.5 per cent. consists of injurious insects, 1.5 per cent. of beneficial insects, 2.5 per cent. of neutral insects,

2.0 per cent. of slugs, 1.5 per cent. of earthworms, and 2.0 per cent. of miscellaneous animal matter (millipedes, etc.) The bulk of the vegetable food consists of wild fruits and the seeds of weeds, this item alone accounting for 57.5 per cent., 4.0 per cent. of miscellaneous vegetable matter (leaves and grass), and 9.5 per cent. of cereals (Fig. 4). Particular attention has been given to this last item and the percentages kept for each month of the year. These are shown below :—

Table showing the Percentage of Cereals eaten by the Yellow Bunting in each Month of the Year.

Month.					Cereals.
January	5.5 per cent.
February	5.5 "
March	5.5 "
April	3.0 "
May	3.0 "
June	1.0 "
July	1.0 "
August	26.5 "
September	36.0 "
October	22.0 "
November	3.0 "
December	2.0 "
Total average					9.5 per cent.

These figures are interesting, for, excluding the months of August, September and October, they show that the average amount of cereals eaten in the year is only 2.46 per cent., from which it may be concluded that the bulk of cereals eaten by this bird is obtained from the stubbles and the stackyard.

Thus summarised the record shows 23.5 per cent. of the food as being beneficial, 65.5 per cent. neutral, and 11.0 per cent. injurious.

Food of Nestlings.—The whole of the stomach contents consisted of animal food, of which 99.0 per cent. was injurious insects, and 1.0 per cent. neutral insects.

Conclusion.—There are undoubtedly districts where this bird from time to time becomes fairly numerous, and it then damages cereals to a slight extent, but generally speaking its activities are beneficial.

6. GREAT TIT (*Parus major*, Linn., sub-sp. *newtoni*, Praz.).

The misdeeds of both this species and the Blue Tit have been grossly exaggerated by fruit-growers, gardeners, and

others, whilst previous workers estimating its stomach contents by the numerical method have not helped to re-establish its reputation. If every species of wild bird that during a few months of the year takes a certain toll of cultivated fruit is going to be condemned by the fruit-grower and gardener as one that should be destroyed, without considering what ratio this amount of fruit bears to the rest of its food, then successful fruit cultivation in this country will soon be a thing of the past. Were it not for the Tits and similar birds,

FIG. 5.—Diagrammatic Representation of the Percentages of Food of the Great Tit.

the cultivation of fruit would long ago have proved unprofitable, owing to the innumerable insect pests that attack the majority of fruit trees, and reappear year by year, in spite of spraying and other artificial means of protection.

Post-mortem Records.—The stomach contents of 32 specimens have been examined. Of the total food consumed during the year 77 per cent. consists of animal food and 23 per cent. of vegetable food. Of the former 66.5 per cent. consists of injurious insects, 4.0 per cent. of beneficial insects, 5.5 per cent. of neutral insects, and 1.0 per cent. of spiders. Of the

injurious insects 16.5 per cent. consists of aphids and scale insects, 15.5 per cent. of beetles, 29.0 per cent. of lepidopterous larvæ, and 5.5 per cent. of dipterous larvæ. Clearly identifiable amongst these were the following insects: Apple Leaf Aphis (*Aphis fitchii*, Sanderson), Woolly Aphis (*Schizoneura lanigera*, Hausm.), Apple Sucker (*Psylla mali*, Förster), Mussel Scale (*Lepidosaphes ulmi*, Linn.), Brown Currant Scale (*Lecanium persicæ*, var. *coryli*, Linn.), Apple Blossom Weevil (*Anthonomus pomorum*, Linn.), numerous fragments of weevils and Scolytidæ; the larvæ of the Winter Moth (*Cheimatobia brumata*, Linn.), Mottled Umber Moth (*Hybernia defoliaria*, Linn.), Codling Moth (*Carpocapsa pomonella*, Linn.), various Tortrices and Noctuidæ, Crane Flies, and numerous dipterous larvæ.

More than half, viz. 12.5 per cent., of the 23 per cent. of vegetable food consists of the fruits and seeds of weeds, 3.0 per cent. of fruit pulp, 1.5 per cent. of blossom buds, 1.5 per cent. of wheat, and 4.5 per cent. of miscellaneous vegetable matter (Fig. 5).

A summary of the above figures shows that 66.5 per cent. of the total food consumed is beneficial, 23.5 per cent. neutral, and 10 per cent. injurious.

Conclusion. — As a destroyer of injurious insects this bird must be reckoned as one of the most valuable we have, for in the case of many purely insectivorous birds many of the species of insects eaten are of a neutral nature and a fair percentage beneficial ones; here, however, 66.5 per cent. is injurious, and only 4.0 per cent. beneficial, and 5.5 per cent. neutral. Even admitting that the Great Tit damages much fruit which it does not eat, one cannot ignore the fact that whilst a hundred Tits in an orchard may commit an appreciable amount of damage to the fruit, it is extremely doubtful if there would have been any fruit to damage had it not been for their good services earlier in the season.

6. BLUE TIT (*Parus cæruleus*, Linn., sub.-sp. *obscurus*, Praz.).

This active, inquisitive little bird has, like its relative the Great Tit, been much maligned by fruit-growers and others. Long ago Yarrell (?) pointed out, "They see it busily at work on a fruit-tree, bud after bud coming under its scrutiny, while the protective covering of each drops on the ground and shows the destruction done. Content with such imperfect evidence, they go their way vowing vengeance on the Bluecap, and when

they get the chance are mostly as good as their word. . . . Yet none can be more mistaken than these men."

Post-mortem Records.—The stomach contents of 50 adults and 39 nestlings have been examined. Of the total food consumed during the year, 79 per cent. is animal food and 21 per cent. vegetable food. Of the former 78.0 per cent. consists of injurious insects, viz. 4.0 per cent. of aphids, 8.5 per cent. of scale insects, 18.5 per cent. of beetles, 23.5 per cent. of lepidopterous larvæ, and 23.5 per cent. of dipterous and hymenop-

FIG. 6.—Diagrammatic Representation of the Percentages of Food of the Blue Tit.

terous flies and larvæ. The remaining 1.0 per cent. of animal food consists of spiders. Of the vegetable food 8.5 per cent. consists of wild fruit and seeds of weeds, 2.5 per cent. of grass and miscellaneous vegetable matter, 6.0 per cent. of fruit pulp, 2.0 per cent. of blossom buds, and 2.0 per cent. of wheat (Fig. 6).

Thus of the total food consumed in a year 78.0 per cent. is beneficial, 12.0 per cent. neutral, and 10.0 per cent. injurious.

Conclusion.—It is sincerely to be hoped that the volumetric analysis given above will lead fruit-growers and gardeners to

realise more clearly the position this bird occupies. The sum total of its activities is distinctly beneficial, and all who foster or aid in its destruction are doing a serious injury both to themselves and fruit-growers in general.

7. SONG THRUSH (*Turdus musicus*, Linn.)

Whilst the food-habits of this species are very similar to those of the Missel Thrush, its liking for fruit is by no means so pronounced.

Post-mortem Records.— The stomach contents of 84 adults and 38 nestlings have been examined. Of the total food con-

FIG. 7.—Diagrammatic Representation of the Percentages of Food of the Song Thrush.

summed during the year, animal food constitutes 57 per cent. and vegetable food 43 per cent. Of the former 32.0 per cent. consists of injurious insects, 2.0 per cent. of beneficial insects, and 1.5 per cent. of neutral insects. Of the injurious insects 24.5 per cent. were beetles and beetle larvæ, 4.0 per cent. of lepidopterous larvæ, 2.5 per cent. of leather-jackets, crane flies and eggs of crane flies, and 1.0 per cent. of miscellaneous insects. Earthworms constitute 15.0 per cent. of the diet,

the percentage reaching 22.5 in May and 19.0 in June; slugs and snails represent 5.0 per cent., and miscellaneous animal matter 1.5 per cent.

Of the 43 per cent. of vegetable matter, wild fruits and seeds were present to the extent of 26.5 per cent., and cultivated fruits 15.0 per cent., the remaining 1.5 per cent. being miscellaneous vegetable matter (grass, bread, etc.) (Fig. 7).

Summarising these figures it is found that 37.0 per cent. of the total food consumed during a whole year is beneficial, 46.0 per cent. neutral, and 17.0 per cent. injurious.

Food of Nestlings.—The food of the nestlings is almost wholly of a beneficial nature; 90.5 per cent. consists of injurious insects, 2.0 per cent. of beneficial insects, and 3.5 per cent. of neutral insects. Only 3.0 per cent. consists of earthworms and slugs, and 1.0 per cent. of vegetable matter. Amongst the animal food were large quantities of fragments of weevils, 38 lepidopterous larvæ, 4 larvæ of Noctuid moths, 5 wireworms, 9 dipterous larvæ, 4 spiders, and remains of earthworms and slugs.

Conclusion.—That the Song Thrush during a comparatively short period of the year does considerable damage to certain cultivated fruits there can be no denying, but the injuries it occasions are more than fully compensated for by the benefits it confers during the remainder of the year. Except in southern localities where, like the Missel Thrush, this species occasionally becomes too numerous, its food record is all in its favour, and fruit-growers generally will be well advised and acting in their own interests if they leave this bird alone.

8. FIELDFARE (*Turdus pilaris*, Linn.).

This handsome autumn visitor has from time to time been reported to the writer as damaging fruit, but no trace of such has ever been found amongst the stomach contents. Archibald (1) states that "In very hard weather it has been known to do some damage to turnips," but before convicting it on this score it is important to know that these were not roots fed to sheep.

Post-mortem Records.—Of 30 specimens examined between September and May, the total animal food formed 59 per cent. and the total vegetable food 41 per cent. The various items were as follows: 34.5 per cent. consisted of injurious insects, viz., 28.5 per cent. of beetles and beetle larvæ, 4.5 per cent. of dipterous larvæ, and 1.5 per cent. of lepidopterous larvæ; 2.0 per cent. of neutral insects, and 1.0 per cent. of beneficial

insects. Earthworms were present to the extent of 14.5 per cent., slugs to 4.5 per cent., and spiders, millipedes, woodlice, etc., 2.5 per cent. Of the vegetable food 36.0 per cent. consists of wild fruits and weed seeds, 2.0 per cent. of grass, and 3.0 per cent. of miscellaneous vegetable matter not identifiable (Fig. 8).

Of the food consumed by this species during its residence in this country, therefore, 41.5 per cent. is beneficial, 57.5 per cent. neutral, and only 1.0 per cent. injurious.

FIG. 8.—Diagrammatic Representation of the Percentages of Food of the Fieldfare.

Conclusion. — So far as its present record is concerned, this is a most valuable bird to the farmer, and certainly merits every protection during its stay in this country.

GENERAL CONCLUSION AND SUMMARY.

The contention that birds as a class are beneficial is well illustrated by summarising the food percentages of the 16 species which have been treated of in this and a former paper (*). The House Sparrow is omitted, as only two records

have been obtained of the percentages of food. This list includes a typical series of our commoner wild birds, and shows that the benefits they confer are more than twice as great as the injuries they inflict.

Table showing (1) Beneficial, (2) Injurious, and (3) Neutral Food Eaten by each Species.

Species.					Benefits.	Injuries.	Neutral.
1.	Jackdaw	48.5	23.0	28.5
2.	Rook	28.5	52.0	19.5
3.	Starling	36.5	41.0	22.5
4.	Chaffinch	18.0	16.5	65.5
5.	Yellow Bunting	23.5	11.0	65.5
6.	Skylark	36.5	13.0	50.5
7.	Great Tit	66.5	10.0	23.5
8.	Blue Tit	78.0	10.0	12.0
9.	Mistle Thrush	35.5	21.0	43.5
10.	Song Thrush	37.0	17.0	46.0
11.	Fieldfare	41.5	1.0	57.5
12.	Green Woodpecker	100.0	—	—
13.	Sparrow Hawk	45.0	47.0	8.0
14.	Kestrel	89.5	6.0	4.5
15.	Lapwing	70.0	—	30.0
16.	Wood Pigeon	1.5	62.0	36.5
Averages					47.3	20.6	32.1

These figures may be visually illustrated by a diagram (Fig. 9).

Summary.—After examining the stomach contents of 798 adults and 166 nestlings, embracing eight species of wild birds, the opinion has been formed that :—

1. The Jackdaw, Yellow Bunting, Great Tit, Blue Tit Song Thrush and Fieldfare are distinctly beneficial.
2. The Great Tit, Blue Tit and Fieldfare are beneficial to such an extent that their protection is advisable.
3. In spite of the injuries it commits, it would be unwise to recommend any repressive measures for the Chaffinch.
4. The Starling has been allowed unduly to increase. At the present time it is far too numerous, and the injuries it commits are far greater than the benefits it confers. Temporary repressive measures would, no doubt, help to restore a more normal population of this bird, with considerable benefit to both the farmer and the fruit-grower.

IMPORTS, EXPORTS, AND SUPPLIES OF AGRICULTURAL PRODUCE OF THE UNITED KINGDOM DURING THE WAR.

WITH SPECIAL REFERENCE TO IMPORTS.

It is now possible, from the "Trade" Returns for the year 1918 recently published by the Board of Trade and from statistics prepared by the Board of Agriculture and Fisheries, to examine the effect the War has had on the prices and supplies of agricultural produce in the United Kingdom, and also, more particularly, to make comparisons between the two years 1917 and 1918.

The total value of the principal articles of agricultural produce imported into the United Kingdom during the last five years is as follows:—

1918	425,060,000
1917	357,181,000
1916	305,493,000
1915	276,648,000
1914	211,591,000

These figures represent the value (cost, insurance and freight) as declared to the Customs officers at the port of arrival, of the grain and flour, meat and animals for food, butter, cheese, eggs, condensed milk, fruit and vegetables, hops, lard and margarine, which may be grouped together as agricultural

products in the sense that they compete more or less directly with the products of the farmers of the United Kingdom.

In spite of the increase in *value* of 19·0 per cent. over the figure for 1917, and 100·9 per cent. over that for 1914, the *quantities* imported showed in the case of every article enumerated above, a decrease as compared with 1914, and a decrease in every article except one (*viz.*, condensed milk) as compared with 1917. In some cases, as will be seen from a study of the several tables of imports which are given later on in this article, the decrease in the quantities imported has been considerable. Thus, when the comparative values of the different commodities *per unit* are taken, the rise in price per cent. becomes much higher, and illustrates very forcibly the penalty this country has had to pay for its large dependence on the foreign market for its food supplies. It is noteworthy that in practically every instance the cost of the imported article has increased more than that produced in this country. The gradual rise which has taken place in the prices of imported agricultural produce during the years of war is shown in the following table :—

Average declared Value of Agricultural Produce Imported.

Description.	1918.	1917.	1916.	1915.	1914.	Percentage of Increase since 1914.
	£ s. d.	£ s. d.	£ s. d.	£ s. d.	£ s. d.	
Beef, fresh and refrigerated .. cwt.	4 14 8	3 18 5	3 5 4	3 0 1	2 3 1	120
Mutton	4 8 11	4 1 0	3 14 3	2 18 11	2 3 11	102
Pork	6 17 8	4 16 10	3 19 8	2 19 1	2 14 10	151
Bacon	8 12 7	6 6 1	4 12 6	3 18 0	3 11 6	141
Hams	8 7 7	6 4 9	4 8 0	3 11 4	3 13 0	130
Butter	12 10 6	10 9 2	8 14 4	7 0 3	6 0 7	108
Cheese	6 14 11	6 12 1	4 19 5	4 1 6	3 5 6	106
Eggs gt. hundred*	1 14 10	1 0 7	0 14 4	0 11 11	0 9 8	260
Wheat .. cwt.	0 18 4	0 18 6	0 14 5	0 12 11	0 8 7	114
„ flour ..	1 6 11	1 5 9	0 17 2	0 15 10	0 11 0	145
Barley	1 1 7	0 19 8	0 13 2	0 9 10	0 7 1	205
Oats	1 1 0	0 18 4	0 10 6	0 10 10	0 6 7	219
Maize	0 18 11	0 16 4	0 11 8	0 7 9	0 6 0	215

* A great hundred of eggs is 120.

It should, of course, be borne in mind that the qualities of the different articles imported may have altered through a variety of circumstances brought about by the War. Some countries (*e.g.*, Russia) have dropped out of the trade, while

the imports from other countries (*e.g.*, United States) have largely increased.

Meat.—No live cattle, sheep, or pigs for food have been *imported* since 1915. The following are the figures of *home live stock* for the last four years, taken from the Board of Agriculture's returns :—

—	1918.	1917.	1916.	1915.
Cows and heifers in milk or in calf	4,087,762	4,014,132	4,034,382	4,068,957
Heifers in calf	516,079	500,671	464,939	425,793
Other cattle :—				
Two years and above ..	2,289,684	2,338,407	2,344,667	2,221,218
One year and under two	2,747,295	2,757,222	2,801,698	2,665,551

Total	25,349,367	19,573,532	23,587,820	173,795,739	101,617,443	62,222,035
Foultry :—	Number.	Number.	Number.			
Alive	101	56	541,161	96	78	23,698
Dead	34,814	128,287	223,599	287,065	768,099	775,265
Game :—						
Alive	—	—	—	—	700	23,809
Dead	—	—	—	5,392	11,761	180,956

Total Imports of Meat.—The quantities and values of dead meat (excluding poultry and game) imported into this country during the last five years were as follows :—

				Quantity.		Value.
				Cwt.		£
1918	25,349,367	173,795,739
1917	19,573,552	101,617,443
1916	23,347,847	93,382,476
1915	25,276,030	86,151,234
1914	23,587,820	62,222,035

Beef.—No *fresh* beef was imported in 1918. *Chilled* beef was imported to the quantity of 164,819 cwt., as against 1,495,075 cwt. in the previous year, showing a heavy decrease. In regard to value, the figures decreased from £7,226,700 in 1917 to £775,140 in 1918. Argentine (124,538 cwt.) and Uruguay (23,721 cwt.) were the principal countries of import, but in each case the quantities showed a marked decline, the respective figures for 1917 being 1,073,102 cwt. and 58,891 cwt. It is noticeable that the imports from the United States decreased from 335,803 cwt. to 33 cwt., and from £1,678,365 to £188 in value, while, as in the two previous years, the imports from Australia and New Zealand were nil.

In regard to imports of *frozen* beef, imports rose from 4,626,645 cwt. in 1917 to 7,532,367 cwt. in 1918 in quantity, and £16,791,758 to £35,647,800 in value. The countries whence the beef was consigned were as follows :—

				1918.		1917.	
				Cwt.	£	Cwt.	£
United States	3,583,549	18,213,746	602,323	2,562,338
Argentine	1,879,167	8,646,962	1,598,030	5,336,463
Australia	551,609	1,976,733	1,107,704	3,784,994
New Zealand	460,289	1,635,046	760,094	2,709,385
Uruguay	186,411	847,892	171,912	726,602
Other countries	871,342	4,327,421	386,582	1,671,976

The most interesting features from the above table are the large decrease in the exports from Australia and New Zealand, the sudden rise of no less than 495 per cent. in the exports from the United States, and the almost stationary trade with Argentine.

As regards prices, the following figures per cwt. are given for the purpose of comparison :—

Imported Beef (declared Values at the Port of Arrival.)

				1918.	1917.	1914.	Increase Per Cent. since 1914.
				s. d.	s. d.	s. d.	
Chilled	94 1	96 8	42 10	120
Frozen	94 8	72 7	43 5	118

*Home-Killed Beef (Market Prices).**

—	1918.	1917.	1916.	1915.	1914.	Increase per Cent. since 1914.
English :—	<i>s. d.</i>	<i>s. d.</i>	<i>s. d.</i>	<i>s. d.</i>	<i>s. d.</i>	
1st quality ..	119 6	121 0	92 0	78 6	61 6	94
2nd quality ..	119 6	115 6	87 6	74 6	58 0	106
Cow and bull :—						
1st quality ..	119 6	109 6	82 0	70 0	53 0	125
2nd quality ..	112 6	99 6	75 0	64 6	47 6	137
Irish, Port Killed :—						
1st quality ..	119 6	118 6	89 0	76 0	58 6	104
2nd quality ..	117 6	112 0	84 6	72 0	55 0	114

* These prices are the average wholesale prices of five big markets in England.

Mutton.—The following are the figures of *frozen* mutton imported from the different countries for 1918 and 1917 :—

—	1918.		1917.	
	Cwt.	£	Cwt.	£
New Zealand	1,234,005	5,041,073	1,235,275	4,793,705
Argentina	710,630	3,605,600	470,836	2,166,854
Uruguay	57,356	298,235	29,473	131,401
Australia	26,168	85,774	496,114	1,821,520
Other countries	61,374	256,500	310,748	1,341,953

It will be seen that, while the imports from New Zealand remained almost stationary, a marked decrease is noticeable in the case of Australia, and a large increase in the case of South America.

Home-Killed Mutton (Market Prices).

—	1918.	1917.	1916.	1915.	1914.	Increase Per Cent. since 1914.

2nd quality ..	127 0	133 0	113 6	93 6	87 0	46

In regard to the price of imported mutton, the average price per cwt. for 1918 was 88s. 11d. The respective prices per cwt. for 1917 and 1914 were 81s. 0d. and 43s. 11d., but these prices include both fresh and frozen mutton.

The market prices per cwt. of *home-killed* mutton during the years 1914-18 are given in the table on the previous page.

Pork.—It will be noticed from the table on p. 1464 that the quantity of pork imported during 1918 has considerably decreased. The bulk of the supplies was received from America. The respective prices per cwt. for 1918 and 1917 were 137s. 8d. and 96s. 10d., as against 54s. 10d. in 1914, showing an increase since 1914 of 151 per cent. The market prices of *home-killed* pork during the years 1914-18 were as follows :—

—	1918.		1917.		1916.		1915.		1914.		Increase per Cent. since 1914.
	s.	d.	s.	d.	s.	d.	s.	d.	s.	d.

2nd quality ..	148	6	123	6	99	0	78	0	65	6	127

Bacon and Hams.—The main feature in regard to bacon and hams is the increased quantity imported. As in the case of pork, nearly all the supplies were received from the United States, the imports from that country in 1918 being—bacon 8,645,318 cwt.; hams 1,419,908 cwt. The declared average prices per cwt. during 1914-18 are given in the table on p. 1463.

—	1918.		1917.		1916.		1915.		1914.		Increase per Cent. since 1914.

The market prices per cwt. of Canadian and Irish bacon, and American and British hams during the years 1914-18, are given in the table on the previous page.

Rabbits.—Of the 522,542 cwt. of rabbits imported in 1918, 496,262 cwt. were received from Australia and 26,232 cwt. from New Zealand. The average prices for imported rabbits were :—1918, 46s. 7d. per cwt. ; 1917, 43s. 9d. per cwt.

Poultry and Game.—101 live poultry were imported in 1918 (value £96) as against 56 in 1917 (value £78). The quantities of dead poultry were :—1918, 34,814 cwt. ; 1917, 128,287 cwt. ; and the corresponding values £287,065 and £768,099. The values of game imported during 1918 and 1917 were £5,392 and £12,461 respectively.

Dairy Produce and Eggs.—

Imports of Dairy Produce, Margarine and Eggs.

Description.	Quantities.			Value.		
	1918.	1917.	1914.	1918.	1917.	1914.

	2,656,541	4,922,402	17,904,805	4,621,629	5,067,202	8,652,800

The average declared value per cwt. of dairy produce and eggs imported during the years 1914-18 and the increase per cent. since 1914 are given in the table on p. 1463.

Butter.—The figures given in the table above show a considerable falling off in the imports of butter into this country. Of the 1,614,625 cwt. imported, 372,572 cwt. came from New Zealand, 313,143 cwt.

—	1918.	1917.	1916.	1915.	1914.	Increase per Cent. since 1914.

* Average of Australian, New Zealand and Argentine:

from Argentina, and 217,284 cwt. from Victoria. Denmark, which in 1917 sent us 622,160 cwt., only exported 40,327 cwt. to the United Kingdom. It is very noticeable that the export of butter from the Continent decreased considerably in favour of countries in more distant parts of the world (Australia, New Zealand, Argentina and the United States).

The *market prices* of imported and British butter over the same period were as given in the second table on the previous page.

For the average *declared value* per cwt. of butter imported, see the table on p. 1463; the increase since 1914 was 108 per cent.

Margarine.—The figures relating to the importation of margarine given in the table above (p. 1468), are instructive as suggesting the considerable development of the margarine trade in this country.

Cheese.—The importation of cheese has not shown a great falling off. The Netherlands trade declined from 244,865 to 87,896 cwt., and Canada, whence we received one-half of our supplies, sent us 1,125,668 cwt. as against 1,757,949 cwt. in 1917. The *market prices* of Canadian and British cheese during 1914–1918 were as follows:—

—	1918.	1917.	1916.	1915.	1914.	Increase per Cent. since 1914.
Canadian (per cwt.) :—	s. d.	s. d.	s. d.	s. d.	s. d.	
1st quality ..	145 0	144 6	107 0	88 0	72 0	101
2nd quality ..	145 0	143 6	104 0	85 6	69 6	109
British Cheddar (per cwt.) :—						
1st quality ..	163 6	152 0	115 6	97 0	82 0	99
2nd quality ..	163 6	150 0	110 0	91 6	76 6	114
Cheshire (at London) (per cwt.) :—						
1st quality ..	174 6	161 6	126 0	100 0	83 0	109
2nd quality ..	174 6	160 0	119 0	93 6	78 0	124

For the average *declared value* per cwt. of cheese imported see the table on p. 1463; the increase since 1914 was 106 per cent.

Eggs.—A study of the figures relating to the importation of eggs shows that, in 1918, we only imported one-seventh of the pre-war

—	1918.	1917.	1916.	1915.	1914.	Increase per Cent. since 1914.
Danish	s. d.	s. d.	s. d.	s. d.	s. d.	
(per 120) :—

British (per 120):						
1st quality ..	43 3	26 6	20 2	16 2	13 6	220
2nd quality ..	41 2	24 3	18 4	14 11	12 4	234
Irish (per 120):						
1st quality ..	43 2	25 10	20 3	16 2	13 3	226
2nd quality ..	41 8	24 6	19 2	15 3	12 3	240

quantity, although the cost was over one-half that of 1914 (see table on p. 1468). The principal countries whence the eggs were consigned were Denmark (1,170,535 great hundreds) and Egypt (729,807 great hundreds). Russia, which in 1914 exported to the United Kingdom 6,870,827 great hundreds, sent us none at all in 1918. The second table on p. 1469 shows the market prices of Danish and British eggs during the years 1914-1918.

The increase in the average price per great hundred of the total quantity of eggs imported has risen 260 per cent. since 1914 (see table on p. 1463).

Grain and Meal.—

Imports of Grain, Pulse and Meals.

Description.	Quantities.			Value.		
	1918.	1917.	1914.	1918.	1917.	1914.
	Cwt.	Cwt.	Cwt.	£	£	£
Wheat ..	58,029,710	91,435,006	103,926,743	53,167,786	84,506,598	44,734,079
Wheat meal and flour ..	26,359,600	14,339,782	10,060,223	35,526,683	18,469,502	5,549,048
Barley ..	5,025,200	9,138,500	16,044,422	5,426,012	8,967,855	5,660,312
Oats ..	10,934,700	12,621,700	14,156,715	11,478,674	11,557,746	4,674,417
Peas ..	2,180,495	1,284,990	983,694	5,405,696	2,473,034	546,470
Beans (other than haricots) ..	438,511	905,087	1,441,559	641,802	883,513	502,928
Maize ..	14,751,177	25,008,918	39,040,747	13,930,365	20,385,915	11,760,912
Oatmeal ..	2,908,429	2,291,387	609,992	4,842,330	3,864,529	502,938
Maize meal ..	1,428,465	1,666,567	232,469	1,616,990	1,968,611	78,895
Other corn and meal ..	14,719,803	15,764,242	13,828,443	22,367,673	21,923,016	5,626,270
Total ..	136,776,090	174,456,179	200,325,007	154,404,011	175,000,319	79,636,269

As regards the quantity of wheat and barley imported the figures for 1918 show a considerable fall as compared with 1917. The importation of wheat meal and flour has almost doubled, while as regards other corn meal there has been a slight decline. Oats also show a drop.

Our supplies of wheat, barley and oats during 1917 and 1918 were received principally from the following countries:—

Wheat.

	1918.	1917.
	Cwt.	Cwt.
United States	24,757,610	54,208,300
Canada	15,968,700	18,408,300
Argentina	14,475,500	6,700,600

Barley.

	1918.	1917.
	Cwt.	Cwt.
United States	4,070,300	5,643,900
Canada	952,000	1,482,700

Oats.

	1918.	1917.
	Cwt.	Cwt.
United States	6,009,400	8,114,700
Canada	3,409,700	2,219,500
Argentina	1,479,500	924,600

Maize was chiefly imported during 1918 from the United States, 8,040,177 cwt. (10,670,300 cwt. in 1917); and Argentina, 3,584,000 (9,578,200 cwt. in 1917).

A point of interest is that Russia, which contributed not inconsiderably to our supply of cereals before the War, has dropped entirely out of the list.

The following are the returns, in quarters, of the cereal and pulse crops of the United Kingdom during the years 1914-17. It is not yet possible to give the figures for the United Kingdom for 1918, but a preliminary statement of those for England and Wales was published on p. 1028 of this *Journal* for November, 1918:—

	1917.	1916.	1915.	1914.
	qr.	qr.	qr.	qr.
Wheat	8,040,352	7,471,884	9,239,355	7,804,041
Barley	7,184,843	6,612,550	5,862,244	8,065,678
Oats	26,020,909	21,333,782	22,308,395	20,663,537
Beans	474,081	892,572	924,155	1,120,078
Peas	278,141	261,090	300,338	374,038

Prices of Cereals.—The prices per cwt. of cereals *imported*, and the rises in price per cent. since 1914, are shown in the table on p. 1463. The prices per quarter of *home-grown* cereals, and the corresponding percentage increases in price, are given in the following table:—

Crop.	Average Price per Quarter.					Percentage Increase since 1914.
	1918.	1917.	1916.	1915.	1914.	
	s. d.	s. d.	s. d.	s. d.	s. d.	
Wheat	72 10	75 9	58 5	52 10	34 11	109
Barley	59 0	64 9	53 6	37 4	27 2	117
Oats	49 4	49 10	33 5	30 2	20 11	136

Three points are of interest in connection with the prices of cereals: (1) the price per quarter of *home-grown* wheat, barley and oats was less in 1918 than in 1917; (2) the price per cwt. of *imported* wheat was less in 1918 than in 1917, but in the case of barley and oats a slight increase occurred; and (3) the *percentage increase* in the price of imported cereals is much higher than in the case of home-grown cereals. The tables show the ratios of imported to home-grown to be:—wheat, 114:107; barley, 205:117; oats, 219:136.

Fruit and Vegetables.—*Fruit* was imported to the value of £13,516,738 in 1918 as compared with £7,776,060 in 1917 and £11,118,051 in 1914. It is not possible to give the quantities which these values represent, but the following figures showing the decrease in the import trade of certain kinds of fruit which compete with the produce of British farmers are of interest:—

	1918.	1917.	1914.
	Cwt.	Cwt.	Cwt.
Apples	410,169	889,755	2,929,649
Pears	2,426	59,562	409,871
Plums	—	47,307	207,680
Strawberries	—	300	30,723

Vegetables.

Imports of Vegetables.

	1918.	1917.	1914.
	Cwt.	Cwt.	Cwt.
Potatoes	1,015,793	1,598,952	3,332,164
Onions	4,343,270	4,748,009	7,513,513
Tomatoes	516,412	519,101	1,576,617

The potatoes imported during 1918 were valued at £1,087,325; onions, £3,783,788; and tomatoes, £2,077,612.

It is worth noting that 99·5 per cent. of the potatoes imported during 1918 were received from the Channel Islands. France, which sent us one-third of our imports in 1914, has not sent us any during the last two years. The potato harvest in England and Wales in 1918 amounted to 4,209,000 tons, by far the largest ever raised, and 868,000 tons (more than 25 per cent.) above the previous year's record.

Hops were imported in 1918 to the extent of 52 cwt., as compared with 9,078 cwt. in 1917 and 97,306 cwt. in 1914, and the high figure of 200,337 cwt. in 1915.

Feeding Stuffs.—The shortage of feeding stuffs during the War is well borne out by the figures in the table hereunder. In spite of the large decrease in the quantity imported, the value of the imports has risen considerably.

Feeding Stuffs.

Description.	Quantity.			Value.		
	1918.	1917.	1914.	1918.	1917.	1914.
				£	£	£

ERADICATION OF WEEDS BY SPRAYS AND MANURES.

WINIFRED E. BRENCHELY, D.Sc.,

Rothamsted Experimental Station.

THE old established ways of weed destruction by appropriate methods of cultivation were sufficient and effective in the days when labour was plentiful and the land was less heavily cropped. Of late years, however, with the progress of intensive cultivation coupled with a constantly increasing shortage of labour, the problem has become critical, and many attempts have been made to supplement the mechanical means of eradication by

more rapid chemical methods. A considerable measure of success has attended the venture, though the natural conservatism of farmers has hitherto prevented a general adoption of the new methods. This may be owing partly to the failure of many people to realise that it is possible to destroy the weeds in this way without causing injury to the crop.

The chief reason that chemical weed killers can work successfully when applied to a growing crop lies in the fundamental difference in the habits of the majority of weeds and of such crops as cereals. The leaves of many weeds are broad and outstanding, and are often wrinkled, so that if moisture falls on them it is retained for a considerable time, often till it is dried up by evaporation. Cereals, on the contrary, have long, narrow, smooth leaves which grow upright and are often covered with a waxy coating or "bloom," so that the leaves do not remain wet for any length of time, as moisture cannot adhere to them. If, therefore, corrosive or poisonous substances are sprayed on to the plant, the cereals throw them off and are not injured, whereas the weeds retain them and suffer the full extent of the possible injury. This same characteristic, however, renders it impossible to treat with chemicals such broad-leaved crops as clover, trefoil, sainfoin, and serradella, as their leaves retain the injurious substance in the same way as weed leaves. With root crops, the constant cultivation that is carried on is usually sufficient to keep weeds in check, so that on arable land, as a rule, it is only cereals that are dealt with by chemical means, though copper sulphate has been used to eradicate charlock from mangolds without injury to the crop.*

These methods are not so useful on grass land, because, as the herbage consists of a mat of plants with a large total leaf surface, the chemicals are held up even by the grasses, and the amount of spray necessary to kill the weeds is sufficient to cause serious injury to the herbage itself, especially to such broad-leaved plants as clovers, which are a valuable constituent of the crop. In the majority of cases it is not possible to apply the spray in such a way that it reaches the weeds without affecting the rest of the herbage, and in consequence the method is of but limited use on grass land.

The success of the chemical eradication of weeds depends to some extent upon the weather. It is essential that the substance employed should remain upon the leaves long enough

* Holmes Chapel Coll. of Agric. (1903).

to come into action, and, therefore, if heavy rain falls immediately after an application of liquid spray, much of the benefit is lost. Consequently it is sometimes necessary to repeat the operation if the weather breaks too soon after a dressing of the destructive agent. Dry substances would easily be blown off from dry leaves, so when these are used it is usual to carry out the work when the leaves are wet with dew or rain, as then the stuff adheres firmly when the leaves dry.

The chemical substances used as weed killers may be divided into two groups :—

1. Chemicals that merely destroy the weeds and have no direct beneficial action upon the growth of the crops. These substances are usually applied in the liquid form as *sprays*.
2. Compounds that not only destroy the weeds but also exercise a manurial action, thus directly benefiting the crop at a later date. These substances are usually very finely ground *manures* and are applied as dry powders when the leaves are damp.

1. SPRAYS.—Most of these are corrosive in nature and destroy the delicate plant tissues, either killing the weeds outright or so crippling them that they cease to be active competitors of the crop. The chemicals are applied in solution, the strength varying according to circumstances. The most commonly used sprays are copper sulphate, iron sulphate, and sulphuric acid, but other substances are occasionally employed. A summary of many of the earlier spraying experiments was drawn up by H. C. Long in 1910,* and the results of these have largely been confirmed by those set forth in the present paper.

Copper Sulphate.—Copper sulphate in solution is the most familiar of the weed sprays used on a farm, and is generally associated with the destruction of charlock (*Brassica Sinapis*), though it is effective with other weeds. The rough crinkled leaf of charlock renders it very susceptible to injury and, given suitable weather, spraying nearly always makes a considerable reduction. The spray is best applied when the leaves have three or four well developed leaves, though later applications are often effective. The writer saw a farm at Gedling, Notts, in which charlock had been successfully sprayed when in full flower, but this delay is not to be recommended. Various

* Long, H. C., The Destruction of Weeds by Chemical Means, *Knowledge*, October and November, 1910.

experiments have shown that a 4 or 5 per cent. solution (4 or 5 lb. copper sulphate in 10 gal. of water) is the most effective strength, about 40 to 50 gal., containing 16 to 20 lb. copper sulphate per acre being required. In all cases the quantity of liquid should be sufficient to wet the weed thoroughly. In some cases a 3 per cent. solution is strong enough, but only under specially favourable conditions.*

Copper sulphate will eradicate spurrey if it be used strong enough. 50 gal. per acre of a 5 per cent. solution is effective, but a 3 per cent. solution only destroys about half the crop, allowing the other half to recover and ripen its seeds†. In the latter case the shoots at first become brown and shrivel at the tips, so that growth is checked for a time, but later on recovery sets in with many plants. Poppies are far more sensitive than spurrey as even a 2 per cent. solution injures them, and it has been suggested that two applications of a 3 per cent. solution with an interval of a few days might prove very effective in destroying them.

If a soluble manure is added to a corrosive spray the action of the latter is sometimes accentuated, as the manure stimulates the crop and enables it to forge ahead before any weeds have a chance of recovering from the action of the spray. Corn buttercup (*Ranunculus arvensis*) is very resistant to the action of copper sulphate, as a 4½ per cent. solution has but little effect on it. In one case, however, a clearance was effected by applying a 9.9 per cent. solution of copper sulphate, with the addition of 22 lb. sodium nitrate to each 10 gal. About 35-40 per cent. of the weeds were killed or badly injured, and before the rest could recover and make much growth the wheat had benefited by the nitrate and grown right away from the weeds‡. Such strong applications of copper sulphate, however, are not to be advised as a rule, as they need very careful handling to avoid doing damage to the crops.

Iron Sulphate.—To a great extent this can be used as a substitute for copper sulphate, but stronger solutions of the iron salt are necessary to obtain equal results. On the Continent iron sulphate is largely used for the destruction of charlock, 40 gal. per acre of 7 per cent. solution being most effective, especially among oat crops. In German experiments much heavier dressings have been used satisfactorily, and when

‡ Martin, J. B., C. R. de l'Academie d'Agriculture de France, II., 1916, pp. 420-424.

53 gal. per acre of a 22 per cent. solution were applied to infested oats not only was charlock destroyed, but the yield of oats from the treated plot was reported to be six times as heavy as that from a similar plot left untreated. In this case care was taken that the plants were quite dry before treatment, and the drastic effects on the charlock were visible within two days.* In this country the best results have been obtained with a 15 per cent. solution, that is to say, 60 lb. of iron sulphate dissolved in 40 gal. of water, per acre. The addition of molasses to the spray is sometimes recommended, as it causes the compound to adhere more firmly to the weeds.

Iron sulphate is better than copper sulphate for eradicating poppies and corn buttercup. A 15 per cent. solution destroys the weeds and does not injure the cereal crop; for corn buttercup spraying should be done in February, and for poppies as soon as the seedlings have developed three or four leaves.

Although this spray cannot be used on broad-leaved crops growing alone, it may be safely applied when leguminous crops are associated with cereals, as the latter are the taller and, together with the larger weeds, receive the bulk of the spray, thus protecting the lower growing broad-leaved plants to a great extent.

Sulphate of iron may also be applied dry as a fine powder at the rate of 3-4 cwt. per acre† and should be broadcasted or scattered by machine in the early morning while the leaves are still wet with dew.

Sulphuric Acid.—This is the most potent substance utilised for weed destruction, and owing to its corrosive nature needs very special precautions in handling. If properly dealt with, however, it proves effective in cases in which the more usual sprays are of little value. Sulphuric acid is one of the few sprays that has been found to clear grass land of bracken. A 5 per cent. solution causes the leaves to wilt within a few hours, and some days later the stems turn black and wither, because the acid is gradually conducted along the midrib and down the stalk, eventually reaching almost to the underground rhizomes.‡ A new growth springs up later, but a second spraying disposes of this for the year and also weakens the plant for the future. Where the growth of bracken is dense the canopy formed by the bracken leaves protects the underlying herbage

from the harmful effect of the acid, and as the following year the fern is later in appearing the grasses are able to get ahead earlier, resulting in an improved pasture.

On the Continent, sulphuric acid is considered a safe spray for cereals if used when the crop has only about five or six leaves. It is much used in parts of France (Lot-et-Garonne) for destroying wild radish among wheat, 90-100 gal. per acre of an 8 or 10 per cent. solution being employed. It is somewhat selective in its action, as certain weeds escape, especially wild oat (*Avena fatua*), medicks (*Medicago* sp.) and members of the lily family (as wild onion). It is, however, deadly to most annual and biennial weeds as poppies, charlock, corn buttercup, cornflower, wild carrot, radish, vetches and vetchlings, and it is said to be very effective in clearing these pests from badly infested fields.* For general use 60-70 gal. per acre of a 10 per cent. solution is sufficient for oats, rather less being used for barley.†

Various other Sprays.—In view of the difficulty in obtaining large quantities of copper sulphate at the present time, preliminary experiments have been made to ascertain whether *nickel sulphate* can be used as a substitute. At Rothamsted charlock plants were sprayed with 3 per cent. solutions of nickel and copper sulphate to contrast the effects. The nickel sulphate proved to be the slower in acting, but six days after spraying young plants were dead with both sprays, while with a 6 per cent. solution the action was rather more rapid. At a later date some very large plants just coming into flower were sprayed, but though both substances burned the leaves rather badly, neither killed the plants. Probably stronger solutions would have been necessary at this stage, but this initial test indicates that nickel sulphate may prove to be an effective substitute for copper sulphate.

Arsenite of soda, potassium chloride and sodium bisulphate have all been used as weed killers, but each has some special disadvantage which prevents it from coming into common use. *Arsenite of soda* is exceedingly poisonous to man and beast, and there is a great risk of poisoning when the crops are used, especially if it be applied to grass land which is either fed off or cut for hay. Besides this it is strongly held by the soil, being retained for an indefinite period in the top few inches. and if several successive applications are made, enough *arsenite of soda* may accumulate to hinder the germination and

† Jaguenaud, G., *Le Progres Agricole e Viticole*, 29, 1912, pp. 332-334.

growth of crops sown on arable land and to exercise a harmful action on the herbage of grass land.

Potassium chloride is ruled out at the present time on the score of expense, but when prices were moderate a 20–30 per cent. solution was occasionally used for destroying charlock, as the solution shrivelled the plants up completely. The potash salt has no bad effect on the cereals, but rather works beneficially by acting as a manure in addition to destroying the weeds.

Sodium bisulphate resembles sulphuric acid in its action, and is readily and cheaply obtained in places. In parts of France farmers can get truck loads from the powder works at the rate of 9½d. per 220 lb. free on rail.* Eighty gal. per acre of 45 per cent. solution are recommended for use, but the stuff is most unpleasant to handle, though it needs less precautions than sulphuric acid.

To sum up, therefore, copper sulphate and iron sulphate are effective and simple sprays whose value has been proved by years of constant usage. Nickel sulphate, though practically unknown in this respect, offers possibilities and might repay more extended trial. Under special circumstances, sulphuric acid has much to recommend it, but the majority of other sprays are of less general value, though several of them meet the case under particular local conditions.

2. MANURES.—The method of improving grass land by judicious artificial manuring has been gaining much ground of recent years. Incidentally this secures the reduction of the less useful plants or weeds, but this reduction is chiefly brought about by the increase in the competition of the more valuable grasses and not by a direct poisonous action on the weeds.

During the last few years, however, attempts have been made to destroy weeds on arable land by the application of finely ground manures, especially cyanamide and kainit, and on grass land by the use of lime, gaslime and salt, and a fair measure of success is considered to have rewarded the effort.

Calcium Cyanamide (Lime nitrogen).—Since this was introduced as a commercial manure it has been used a good deal in Germany as a means of destroying charlock and wild radish on arable land. It is claimed that dressings of 90–135 lb. per acre are quite effective for this purpose, provided that the cyanamide is applied when the plants are small and the leaves are damp†; thistles and poppies are injured as well as the

* Feuille d'information du Ministère d'Agriculture, XXIII., No. 8, 1918.

† *Deut. Landw. Presse*, 4th November, 1908; 21st January, 1914. *Mitt. der Deutsch. Landw. Gesell.*, 20th July, 1907.

charlock. In some cases the crops turn rather yellow for a few days after application, but they rapidly recover and make use of the extra nitrogen supplied, giving increased yields. When, however, these experiments were repeated in North Wales* failure resulted, as a dressing of 80 and 120 lb. per acre had no permanent effect either on the charlock or the crop, and all the weeds recovered from the temporary check they received.

Kainit.—Kainit, applied to arable land at the minimum rate of 10–11 cwt. per acre, is said to be effective in destroying charlock and many other weeds.† It needs to be very finely ground and should be dusted on the plants when they are wet with dew or rain, if possible on the morning of a fine day. For autumn-sown cereals February or March is the best time of application, for spring-sown corn the manure should be spread soon after the seeds have germinated and put out a few leaves. As kainit tends to consolidate the soil, a dressing of lime is advised on very heavy land to prevent this as far as possible.

Weeds vary in their response to kainit, as some are easily destroyed, whereas others are only slightly injured or escape damage. The chief weeds have been classified as follows:—

Weeds badly injured or destroyed by Kainit.—Charlock, wild radish, black bindweed, speedwell, chickweed, nettle, groundsel, cornflower, mayweed.

Weeds moderately injured.—*Persicaria*, spurrey.

Weeds only slightly injured.—Sowthistle, fumitory, poppy, spreading orache.

Salt.—Salt is occasionally useful in reducing weeds, especially on grass land. Five to six cwt. per acre applied in the spring at the time nettles are cut down will do much to prevent this weed from springing up again strongly. A similar dressing in early April will also reduce oxeye daisy.

Thistles, however, do not seem to respond to treatment, as the effect of judicious cutting is not intensified by the application of salt.‡

Lime.—This differs in its action from the foregoing, as instead of directly destroying the weeds it makes the soil less suitable for certain of the worst pests on sown land, as spurrey, sheep sorrel, corn marigold and annual knawel. Spurrey is

* Charlock Destruction, Univ. Coll. N. Wales, Bangor, Agric. Depart., Bull. I., 1909.

† *Landw. Jahrb.*, Bd. XLVI., 1914, pp. 627–657. (The destruction of weeds by kainit is at the moment of academic interest only, the cost of the substance being prohibitive.—*Ed.*)

‡ Destruction of Thistles. Field experiments at Harper Adams Agric. Coll. Report, 1908.

chiefly associated with light soils that are deficient in lime, and sheep sorrel, though it is found on both light and heavy soil, also indicates lime deficiency. Liming has been tried for the eradication of both these weeds, with indifferent success in the case of spurrey, with rather more success with sheep sorrel. When these weeds are abundant the shortage of lime is usually very marked, and an impossibly heavy dressing would be needed to alter the balance so as to make the soil really unsuitable for weeds. An ordinary dressing, such as 1 or 2 tons of lime per acre, has no effect on spurrey, though it brings about some improvement in the soil itself, and may thus tend to suppress the weed by encouraging the competition of other plants. This is particularly the case on grass land, on which sorrel (*Rumex Acetosa*) and sheep sorrel (*Rumex Acetosella*) are usually much reduced when liming is resorted to. It is usual to apply about 30 cwt. per acre to light land ranging up to 3 tons per acre on heavy, wet soils.

Gas lime, at the rate of 20 tons per acre, has proved effective in destroying false brome or tor-grass (*Brachypodium sylvaticum*) on Down pastures.* The gas lime was applied in autumn, and soon killed the tor-grass (and other grasses as well). The following spring the land was harrowed and worked up to a fine tilth preparatory to sowing a mixture of good grass seeds for the provision of a strong new turf. Such a method could only be applied when the area affected is small.

Taking all things into consideration, the use of finely ground manures as weed killers offers possibilities, but up to the present the results have been so uncertain and variable that it is not yet advisable to make definite recommendations for their use. Experimental work in this direction could easily be extended, as even though failure should attend the effort to destroy the weeds, the beneficial effect of the manure on the growth of the crop would offer considerable compensation.

FAGGOT DRAINING.—BUSH DRAINING.—WOOD DITCHING.

FAGGOT or bush drainage is an ancient practice, still in use in several localities, especially in the Eastern Counties of England. As the present shortage of drain pipes is likely to continue for some time it is felt that the practice might be extended, especially in connection with mole drainage on heavy clay soils. Faggot drains may be expected to last as long as the mole drains which they serve.

The purpose of this article is to explain briefly the methods usually employed in the making of faggot drains in connection with mole drainage, but the system outlined, with certain modifications, has been successfully adopted under other conditions; for instance, on boggy land or other soils where pipe drains might shift.

The object aimed at in the construction of a bush drain is to secure an underground passage for water. This object is gained by laying brushwood and other material in the bottom of a trench in such a way as to support the covering soil without either itself impeding the flow or allowing the soil to drop through and choke the drain. Later, when the brushwood rots the passage becomes clearer.

Care is necessary at each stage of the work.

Digging the Trench.—The trench should be dug with steeply sloping sides and narrowed to a width of not more than 3 in. at the bottom. Used as a feeder it should not be more than 27 in. in depth. A plough will save some depth in digging, but it is important that the trench should be cut narrow, the ditcher working from above, and not in the trench. Afterwards ordinary drainage tools are used; for taking out the lower spits a narrow spade about 12 in. long, $4\frac{1}{2}$ in. wide at the top, and 2 to $2\frac{1}{2}$ in. at the bottom is serviceable. The ditcher should be careful to keep his spade wet in order to get the sides of the trench cut clean. The lower spits, when taken out, must not be mixed with the upper soil. The bottom should be finished with a draining scoop or hoe in the same way as for drain pipes. It is most important that the bottom should be smooth and level. The trench must, of course, be dug from the outfall upwards.

Material for Filling.—The brush may consist of any wood, but whitethorn and blackthorn are the most favoured. Willow, alder, hazel, or dogwood, in fact anything that grows fairly straight, may be employed. The wood should be used green.

The brush should be cut about 2 in. diameter at the butt. If brush of this thickness is not to be had, and smaller is used, it should be more bunched together. It should be as nearly as possible of the same length and as long as it can be cut, remaining fairly straight; naturally, some woods cannot be cut as long as others. Projecting branches should be nicked with the bill, so as to be the more readily pressed into the narrow bottom of the trench, without pulling in the sides.

Laying the Brush in the Trench.—This operation requires care. The point to be remembered is that the bushy ends must always be kept on top, pointing away from the outfall. Consequently, the workman who lays in the brush must work in the direction from the head to the outfall. The butts must

Fig. A.—Right Method.

Fig. B.—Wrong Method.

(N.B.—The figures show a longitudinal section of the trench).

rest on the bottom of the drain and each fresh butt must be placed a little more towards the outfall than the last, so that the sticks overlay continuously. (*see figures.*) Two objects are thus secured: the butts, pointing downwards, will not stem the flow of water, while the bushy ends will overlie the butts, to act as a support to the covering soil.

The workman must not stand in the ditch while laying the brushwood.

The brush is pressed securely in place with a crotched stick like a clothes prop and then trodden firm, but great care must

be taken not to knock loose soil into the bottom of the trench. The brush, when pressed down, should have a depth of not more than 6 in. or 7 in.

Above the wood, straw (usually barley straw) is laid to a depth of 2 to 3 in. Some prefer to make the straw into a thick rope, using a straw winder, and to lay this rope, which can be made in lengths of 12 to 18 yards, in long coils over the brush.

The object of the brush is to support the straw; the object of the straw to support the covering soil. The amount of brush or straw used should be no more than sufficient for the purpose. A good deal will depend on the nature of the ground; tough clay will not require the same amount of support as less tenacious soil or soil in which there may be a little gravel. Something too will depend on the nature of the brushwood. But it is better to err on the side of too much than too little support.

In place of straw, rushes, grassy hedge brushings, sprays of pine or heather may be used. Sometimes heather is used alone, without any larger brush.

Filling in the Earth.—This also requires care. The workman should start from the outfall end and work towards the head. By so doing he will cause the fine twigs to overlap better and so to fulfil their purpose of supporting the roof.

The lower spits should be taken up with the hand, laid upon the straw and well trodden down. After this the plough and the shovel may be used. But if the tough lower spits are not first placed firmly in position, there is a danger lest the more friable surface soil should fall in and work its way into the drain, if not at once, at any rate after the straw and brush have decayed. If carefully laid, however, the lower spits tend to form a solid arch.*

If the drain is at all long, it is advisable to construct it in sections, finishing off a section each day completely. The connecting up of the brushwood at the ends of each section will require a little care, but should present no real difficulty.

The Outfall.—At the outfall, which should, of course, discharge down, not square across or up, the main drain, either some drain pipes should be placed or a square pipe about 4 ft. long, constructed of creosoted boards 1 in. thick, and 4 to 5 in. wide. Another plan is to allow some good stout butts to

* In cases where the drain is intended to drain the soil, rather than to take the water from tributary mole drains, less packing of the overlying soil will be required. A certain amount of the stiff lower soil should, however, be used to cover the brush. Where tiles are used brush may be packed on top of the tiles, thus securing a greater capacity for the drain.

project 6 to 12 in., but this should only be done when there is no danger of an obstruction being caused thereby in the open drain. Flat stones might also be employed.

In cases where, as often happens, the brush drain runs through a headland into the ditch, pipes should be laid in the section under the headland, otherwise the drain may be squeezed by pressure overhead.

In any case a grating must be provided or a few lengths of stout wire placed upright before the outlet or crossed X-wise through holes drilled in a drain-pipe, to prevent rats or rabbits finding their way into the drain. A certain amount of broken glass mixed with the soil at the outlet will prevent vermin burrowing.

Connecting up with Mole-drainage.—When brush drains are to be used as mains in connection with mole-drains, they are usually completed first, at least 6 in. deeper than the depth at which the mole is to be drawn. When the mole draining is being carried out, the mole is drawn across the main drain just above the brush. But if the main runs athwart the slope of the field, there is a danger of the water in the moles being carried across the main into the openings of the moles on the other side, with the result that the main does not do its fair work and the land lower down the slope may get waterlogged. In this case the moles are best put in first and the mains cut immediately afterwards. The mole openings on the lower side of the mains can then be plugged before the mains are filled in.

No. 62.)*

SMUT DISEASES OF BARLEY AND OF OATS.

W. B. MERCER, B.Sc., and S. P. MERCER, B.Sc.,

Armstrong College, Newcastle-on-Tyne.

A PAPER appeared in the issue of this *Journal* for October, 1916 (Vol. XXIII, No. 7) dealing with the Smut Diseases of Wheat, and the present article is intended as complementary thereto. It completes the tale of the "Smuts" as far as they

affect the cereals commonly grown for grain in this country ; and in order to facilitate reference, the series is concluded by a synoptic survey, in tabular form, of the diseases under consideration (including those previously dealt with as attacking wheat), their diagnostic symptoms and the methods of treatment applicable in each case.

SMUTS OF BARLEY. — Barley is subject to two kinds of smut, caused by two distinct species of fungus. The appearance of the two diseases is somewhat similar, but the life histories of fungi responsible are essentially different ; and whereas one disease is easily combated, the other is extremely difficult to deal with.

1. Loose Smut (*Ustilago nuda*, (Jens.) Kell. et Swing.).—An attacked plant is very similar in appearance to a wheat plant suffering from loose smut. When the crop shoots, diseased ears are seen to be almost wholly destroyed, the grains being replaced by a mass of black powder, which quickly blows away, leaving a bare stalk (Fig. 1, A, B). The black powder is made up of countless spores of the fungus. These spores are indistinguishable from the spores of the loose smut of wheat, and they germinate in a similar way (Fig. 1, C, D).

The life-history of the fungus is identical with that of *Ustilago Tritici* (except that the host plant is barley instead of wheat). The spores infect the young grain at the time of flowering, and produce within it a small amount of mycelium, or "spawn." The grain develops normally, however, despite the presence of the parasite. When such grain is sown the fungus develops with the young plant, and eventually destroys the ear. These facts, discovered by continental workers, have recently been verified by the writers, *e.g.*, in one of the experiments flowers of barley were artificially inoculated with spores of the disease by means of a small brush. The plants were marked and the grain therefrom collected when ripe. A few were examined microscopically, when hyphæ of the fungus could readily be detected both in the embryo and endosperm. The remaining grains were sown after "pickling" in formalin. Over 25 per cent. of the resulting plants were diseased.

On the other hand, all attempts to infect the young plant by means of spores sown with the seed have failed.

Though the disease is so similar to loose smut in wheat, it is impossible to infect wheat with spores from barley, or barley with spores from wheat.

Prevalence of the Disease.—In the north-east, this disease, though wide-spread, is not abundant. The majority of barley

fields have a few diseased ears, but the proportion is in most cases a very small one.*

Treatment.—Numerous investigators have devoted attention within the last few years to the knotty problem of a practical method for the control of loose smut. Many fungicides have been tried. The only one giving promise of success is hot water. Details of the hot-water treatment were given in the previous article in this *Journal*, on loose smut in wheat.

Briefly, the grain is placed in a sack or basket and allowed to stand for about four hours with occasional swaying to and fro in water, either cold or, preferably, lukewarm; it is then transferred for five minutes to water at about 120° F., and finally to a tank of hot water for ten minutes, the contents of the tank being kept as nearly as possible at a temperature of 124° F. by the addition of hot or cold water in small quantities as it becomes necessary. The water in the tank should be kept below 131° F. The grain is then spread out to dry.

Formerly, the same temperature was employed as for wheat (126°—129° F.), but two workers have lately shown, independently, that 124° F. is more satisfactory. Lakon has found barley treated with hot water to be slightly improved in germination, as shown in laboratory tests, but to be reduced in capacity for growth in the field. The latter fact agrees with the writers' observations, and with general experience. In view of this, and of the natural swelling of the soaked grain, in drilling barley so treated the normal seed rate per acre must be increased by one-fourth.

2. Covered Smut (*Ustilago Hordei*, (Pers.) Kell. et Swing.).—An attacked plant may be detected when first the crop "shoots" by the dark colour of its ear, but it becomes much more conspicuous towards harvest time. The ear is small, but is not as a rule noticeably distorted (Fig. 2. A). On examination, however, the grains are seen to be replaced by black masses, each enclosed in a thin, semi-transparent skin, the whole ear presenting a silvery appearance. Very commonly this skin is broken on many of the grains before harvest, in which case the black mass within becomes more conspicuous. The awn is not usually destroyed, and the sterile spikelets of the ear generally develop normally.

Diseased ears are harvested with the healthy, and in the thresher the spores of the fungus, which constitute the "smut,"

* In a few districts loose smut appears to be commoner than covered smut. Stapledon observes, for example, that this is the case in some Cotswold areas.

FIG. 1.—Loose Smut of Barley. A, B, Ear just emerged. C, Spores germinating. D, Spores germinating. $\times 710$.

FIG. 3.—Loose Smut of Oats. A. Head partially destroyed by smut; B. Spores $\times 700$; C. Germinating spores $\times 700$; D. Conidia budding $\times 700$; E. Germinating conidia $\times 700$.

FIG. 2.—Covered Smut of Barley. A. Smutted ear; B. Spores $\times 710$; C. Germination of spore; D. Conidia budding; E. Germination of conidia.

are set free, many of them finding their way on to the healthy grain. As a rule a number of the smutted heads break up in the thresher, and bits of them with attached masses of black spores are found in the threshed corn. The thoroughness with which the spores are distributed through the grain during threshing is remarkable. In a 1-lb. sample of barley recently examined by one of the writers, two small pieces of a smutted ear were found, indicating that the seed was from a diseased crop. Though the grain was not markedly discoloured, immense numbers of spores were found in water in which half-a-dozen grains had been washed. Badly-smutted grain is often recognisable by its dark colour. Such discoloration is, however, frequently attributed to other causes, such as smoke.

The spores differ from those of loose smut, in that they are rather larger and smooth walled (Fig. 2, B). They germinate readily in water or nutrient solutions. The method of germination varies slightly according to the conditions under which it occurs. In a nutrient solution, such as a decoction of plums or a watery extract of a fertile soil, the spore gives rise to a short tube bearing a succession of small, oval, colourless secondary spores or conidia (Fig. 2, c). The latter become detached, and increase in number by a process known as "budding." A small protuberance appears on the conidium, swells to the size of the parent spore, and then breaks away, to repeat the process indefinitely (Fig. 2, D). In the course of a few days an immense number are thus produced. Eventually the conidia germinate, each producing a germ tube capable of infecting the young barley plant (Fig. 2, E). If the spores are germinated in water, on the other hand, they produce a long tube which branches, but which bears very few conidia; and the latter seldom multiply by budding.

These facts are not without practical significance. As it is the conidia which infect the barley plant it is evident that anything promoting conidia-production will favour infection, and, conversely, that the fewer the conidia produced, the less chance of infection there will be. In the light of these facts is to be interpreted the common belief that heavily-manured crops are more prone to smut than crops on poor ground. Brefeld tested this theory in the case of oat smut (which has a similar life-history), and found that a much higher proportion of smutted plants resulted on ground which had been heavily dunged than on unmanured soil.

The spores retain their vitality for several years. Infection takes place during the seedling stage, the fungus boring into

the barley plant, and making its way to the tip of the stem, while the latter is still below ground. From this point onwards the progress of the disease is similar to that of other varieties of smut. Until the plant commences to form an ear the parasite inflicts no visible harm; but as soon as ear-formation commences the fungus begins to grow more rapidly, and forms great quantities of spores, destroying the tissues of the ear.

Spread of the Disease.—As in the case of bunt in wheat, threshing machines, winnowers, and grain sacks undoubtedly act as disseminators of the disease spores. Infected grain does not appear, however, to be quite as general as bunted wheat. Stapledon* examined 47 samples of barley at Aberystwyth and found that 28 per cent. of them were contaminated with spores of the disease. In the experience of the writers it is far more common than the "loose" smut. In most seasons it is rare to find a barley field quite free from it.

Treatment.—It is evident from the life-history of the fungus that the disease may be prevented by methods similar to those recommended for bunt, *i.e.*, "pickling" the seed. Barley is not quite such an easy subject as wheat to handle, however, being more easily injured by fungicides. Of many possible fungicides, discussion may be limited to two—copper sulphate and formalin.

1. *Copper Sulphate.*—Copper sulphate by itself is an effective but dangerous dressing. A 5 per cent. solution of copper sulphate ($\frac{1}{2}$ lb. to 1 gal. of water) may be used if the seed is thoroughly dusted over with powdered lime after the copper sulphate has been applied. This treatment, however, has little to commend it. Without lime, a 5 per cent. solution of copper sulphate has been found very harmful.

2. *Formalin.*—This is the most satisfactory dressing yet tried. It should be used at the strength of one tablespoonful† to 1 gal. of water. It is applied in the same manner as copper sulphate. Regular treatment of seed barley with this substance is strongly advocated. It is greatly to be regretted that spurious preventive dressings are so extensively used. Some of these claim to give protection against both birds and smut. The writers have not found any dressing satisfactory for both purposes simultaneously. If the two troubles are expected, the grain should be first pickled, then dried, and the "bird" dressing applied afterwards.

* Report on seed tested at the Agricultural Department, University College of Wales, Aberystwyth, Season 1914.

† An ordinary medicine bottle makes a convenient measure.

"Pickling" of seed is more necessary with barley, perhaps, than with any other cereal. Not only does it prevent covered smut, but it is also an excellent preventive measure against the disease known as "stripe" or "deaf ear," which causes great annual loss in many districts.

SMUTS OF OATS.—There are two smut diseases of oats, but it is difficult to distinguish one from the other.

1. **Loose Smut** (*Ustilago Avenæ*, Pers., Jens.).—This is the oat smut common in England. Diseased plants are characterised by the presence of black powder replacing the grain (Fig. 3. A). The chaffy scales around the grain are also more or less destroyed—hence the name "loose." The extent of the chaff destruction is, however, very variable; sometimes the whole is destroyed, sometimes it is scarcely injured.

The fungus causing the disease is characterised by small, brown-black, oval to spherical spores with a thick wall, covered with minute spines (Fig. 3, B). The spores which constitute the black powder are partly blown away before harvest, and the remainder are distributed during the threshing, many of them finding their way on to healthy grains, with which they are eventually sown.

On germination the spore produces a short tube bearing a succession of colourless conidia, which may bud in a similar way to those of *Ustilago Hordei* (Fig. 3, C, D). Infection takes place while the plants are in the seedling stage. Subsequent development of the fungus is similar to that of other smut fungi.

2. **Covered Smut** (*Ustilago lœvis* (Kell. and Swing.) Magn.).—Diseased plants are similar to those attacked by loose smut except that the scales around the grain are less affected. The fungus differs from that of loose smut only in the possession of a smooth-walled spore; the life-histories of the two are said to be identical. This disease does not appear to be common in England.*

Treatment.—Covered smut in oats may be prevented by "pickling" the seed before sowing.

Copper sulphate is not to be recommended for this purpose. Even a 3 per cent. solution has had deleterious effects on germination. In field experiments at Cockle Park in 1916, the crop from seed which had been dressed with a 3 per cent. solution of this substance was thin and poor, charlock and other weeds making great headway in consequence.

* The writers have only met with it twice, and have not used it in experimental work.

In field experiments conducted in 1915 on the Isle of Gigha,* Argyllshire, the sulphate of copper treatment gave such disastrous results that the whole of the area sown with seed thus treated had to be resown.

Copper sulphate is not so effective a fungicide when used on oats as with other cereals.† Apparently this is due to the fact that smut spores lodge in between the scaly husks of the "seed" and are not reached by the liquid.

Formalin in the strength of two tablespoonfuls to 1 gal. of water has proved itself a reliable "pickle." In field experiments at Cockle Park in 1916 no smut was seen in the plot sown with infected seed which had been so dressed, while a scattering of smutted heads was observable in the crop from untreated seed. A sample drawn at the time of sowing from a bulk of seed treated on a field scale at Cockle Park in 1917 gave, in laboratory tests, a germination capacity of 98 per cent., and in the field germination appeared perfectly equal to that of the untreated seed. In this experiment also, no smut was seen on the treated plot, while on the untreated, diseased heads were found scattered throughout the crop.

In the Isle of Gigha experiments quoted above, oats pickled in formalin gave 98 per cent. germination when tested in Government laboratories, and on the farm Mr. Philip obtained a higher yield, both of straw and grain, a higher bushel weight, and a lower proportion of "tails" from the formalin plot than from the untreated, and, in addition, while the untreated crop was badly smutted, no single smutted head was found among the oats treated with formalin.

SMUTS OF RYE.—Hitherto the area of rye grown for grain in this country has been very small, and there is no record of smut having given serious trouble. In view, however, of the largely augmented area at present under rye, and the loss caused by smut in some American States,‡ a note upon the subject may serve a useful purpose. There are two so-called "Smuts" of rye. One, the "Stinking Smut," is caused by *Tilletia separata* (Kunze), a fungus closely related to the fungus of wheat bunt, and having a similar life-history. The spores,

* On the Home Farm of W. J. Yorke Scarlett, Esq. Results kindly communicated by Mr. W. W. Philip, Factor, who devised and conducted the experiments.

† Pickling with copper sulphate frequently produces a very curious effect. When sown the oats develop shoots more or less normally, but no primary roots appear. Adventitious roots may appear upon the young stem later.

‡ Minnesota and North Central States principally.

produced in masses in the kernel, are similar to those of bunt in appearance.

The second rye smut is the work of *Urocystis occulta* (Rabenh.) Plow., a fungus similar in life-history to that causing onion smut. Black streaks are produced on the stems and leaves, consisting of spores, produced in clusters, the central one, two, or three of each cluster being fertile, the remainder empty and sterile. Both diseases are amenable to pickling treatment, and formalin at a strength of 2 tablespoonfuls per 1 gal. of water will probably be found satisfactory.

Summary of Smut Diseases of Cereals.

Crop.	Disease.	Characteristics of Disease.	Treatment.
Wheat.	Bunt ..	Contents of grain replaced by black powder. Infection from spores present on seed when sown.	Pickle seed with:— (a) formalin (2-3 tablespoonfuls per 1 gal. of water); (b) copper sulphate (1 lb. per 1 gal. of water).
	Loose Smut or "Smutty Collier."	Ear completely destroyed except for central stalk. Infection during flowering stage; infected grains develop normally and are harvested with healthy grains.	Soak seed for 3-4 hours in cold water then place in water at 126°-129°F. for 10 minutes.
Barley.	Covered Smut.	Grains destroyed; masses of spores which take their place remain intact till the crop is threshed. Infection from spores present on seed when sown.	Pickle seed with formalin (1 tablespoonful per 1 gal. of water).
	Loose Smut.	Almost identical in appearance with loose smut of wheat. Infection during flowering stage.	Treatment as for loose smut in wheat, except that the temperature of the water should be kept at 124° F.
Oats.	Loose Smut.	Grain and more or less of surrounding chaff destroyed. Infection from spores on seed when sown.	Pickle seed with formalin (2 tablespoonfuls per 1 gal. of water).
	Covered Smut.	Chaff less destroyed, otherwise similar to loose smut. Infection from spores on seed.	Pickle as for loose smut.
Rye.	Leaf Smut.	Powdery black streaks on stem and leaves. Spore clusters present on seed.	Pickle seed with formalin (2 tablespoonfuls per 1 gal. of water).
	Stinking Smut.	Similar to wheat bunt. Infection by spores present on seed when sown.	Pickle as for leaf smut.

FURTHER NOTES ON THE POWDERY MILDEWS AND THE AMMONIUM POLYSULPHIDE WASH.

J. VARGAS EYRE, Ph.D., E. S. SALMON, and
L. K. WORMALD,

Research Department, South-Eastern Agricultural College, Wye, Kent.

MENTION has already been made in this *Journal** of the discovery of a new wash—ammonium polysulphide—which is fungicidal for “powdery mildews” (*Erysiphaceae*), such as American Gooseberry-mildew, Hop-mildew, etc.

It was then pointed out that while the lime-sulphur wash was regarded (as it still is at the present time) as undoubtedly the best general wash against mildews for use early in the season, the ammonium polysulphide wash was valuable for use later in the season to protect the ripening gooseberries (particularly the later dessert varieties), since this wash, unlike the lime-sulphur wash, leaves no visible deposit on the berries. A formula was then given for making an ammonium polysulphide solution sufficiently concentrated to be diluted 20 times in order to make a summer wash of fungicidal strength.

During the past three years further investigations have been continuously carried out on the subject of the control of powdery mildews by sulphur-containing washes. The object of the present article is to point out to farmers and others (1) that new facts have been discovered relative to the “killing point” of powdery mildews, and (2) that an improved formula has been found for making the concentrated ammonium polysulphide solution.

It became clear during the course of the investigations that a powdery mildew varies in power of resistance to a fungicide according to its stage of development. The work was carried out with the hop-mildew (*Sphaerotheca Humuli*, [DC.] Burr.) and the following facts, illustrating the above point, are taken from the life-history of that mildew; there is every reason to believe, however, that the same fact holds good in the case of other mildews.

Like all powdery mildews, the hop-mildew is propagated by minute bodies called *spores*, each of which acts like a seed of the higher plants in giving rise to a new individual. When a spore reaches the surface of a young, healthy hop-leaf, it begins

* See this *Journal*, February, 1916, p. 1118, and February, 1917, p. 1098.

to grow by putting out a little "root," the *germ-tube*, which fixes it to the surface of the leaf, and from the tip of this germ-tube it sends a *sucker* into the leaf to extract from its sap the food-material it requires. In the case of a rapidly-growing young hop-leaf a small convex "blister" or "hump" results at the place where the infection takes place. At first this "hump" is green, but very soon a delicate, white growth, consisting of extremely fine, radiating threads, can be seen extending over its surface. This white growth is the first-formed "spawn" (*mycelium*) of the young mildew-patch. Proof has been obtained that during this stage of development, viz., from the germination of the spore to the production of the very young, sterile "spawn" (*mycelium*), the mildew offers the maximum resistance to the fungicide, requiring not less than double the strength which is lethal in the later stage.

The next stage of development of the mildew is the gradual production of chains of spores, produced in a necklace-like string on upright branches from the creeping "spawn" on the surface of the leaf. The spores thus produced fall off when ripe and collect in little powdery masses, giving that "frosted," "mealy" or "powdery" appearance to the mildew, so familiar to the farmer when he finds the mildew "running" through his hop-garden or gooseberry-plantation. The spores are soon carried about by the wind and so spread the disease. In this "powdery" stage the mildew, particularly if it is growing on the older leaves, is more easily killed by the wash.

The concentrated ammonium polysulphide solution made on the improved formula given below can be diluted at the rate of 1 gal. to 100 gal. of water, at which strength it is fungicidal for all "powdery" mildew-patches (even on the youngest leaves where they are more difficult to kill than on the older leaves). At this dilution it will not kill the mildew in its earliest stages of development, consequently a second application should be given at the end of a week or ten days, by which time the mildew patches in the earlier stages of development will have grown into "powdery" patches. Greenhouse experiments have proved that the solution at double the above strength is almost, if not quite, fungicidal for all stages of the mildew.

A general recommendation can be given to use the above wash in two applications at the strength of 1 to 100; experiments on a small scale using the wash in one application at the strength of 1 to 50 might profitably be made by the farmer. The method of preparing the wash at both strengths is given below.

Preparation and Dilution of the Ammonium Polysulphide Solution.—

Stock Solution.—One gal. of a 30 per cent. solution of ammonia in water is saturated at ordinary temperature with sulphuretted hydrogen gas until the density of the solution is 0.955. Two gal. of 30 per cent. aqueous ammonia are then added and 112½ oz. of “flowers of sulphur” stirred into the liquid. A further current of sulphuretted hydrogen gas is then passed through the fluid until all the sulphur dissolves and the density of the solution becomes 1.036 at 17° C. (63° F.). The clear, dark-coloured solution which results constitutes the new stock solution, and may be referred to as the ammonium polysulphide stock solution 1918 (A.P.S., 1918). In the preparation of this solution, care should be taken to avoid the use of copper utensils and to exclude, as far as possible, free access of air to the vessels during the manufacturing process.

When made according to the above directions, stock solution A.P.S., 1918, should contain 19.2 per cent. of ammonia and 24.2 per cent. of sulphur, of which 10.6 per cent. is in the condition known as sulphide sulphur and 13.6 per cent. in the form known as polysulphide sulphur. This stock solution is miscible with considerable quantities of water without becoming turbid. After standing for about twelve hours when diluted to the extent of either 1 part to 50 parts of water, or 1 part to 100 parts of water, the fluid may become cloudy and finally thick with a deposit of sulphur.

Dilution.—Strength (a).—To prepare this diluted wash from the stock solution, 5 lb. of soft soap are dissolved in 99 gal. of water, and into this soap solution 1 gal. of stock solution A.P.S., 1918, is mixed by stirring. In this manner 100 gal. of wash are prepared, ready for use, containing 0.5 per cent. of soft soap. Two applications should be given, at intervals of a week or ten days.

Strength (b).—Two-and-a-half lb. of soft soap are dissolved in 49 gal. water, and into this soap solution 1 gal. of stock solution of A.P.S., 1918, is mixed by stirring. In this manner 50 gal. of wash are prepared, ready for use, containing 0.5 per cent. of soft soap. One application should be sufficient.

Both the above diluted washes must be applied *as soon as made*. It is absolutely necessary to use the soap solution with the wash, as otherwise the mildew-patches are not properly wetted. Where the water is very hard, twice the amount of soap given above should be used.

It will be obvious from the above that the stock solution is not of a kind which growers can make for themselves, and the

point must be emphasised that since it cannot be practically tested by the grower, it should be purchased only from firms of repute who will vouch that it has been prepared according to the methods described above and that it contains the essential ingredients in the proportions given.

Transport.—The means adopted for the transport of the stock solution and the precautions to be taken when handling it should be in every way identical with those adopted in the case of lime-sulphur.

Application. — In applying the ammonium polysulphide and soft-soap solution as a summer wash, a nozzle giving a very fine, "misty" spray should be used. The receptacle used in spraying must be wooden or iron (galvanised iron or tin). A copper knapsack sprayer must not be used, because, just as in the case of the lime-sulphur wash, the dissolved sulphur acts on this metal.

All insecticidal substances which can be added to the lime-sulphur wash, such as arsenate of lead or nicotine, may, if required, be added to the ammonium polysulphide solution.

In dealing with American Gooseberry Mildew, the lime-sulphur wash may be used for the early sprayings, as this wash has now been proved to be thoroughly reliable in dealing with this mildew. When the use of lime-sulphur interferes with the marketing of the berries, the ammonium polysulphide and soft-soap wash should be used. Since some varieties of gooseberries are liable to be injured when sprayed with sulphur-containing washes, the first application should always be on an experimental scale.

OWING to the high cost of nitrogenous fertilisers, farmers should endeavour to conserve nitrogen by every means possible. Leguminous plants should, therefore, take a prominent place in every rotation. It is well known that in many districts Red Clover is liable to become "clover sick" if sown on the same field at too short intervals. It is probable that none of the leguminous forage plants are absolutely safe from attacks of "clover sickness," but it is evident that Red Clover is the most susceptible. Peas or beans, both valuable crops under existing conditions, could with advantage be introduced into the rotation on land that is known to be "sick" provided that it is at the same time suitable for the production of these crops

**Seed Mixtures for
Land affected by
Clover Sickness.**

while in the formation of rotation leys, plants other than Red Clover should be used on "sick" land; or a mixture consisting only partially of Red Clover should replace large seedings of Red Clover by itself. Alsike Clover, White Clover and Trefoil do not suffer from "clover sickness" to nearly the same extent as Red Clover, and may, therefore, be used as substitutes for Red Clover.

Moreover, there is reason to believe that English-grown Late-flowering Red Clover in particular and also Broad Red Clover, from seed harvested in England, are less susceptible to "clover sickness" than imported Clover. When, therefore, Red Clover is used at all in mixtures for "sick" land it is desirable that every endeavour should be made to secure home-grown stocks of seed for the purpose. On chalky soils, or in regions of comparatively low rainfall, Trefoil may be largely used, while in districts of high rainfall more reliance should be placed on Alsike Clover. The following mixtures are suggested:—

One Year Leys.—

<i>Chalky Soils or Low Rainfall.</i>			<i>High Rainfall.</i>		
	<i>lb. per acre.</i>		<i>lb. per acre.</i>	<i>lb. per acre.</i>	
Red Clover ..	4	} or {	Alsike Clover ..	4	{ Red Clover .. 4
Alsike Clover ..	6		Trefoil ..	12	
Trefoil ..	6				

It appears also from experiments conducted in Yorkshire and from experience elsewhere that Red Clover grown in conjunction with Rye-grass is less susceptible to sickness than when grown pure; in districts adapted for growing mixed "seeds" the Clovers might be decreased to half the above quantities and a $\frac{1}{2}$ -bush. of Italian Rye-grass added to the mixture.

Two Year Leys.—White Clover should be more largely relied upon in mixtures for two-year leys, in which mixtures both Italian and Perennial Rye-grasses would also take a prominent place.

<i>Low Rainfall.</i>			<i>lb. per acre.</i>	<i>High Rainfall.</i>			<i>lb. per acre.</i>
Red Clover	2		Red Clover	2	
Alsike Clover	3		Alsike Clover	4	
White Clover	2		White Clover	2	
Trefoil	3		Italian Rye-grass	6	
Italian Rye-grass	6		Perennial Rye-grass	4	
Perennial Rye-grass	4					

On soils where Giant Sainfoin is known to succeed, especially where it has not been grown for a number of years, this crop

sown pure might usefully replace Red Clover on "sick" land, whilst the value of Lucerne on soils that suit it must, in this connection, be strongly emphasised. The Vetch is another valuable leguminous plant which, as well as providing nitrogenous residues for the benefit of subsequent crops in the rotation, has a special value at present from the point of view of adding to the diminished supplies of hay.

(This Article is also issued as Food Production Leaflet No. 61.)

Top Dressing for Cereals.—Farmers who have not yet applied top dressings to their cereal crops should look over their fields carefully with a view to giving early dressings wherever necessary. The earlier the top dressing is put on the better: one of the reasons why crops in the past have not benefited from spring dressings as much as might have been expected is that the application has been delayed till they had already begun to suffer from want of help. The proper time to use spring dressings is before the plant shows signs of suffering, and this involves an intelligent appreciation of the conditions to which it has been subjected, and the way in which it is likely to behave when it starts growth.

Ammonium Nitrate as Top Dressing.*—The Ministry of Munitions is offering ammonium nitrate at £25 per ton; this is therefore, the cheapest nitrogenous fertiliser on the market, the nitrogen working out at 14s. 4d. per unit—a price equivalent to sulphate of ammonia at £14 6s. 8d. per ton, and to nitrate of soda at £11 9s. per ton—figures which are considerably below present prices.

A suitable dressing is $\frac{1}{2}$ cwt. per acre; this quantity is not, however, easily applied by any ordinary manurial drill. The bulk must, therefore, be doubled by mixing it with dry earth or ashes, or if need be with dry superphosphate; basic slag, however, must not be used as it would cause loss of ammonia.

Superphosphate as a Constituent of Top Dressings.—Superphosphate can advantageously be used as a top dressing to cereals where the corn has lain wet for some time, and where, therefore, root action has been delayed. It has the useful property of

* See note on p. 1515 of this Journal.

helping the young roots to develop, thereby enabling the plant to make an earlier start than would otherwise be possible. The plant also ripens earlier—a great advantage in wet districts. A suitable dressing is usually about 2 cwt. per acre. In most cases a nitrogenous dressing, such as nitrate of soda, nitrate of ammonia, or sulphate of ammonia, should be given at the same time.

Superphosphate is also likely to be wanted for corn-growing on land ploughed out of grass last year or two years ago. Usually such land contains insufficient phosphate for the needs of the arable crops: here also a suitable dressing is 2 cwt. per acre, and, in addition, a nitrogenous fertiliser may also be needed.

Superphosphate for Grass Land.—Some farmers are experiencing difficulty in obtaining basic slag for their grass land. It is not anticipated that the difficulty will continue long, as the total output is greater than that of last year, and, indeed, the total deliveries are greater also; but in the meantime farmers who cannot obtain slag, and who know that phosphates are needed for their land, can often use superphosphate instead. It should be given at about half the rate at which slag would be applied.

Land laid up for hay may advantageously receive a nitrogenous dressing in addition— $1\frac{1}{2}$ cwt. of sulphate of ammonia or $\frac{3}{4}$ cwt. of nitrate of ammonia.

Dressings for Potato and Root Crops.—It is now necessary to make arrangements for the supply of artificial fertilisers to the root crop. Two general rules should be borne in mind:

1. Phosphates increase the feeding value of the crop and should, therefore, always be given to swedes, turnips, rape, kohlrabi and other crops grown for animal consumption.
2. Nitrogenous fertilisers increase the crop, and so long as they are properly used they do not detract from its feeding value: there is no ground for the belief sometimes held that fodder crops grown with artificial manures are necessarily unsatisfactory from the feeding point of view.

A suitable dressing for the above *fodder crops* grown for sheep or cattle would be $2\frac{1}{2}$ to 4 cwt. of superphosphate and 1 cwt. of nitrate of soda or sulphate of ammonia or $\frac{1}{2}$ cwt. of ammonium nitrate. Even where farmyard manure has been applied, it may prove necessary to give artificial manures to swedes and turnips; the farmer who wishes to make the best of his scheme of manuring should ascertain this point by direct trial.

Mangolds can do with both farmyard manure and artificials ; they respond to liberal treatment, and it is often an advantage to the dairyman to have a heavy crop in a particular field. They require superphosphate at the rate of 2 to 2½ cwt. per acre to bring them on early, and they can also make good use of nitrogenous manures : from 1 to 2 cwt. of sulphate of ammonia or nitrate of soda can be used, or ½ to 1 cwt. of nitrate of ammonia. In addition, mangolds respond to salt in quantities of 2 to 4 cwt. per acre : salt should not be omitted, as it helps to economise the supplies of potash which must now be somewhat depleted in some of our own soils.

Potatoes also respond to both farmyard manure and artificials. They can advantageously receive more superphosphate than would be given to mangolds : a suitable dressing would be 2½ to 4 cwt. per acre. Potatoes do not need so much nitrogenous manure as mangolds : if given too much nitrogen they are apt to produce excessive tops. About 1 cwt. of sulphate of ammonia would commonly suffice, though the amount varies in different districts, and growers must be guided by good local practice. Potash is also required, and it is hoped that supplies will be available in sufficient quantity to meet all demands.

CAMBRIDGESHIRE is a county in which much drainage work is necessary, and the Executive Committee of the War Agricultural Committee, realising the importance of improving the waterways throughout the county, have been very active during the last two years. A brief review of the drainage work carried out by the Committee may be of interest.

In November, 1917, a small prisoner camp was established at Meldreth, and by August, 1918, the Mel, a stream 2 to 3 miles in length, was scoured and cleansed. Overhanging and unsound trees were removed from the water's edge, and the banks were repaired. It was found possible to dam and by-pass the water during the summer months ; and the accumulation of mud was thrown or wheeled out in barrows. This work was carried out under Orders issued on frontage occupiers under the Defence of the Realm Regulations.

Early in 1918, at the request of a number of owners and occupiers, the Committee took in hand the improvement of Isleham Fen, an area of about 3,500 acres with a variety

of fen soils. There are about 100 occupiers of land within the area; and a portion of the Fen is market-garden land. The Fen lies at a height varying from 1 to 12 ft. above sea level. Portions of the Fen have been lowered by paring and burning, and by digging for fuel.

The Board of Agriculture, at the suggestion of the County Executive Committee, issued an Order in June last prohibiting the paring and burning of Fen land in Cambridgeshire, except with the permission of the Committee. A survey of the Fen was made and levels were taken. The work is now (February, 1919), after 10 months, nearing completion. Some 11 miles of main drains, with a top width varying from 9 to 14 ft., have been opened out, deepened and widened, and the sides given a correct batter. The water in the drains is held up by dams, which are drawn at night. No fewer than 48 gateway tunnels have been fixed in the drains. These are elm trunks of uniform size, no other form of tunnel having been found to be suitable in Fen land. A number of these tunnels are supplied with slats which fix into a frame in order to hold up water for stock in dry weather. The Fen is approached by a number of wide parallel Fen droves, on either side of which are usually found the main drains. The droves are common for stock grazing, and a number of drinking-places have been made and fenced off from the drains.

For the drainage of the Fen it has been found necessary to open an old catchwater drain on the edge of the Fen. In its course through a gravel hill the sides had slipped in and the drain was overgrown, and for many years the upland water had flowed into the Fen instead of being conveyed along its edge by the catchwater drain. Now that the old catchwater has been opened the Fen land will be relieved of this water and only in times of drought will water be passed into the Fen from the catchwater.

There still remains to be dealt with an area of about 300 acres at the northern and lower end of the Fen. For the drainage of this area it will be necessary to erect a small pumping station to lift the water into the main drain, which is carried across the area at high level and is ultimately raised into the River Lark by the pumping station at Prickwillow.

Tenure of Allotments.*—*Mr. T. Griffiths* asked the President of the Local Government Board whether he will consider the advisability of taking steps to secure fixity of tenure for allotment holders, and to make it obligatory upon local authorities to provide land for allotments at fair rents?

Sir A. Griffith-Boscawen: The Board cannot undertake to secure fixity of tenure for allotment holders in view of the fact that the land may be required for building in the near future. As regards land taken under the D.O.R.A. Regulations the Board intend to retain possession for two years after the end of the War, except where the land is required for building or where the compensation payable would be excessive. With regard to the second part of the question, local authorities are already charged with the statutory duty of providing allotments, and it is proposed to extend their powers of acquiring land for this purpose in the Land Settlement (Facilities) Bill. (18th February.)

Sir Kingsley Wood asked the Parliamentary Secretary to the Board of Agriculture whether the Board investigates each case where an allotment holder receives notice to quit his allotment under the Cultivation of Lands Order; whether in each case it must be proved that the land is required for a better purpose than food production before it is released from the obligations of the Order; whether he will make representations to the local authorities that allotment holders under the Order should be permitted to cultivate the land until it is actually required for some more necessary public purpose than food production; and whether, in the event of an allotment holder being dispossessed, he will impress on local authorities the necessity of the dispossessed holders being provided with an equivalent amount of suitable land wherever possible?

Sir A. Griffith-Boscawen: The Board cannot undertake to investigate each case, but the local authorities who administer the Order have been informed by the Board of the course they should adopt. As regards the latter portion of the question, it is the statutory duty of the local authorities to provide land to meet the demand for allotments, but in urban areas there is often not sufficient land available to provide for all the applicants. (27th February, 1919.)

Wheat.—*Colonel Wedgwood* asked the Prime Minister why, while the law guarantees a price of 55s. a qr., His Majesty's Government is in fact guaranteeing a price of 75s. 6d. a qr.; and whether His Majesty's Government are putting any obstacles in the way of the importation of cheap corn into the country?

Sir A. Griffith-Boscawen: The price of the 1919 wheat crop represents the considered opinion of the late Government on the price that would be necessary in 1919 to induce the farmers to grow wheat as extensively as in 1918. I am informed that His Majesty's Government is selling imported wheat and flour to the public at less than cost price. Fifty-five shillings per qr. in the Corn Production Act is calculated on a qr. of 480 lb. The 75s. 6d. mentioned by the hon. and gallant Member is based on the qr. of 504 lb. The corresponding figure is therefore, 73s. (21st February.)

Wheat Prices.—*Mr. Cauley* asked the Parliamentary Secretary to the Board of Agriculture (1) whether he can now announce the steps the

* See also p. 1520.

Government are taking to ensure to farmers a market at the present controlled price for the 1918 wheat which they were compelled to grow ;

(2) whether, in consequence of the millers being filled up with the foreign wheat which he has put on the market, farmers are unable to sell the 1918 wheat which they were compelled to grow, or sell it at prices from 5s. to 8s. below the present controlled price ; whether this is causing great hardship ; and whether he can see his way to temporarily keep back foreign wheat, or to order that millers shall mix with it a fixed percentage of English wheat, or take some other steps to enable farmers to sell their 1918 wheat at the present controlled price ?

Mr. McCurdy : I have been asked to reply, and will answer these questions together. On the average, approximately 30 per cent. of home-grown wheat is being used in all the mills in the United Kingdom at the present moment, and at this rate all the wheat grown will be required in due course. The present controlled price, *i.e.*, maximum price, a mean of 76s., is considerably in excess of the price guaranteed by Statute to the 1918 harvest, namely, 55s. per qr. of 480 lb., or 57s. 9d. per 504 lb., the latter being the weight fixed for maximum prices applicable to the 1918 crop.

Mr. Cautley asked the Parliamentary Secretary to the Board of Agriculture when he will be able to make a statement of the Government's policy as to the price for 1920 wheat ; and whether he will bear in mind that such statement should be made in the next two or three weeks so as to enable farmers to decide how much, if any, land they will set aside for fallowing and preparing for wheat to be sown next autumn ?

Sir A. Griffith-Boscawen : The only guarantee that can be given at present is that provided for in Section 2 (1) of the Corn Production Act, 1917. (3rd March, 1919.)

Ploughing Orders.—*Mr. Wilson-Fox* asked the Parliamentary Secretary to the Board of Agriculture whether he is aware that Orders for the ploughing up of grass land are still being given by Agricultural Committees ; and why this action is being taken at a time when the supply of corn available or in sight is generally understood to be ample for the requirements of the country ?

Sir A. Griffith-Boscawen : It is still in the national interest that as much land as possible in this country should be kept and brought under the plough, in view of the probable demand of other countries on the exportable surplus of the world. The need for increased production remains, and the Board have, therefore, informed the Agricultural Executive Committees that, while it is impracticable at present to compel farmers generally to plough more grass land, orders may be issued in special cases. I may remind my hon. Friend that all ploughing Orders are now subject to a right of appeal to an independent arbitrator. The policy of the Board on the matter is set out in a Circular Letter issued by the President on the 1st instant.*

Captain Terrell asked the Parliamentary Secretary to the Board of Agriculture, what steps he proposes to take to ensure that the land ploughed up during the War is not allowed to revert to grass ?

Sir A. Griffith-Boscawen : Agricultural Executive Committees are authorised by Regulations issued under the Defence of the Realm Act to maintain in arable cultivation any grass land which has been ploughed up. (13th February.)

Major Wheeler asked the Parliamentary Secretary to the Board of Agriculture whether the Board had received in December a resolution passed by the Council of the Central Chamber of Agriculture protesting against the attitude taken up by the Food Production Department of the Board in cases of a change of tenancy by refusing to recognise the right of the incoming tenant to compensation for loss of crop on land ploughed out by Order on the ground that the Order to plough out was served on the outgoing tenant; and, if so, what action the Board have taken to remedy this injustice to the incoming tenant?

Sir A. Griffith-Boscawen: The Board received the resolution referred to. The right of the incoming tenant depends on varying circumstances which cannot be set out in the limits of an answer. The position of the Board is stated fully in a letter which they have sent to the Royal Agricultural Society.

Mr. Lambert asked the Parliamentary Secretary to the Board of Agriculture whether compensation will be available to cultivators of land who, by the Order of the County Executive Committee, ploughed and cropped unsuitable land, losing heavily in the process last year?

Sir A. Griffith-Boscawen: Yes, Sir. The Board are liable to pay compensation to any person who suffers any such loss by reason of the exercise of the powers of any executive committee.

Mr. Lambert: To whom should application be made in these cases?

Sir A. Griffith-Boscawen: It should be made to the Board. (18th February.)

Market Gardeners' Produce.—*Mr. Gwynne* asked the Parliamentary Secretary to the Board of Agriculture whether, seeing that market gardeners are paying the increased wages as provided by the Corn Production Act to their workmen, he will state what steps are to be taken to secure them a fair price for their produce; and if it is intended in the near future to take steps to prevent the dumping of foreign-grown produce in this country?

Sir A. Griffith-Boscawen: The Board are considering what steps can be taken to improve the system of marketing fruit and vegetables. I am not in a position at present to answer the second part of the question.

Mr. Gwynne: Is the Board considering the second part of the question?

Sir A. Griffith-Boscawen: It is part of a much larger question which affects not only the question of fruit, but other imports, and the matter is being considered by the Government. (18th February.)

Home-grown Fruit and Vegetables.—*Mr. Gwynne* asked the Parliamentary Secretary to the Board of Agriculture whether, in view of the probability of the dumping of foreign fruit and vegetables in this country, he will take steps to arrange for preferential rates for fruit and market-garden produce grown in this country?

Sir A. Griffith-Boscawen: It is not within the powers of the Board to determine railway rates or to arrange for preferential rates for home-grown produce, but they will continue their endeavours to ensure equitable treatment for British growers. (18th February.)

Potatoes.—In reply to *Lieut.-Col. Weigall*, *Mr. McCurdy* said: The Food Controller has received representations from various agricultural organisations throughout the United Kingdom concerning the removal of potato crops which is proceeding as quickly as possible. I may point

out that a large surplus crop of potatoes has been grown in the United Kingdom generally, and that, in view of the Armistice, there has of necessity been a reduction in the demand. Every effort is being made by the Ministry to obtain markets abroad to enable stocks of potatoes in the growers' hands to be disposed of as quickly as possible. Instructions have been issued through the Potato Control Committees as to the procedure for making claims in respect of abnormal wastage of potatoes which have been put in the clamps in sound condition. I am aware that owing to the prevalence of blight in the crop this year, particularly in the Eastern Counties, considerable damage may have accrued. (18th February.)

Mr. John Dennis asked (a) if one of the conditions under which farmers were asked to meet an urgent national situation by extending their potato acreage in 1918 was that after 1st November of that year the Ministry of Food would bear the risk of damage other than normal wastage; and (b) whether officials of the Ministry throughout the country, to encourage producers, defined abnormal wastage as being all wastage other than loss of weight through evaporation?

Mr. Roberts : The answer to the first part of the question is in the affirmative, and to the second part in the negative. The conditions under which the Food Controller will accept claims for abnormal wastage are set out in the first note to the Schedule of the Report of the Joint Commission appointed on 19th July, 1918, by the President of the Board of Agriculture and Fisheries and the Food Controller, for the purpose of fixing prices to be paid to growers of potatoes in England and Wales.* The note reads as follows : (a) " The increments fixed in the above schedule must be accepted as covering compensation to the grower for wastage and loss, in pits and for deferred delivery. Price, weight, and condition are to be determined in accordance with the scale set out above as at the date when delivery is taken. No grower is entitled to claim further compensation for any losses save those which are quite exceptional in character. In such cases it will be the duty of the grower, when making application for compensation, to satisfy the Government that (1) the site of the pit has been properly chosen ; (2) the potatoes were in sound condition when pitted ; and (3) due care was exercised in constructing the pits and in examining the condition of their contents from time to time." (19th February.)

Answering *Mr. John Dennis*, *Mr. McCurdy* said : The Food Controller is aware that, as a result of blight, the quantity of unsound potatoes in the clamps is in excess of the normal ; and is certainly of the opinion that these potatoes should be used for cattle feeding where possible. There is nothing to prevent the farmer from at once selling unsound potatoes or using them for his cattle, and in order to avoid any misunderstanding I will have a further notice issued to farmers on this subject. I may add that the question whether the farmer has a claim against the Ministry for abnormal wastage will be settled by the Ministry in each case. (20th February.)

Mr. McCurdy added in reply to *Captain Coote* : The policy of the Ministry of Food in regard to potatoes is to reduce the surplus throughout the country as quickly as possible, and large quantities of potatoes are being exported to France and other destinations. If the hon. Member will be good enough to give particulars of any case in which great

* See this *Journal*, December, 1918, p. 1116.

hardship is being caused to a smallholder, I will have inquiries made. (20th February.)

Wart Disease of Potatoes.—*Commander N. Craig* asked the Parliamentary Secretary to the Board of Agriculture whether, until the year 1918, the potato crops in the county of Kent had been free from Wart Disease; whether, in the year 1918, no less than eight centres in Kent were found to be affected with this disease; whether the soil in certain districts in the Midlands, in the North of England, and in Scotland has become so infected that the cultivation of heavy cropping varieties of potatoes is being abandoned; whether the curative or protective measures of the Board have hitherto consisted in the planting of immune varieties of potatoes or some other arable crop; whether varieties of potatoes, themselves immune, may convey, and whether the soil in which they are grown may convey, Wart Disease; whether infection in the county of Kent has been traced to a consignment of four tons of Scottish Arran Chief seed potatoes found to be affected badly with Wart Disease; whether other, and how many other, consignments of Scottish seed have been found in 1918 on inspection to be diseased; and whether he will take necessary and effective measures to prevent seed potatoes from northern districts being sent into the South of England?

Sir A. Griffith-Boscawen: Wart Disease was first reported among the potato crops in Kent in 1914. Eight cases were reported in 1918—including one case in the administrative county of London. In certain districts in the North of England the planting of susceptible varieties has been prohibited, but the approved immune varieties that are allowed to be planted in these areas include some of the heaviest cropping varieties under cultivation.

The chief protective measure adopted by the Board consists in encouraging, and in scheduled areas enforcing, the growth of immune varieties, and this has proved eminently successful. The disease may be conveyed from one area to another either through the "seed" or through the soil, but the Board have no information which would lead them to believe that the appearance of disease in any district may be attributed either to the importation of diseased soil or to the planting of "immune" varieties.

As regards movement from the infected areas of the North of England under the Wart Disease of Potatoes Order of 1918, the planting of potatoes grown in an infected area is prohibited except in that or in another infected area. In several cases infection has been traced to "seed" imported from Scotland, especially of the "Arran Chief" variety, and the Board have under consideration the issue of an Order prohibiting the movement into England and Wales of "seed" of the susceptible varieties from Scotland without due safeguards.

Army Mares.—*Captain Sir B. Stanier* asked the Parliamentary Secretary to the Board of Agriculture whether half-legged mares are now being issued to farmers; and how many are now out, and how many there are ready to go out?

Sir A. Griffith-Boscawen: Surplus Army mares of light-draught types are being issued to farmers and others for breeding purposes on prescribed conditions. Sixty-eight of light-draught type have been allotted to agricultural executive committees for issue. Twenty others of light-draught type have been selected as suitable and will be issued at an early date. (14th February, 1919.)

Milk.—*Captain R. Terrell* asked the Prime Minister whether the Cabinet have taken into consideration the question of the control by the State of the milk supply; and, if so, whether, before arriving at any decision, he proposes to hear the views of those more especially interested?

Mr. McCurdy: I have been asked to reply. The answer to the first part of the question is in the negative. The Food Controller is arranging that the question of future control shall be considered in the first instance by an interdepartmental Conference comprising representatives of the Ministry of Food, the Local Government Boards, and the Departments of Agriculture. Legislation will, of course, be necessary before State control of the milk supply can come into effect, and full opportunity for discussion will be given. (20th February, 1919.)

Definition of "Market Gardener."—*Captain Reginald Terrell* asked the Parliamentary Secretary to the Board of Agriculture what is the definition, as accepted by the Agricultural Wages Board, of a market gardener; and how are the wages of men defined when the employer carries on with the same staff the joint business of farming and market gardening?

Sir A. Griffith-Boscawen: The Agricultural Wages Board have not finally accepted a definition of a market gardener. They have published a notice of proposal to fix a differential minimum rate of wages for workmen of 21 years and over in Essex, who are employed wholly or mainly in connection with the use of land for a market garden, by an employer who is engaged in the trade or business of market gardening. Any objection to this proposal may be lodged before the 4th March next. After that date the Agricultural Wages Board will consider all objections and decide whether an Order shall be made on the subject; and, if so, in what terms. (21st February.)

Land Settlement of Ex-Service Men.—*Sir Richard Cooper* asked the Parliamentary Secretary to the Board of Agriculture if he will say how many ex-Service men have actually been settled on the land under arrangements made by the Board; for what number arrangements are in negotiation; and how many are pursuing courses of training with assistance from the Government, with a view to their taking up positions in agriculture or allied occupations?

Sir A. Griffith-Boscawen: The settlement of ex-Service men on the land is being carried on mainly through the county councils and it is not possible therefore to answer the several points raised by the hon. Baronet.

The Board have established four colonies on which about 65 men are being employed with a view to subsequent settlement; and they have approved of over 200 officers for training with selected farmers. Courses of training have been started through the Ministry of Pensions and the Board, but it is not possible to give precise numbers of the personnel being so trained. As regards the acquisition of land, the Board and the councils are actively engaged in acquiring any suitable land that is available for the purpose in view. (3rd March, 1919.)

Agricultural Training for Ex-Officers.—*Mr. Cautley* asked the Parliamentary Secretary to the Board of Agriculture what financial assistance will be given by the Board to ex-officers of the Army, Navy, and Air Force desiring to be trained in agriculture for such posts as officers of the Board, county officials, estate agents, and managers; and what are the prospects of such employment being available?

Sir A. Griffith-Boscawen : The Board have obtained authority to award fifty scholarships, of a value varying up to £175 per annum and fees, to be held at universities and agricultural colleges to ex-officers and men of educational promise wishing to take up a career of the nature indicated by the hon. Member, and they are prepared, subject to Treasury approval, to increase this number up to 100 if necessary. These scholarships are intended for candidates who have some previous scientific knowledge, or practical training, or both. Particulars are given in a booklet, entitled "Land Settlement in the Mother Country—Officers," which has been widely circulated.* Appointments cannot, of course, be guaranteed at the end of training, and the Board are strongly of opinion that the number of posts—official and other—likely to be available does not justify them in encouraging more than a small number of ex-officers or men to seek a career in this direction. I am glad of an opportunity to make this public statement, as very many applications and inquiries for salaried appointments in agriculture are now being received, and it is most desirable that it should be known at once that openings of the kind are bound to be comparatively few. (13th February.)

Entertainments Duty and Agricultural Shows.—*Colonel M. J. Wilson* asked the Parliamentary Secretary to the Board of Agriculture whether he is aware that, owing to the incidence of the Entertainments Tax, it is proposed to abandon many of the local produce and agricultural shows for this year; and whether, in view of the advantage of holding these shows, he can make any statement on the matter?

Sir A. Griffith-Boscawen : The Commissioners of Customs and Excise have informed the Board that they have no power to exempt an agricultural show from the Entertainments Tax, except under Section 1 (5) (d) of the Act, which requires them to be satisfied that it is provided for partly educational or partly scientific purposes by a society not conducted or established for profit.

In estimating the title of any particular show to exemption under this provision, they will have regard to the nature of the show as a whole, and their decision will largely turn on whether the show is confined to exhibitions of a partly educational character, or whether it comprises elements of a nature designed to afford amusement rather than education, and to attract the general public rather than persons interested in the study or the practice of agriculture.

The managers of an agricultural show should apply to the Customs and Excise Department for exemption from the Entertainments Tax, furnishing with the application a programme of the show, stating whether music, sports, and other extraneous amusements will be included in the proceedings, and also sending a financial statement showing whether the society is conducted for profit, together with a copy of the rules.

Mr. Pretyman : Is my hon. Friend aware that it is not only the sums paid for entrance, but the annual subscription on which these shows depend, and will he look into the question from that point of view?

Sir A. Griffith-Boscawen : It is really a matter for the Customs to decide.

Colonel Weigall : Who is to decide whether a show is educational?

Sir A. Griffith-Boscawen : I should like notice of that. (3rd March, 1919.)

* A ~~review~~ of this booklet appeared in this *Journal*, February, 1919, p. 1311.

Forestry.—*Major Lane-Fox* asked the Prime Minister whether he is aware of the need for the prompt setting-up of the new forestry authority, in view of the probable shortage of seedlings in the near future and the acreage of recently felled woodlands which will require replanting; and whether any steps are now being taken to provide for that shortage, in view of the delay in setting up that authority due to the need for special legislation?

Mr. Bonar Law: I am aware of the desirability of early legislation on the subject of forestry. The Interim Forest Authority are authorised to acquire seeds and to arrange for their planting, and they are taking active steps in this direction. Unfortunately, seed supplies are very short, as last autumn was extremely unfavourable both here and abroad for bringing seeds to maturity.

Major Lane-Fox: Can the right hon. Gentleman tell us when this legislation is likely to be introduced, in view of the urgency of the question?

Mr. Bonar Law: Yes; in the immediate future

Colonel Yate: Will steps be taken to establish a regular school of forestry in this country?

Mr. Bonar Law: Legislation on this subject is now being prepared, and I hope will be introduced in the immediate future. (28th February, 1919.)

Reconstruction of the Board of Agriculture.—*Lieut.-Col. Weigall* asked the Prime Minister whether, as a necessary preliminary to carrying out agricultural reconstruction and rural regeneration as outlined in his speeches on the 16th November, 1918, the 23rd November, 1918, and 7th December, 1918, it is proposed to reorganise the Board of Agriculture in order that it may have the status, staff, and accommodation necessary to effectively administer and control; and, in particular, whether the eleven separate offices now under the Department can be centralised in one building in the interests of efficiency and economy?

Sir A. Griffith-Boscawen: I have been asked to answer this question. The answer to the first part of the question is in the affirmative, and various proposals are being placed before the Treasury. The position as regards the Board's office accommodation is undoubtedly serious. There are 19 separate offices, not 11 as stated by the hon. Member. My Noble Friend has made representations to the Government on the subject.

OFFICIAL NOTICES AND CIRCULARS.

N.B.—The Orders which may be mentioned in this section of the JOURNAL may usually be obtained at the price of 1d. each from H.M. Stationery Office, Imperial House, Kingsway, London, W.C. 2, and 28, Abingdon Street, London, S.W. 1; 37, Peter Street, Manchester, and 1, St. Andrew's Crescent, Cardiff.

It was stated in an announcement made by the Joint Committee for the Board of Agriculture and the Ministry of Food on 26th February, that the Board of Agriculture and Fisheries have again had before them the question of the Cereals Prices for the 1919 Crop. prices to be paid to farmers for controlled cereals harvested in 1919. As the matter stands, the War Cabinet, on the 19th November last, have authorised

the statement that farmers would obtain for such cereals not less than the prices "now current." The Board are, however, not yet in a position to state precisely in what manner the promise given on behalf of the Government will be carried out, a matter which is under consideration at the present time.

AN Order (No. 161) dated 14th February, 1919, has been made by the Food Controller, amending the Grain (Prices) Order, 1918,* as follows:—

1. Clause 11 of the Principal Order shall be deleted and the following Clause shall be substituted therefor—

Order Amending the Grain Prices Order, 1918.

"11. (a) A person shall not sell or offer to sell any wheat, rye, oats or barley, whether imported or home grown, which has been torrefied or bleached, otherwise than by weight, or at prices exceeding the maximum prices, if any, applicable under the provisions of this Clause.

(b) Upon the occasion of a sale of any such wheat, rye, oats or barley the maximum price shall be ascertained—

(i.) In the case of wheat, rye, oats or barley harvested in the United Kingdom, by adding to the price applicable to wheat, rye, oats or barley under this Order the cost of such torrefying or bleaching not exceeding a usual and reasonable charge.

(ii.) In the case of damaged imported wheat, rye, oats or barley, by adding to the price applicable thereto according to the provisions of the Damaged Grain, Seeds and Pulse (Prices) Order, 1917, as amended† the cost of such torrefying or bleaching not exceeding a usual and reasonable charge."

THE following announcement was made by the Ministry of Food on 3rd March:—

Amended Prices for Peas, Beans, Maize and Oats. The Royal Commission on Wheat Supplies announce the following alterations in their selling prices, to take effect as from 17th March, 1919, for consumption in the United Kingdom only:—

	<i>Present Prices.</i>		<i>Future Prices.</i>	
Peas, blue and green	£66 15s.		£48 15s.	per ton, <i>ex</i> store.
Beans—				
Butter	£58 15s.		£40 15s.	" "
White haricot ..	£40 15s.		£20	" "
Coloured	£35		£20	" "
Maize—				
Argentine	£3 10s.		£3	per 480 lb. c.i.f.
American	£3 15s.		£3	" "
South African ..	£3 15s.		£3 5s.	" "
Maize Meal	£22 10s.		£20	per ton <i>ex</i> store.
Oats—				
Irish	£2 16s.		£2 10s.	per 320 lb. <i>ex</i> store.

* Printed in this *Journal*, September, 1918, p. 742.

† See this *Journal*, December, 1917, p. 1026, and June, 1918, p. 346.

THE following Press Notice was issued by the Ministry of Food on 5th March :—

**Order Prohibiting
Consignment of
Potatoes from Kent to
London.**

In view of the fact that the surplus of potatoes in Kent has now been absorbed, the Food Controller has revoked as from the 10th March, 1919, the general licence by which potatoes were allowed to be moved or consigned from the Kent (zonal) area to the London (postal) area. On and after that date no potatoes will be allowed to be moved from Kent to London, except where they are carted to London, and the distance from the farm to the place of delivery does not exceed five miles.

The movement and consignment of potatoes from the Kent area to the zonal area P.O. 8, comprising Surrey (outside London postal area) and Sussex, is however still permitted by general licence.

THE Food Controller has made an Order (No. 120), dated 7th February, 1919, ordering that on and from 10th February, 1919, the Cattle Feeding Stuffs (Maximum Prices) Order, 1918,* shall be amended as follows :—

**Order Amending the
Cattle Feeding Stuffs
(Maximum Prices)
Order, 1918.**

1. Sub-clause (iii.) of Clause 3 shall be deleted and the following Sub-clause shall be substituted :—

- (iii.) (a) Where on a sale of millers' offals such quantity is less than 1 cwt., but more than 28 lb., and the bulk is broken, a sum at the rate of $\frac{1}{4}$ d. per lb.
- (b) Where on a sale of millers' offals such quantity is 28 lb. or less, and the bulk is broken, a sum at the rate of $\frac{1}{4}$ d. per lb.
- (c) Where on a sale of any other cattle feeding stuffs such quantity is less than 1 cwt. and the bulk is broken, a sum at the rate of $\frac{1}{4}$ d. per lb.

2. Clause 6 of the Principal Order shall be deleted, and the following Clause shall be substituted :—

- (a) Except as provided with reference to millers' offals in paragraph (b) of this Clause, all cattle feeding stuffs for which a maximum price is prescribed by this Order, whether imported or made or produced in the British Islands, shall, if sold in sacks or bags, be sold gross weight, sacks or bags included, and in the case of cattle feeding stuffs made or produced in the British Islands such charges in respect of sacks or bags as the Food Controller may from time to time by notice prescribe may be added to the maximum prices prescribed by this Order. Until further notice, the prescribed charges in respect of sacks or bags shall be :—

- (i.) On a sale of cake or meal a charge at the rate of 15s. per ton if sold in 20 sacks or bags to the ton, and so in proportion according to the number of sacks or bags used per ton.

(ii.) On a sale of millers' offals a charge at the rate of 25s. per ton if sold in sacks or bags containing 1 cwt. or less and 20s. per ton if sold in sacks or bags containing more than 1 cwt.

(iii.) On a sale of any other cattle feeding stuffs a charge at the rate of 25s. per ton if sold in 20 sacks or bags to the ton, and so in proportion according to the number of sacks or bags used per ton.

Provided that in any of the foregoing cases the buyer may by arrangement with the seller send his own sacks or bags to be filled, in which event the cattle feeding stuffs shall be sold net weight, sacks or bags excluded, and in that event no charge shall be added under this Clause to the maximum price.

(b) (i.) On a sale of millers' offals produced in the British Islands, and sold in sacks or bags bearing a miller's name or trade mark, the seller may at his option, notwithstanding anything in paragraph (a) of this Clause, sell net weight, sacks or bags excluded, and make a charge at the rate of 2s. 6d. per sack or bag, in which event the charge shall be shown as a separate item on the invoice and be repaid on the return within three months of the date of invoice of any sack or bag which bears the same name or trade mark and is in good condition.

(ii.) On a sale of imported millers' offals sold in sacks or bags the seller may make a charge for such sacks or bags at the rate permitted by Sub-clause (a) (ii.) of this Clause.

4. In paragraph (b) of Clause 17 of the Principal Order the word "article" shall be deleted and the words "cattle feeding stuffs" shall be substituted.

THE following Press Notice was issued by the Ministry of Food on 27th February :—

Distribution of Cattle Feeding Stuffa. The supplies of cattle feeding stuffs that will be available for consumption before the end of the winter feeding season are estimated to be sufficient for the needs of live stock at the present rate of consumption, and the Food Controller accordingly does not propose, after 15th March, to issue any further certificates for oil cakes and meals. Dealers need not accept any certificates that have not been deposited with them before the 1st April, nor are they bound to fulfil any orders under certificates deposited with them before 1st April unless such orders have been given before 15th April.

Farmers and others may purchase supplies freely wherever they are available, but whenever supplies are not equal to all the demands purchasers requiring supplies for milch cows will be given a preference.

Supplies of linseed cake are temporarily not equal to the demands for that variety, and while makers will distribute them as equally as possible, farmers should, whenever necessary, use the other varieties that are purchaseable.

**Increased Prices
for Cattle.**

THE following tables on the sale of cattle,
replace those published on pp. 1025-7 of this
Journal for November, 1918:—

PRICES OF CATTLE PER CWT. LIVE WEIGHT.

(b) The increases given above do not apply to Grade B cattle.

THE following Notice was issued by the Food Production Department of the Board on 7th March :—

**Ammonium Nitrate
as a Fertiliser.**

The Board of Agriculture desire to draw the attention of farmers to the fact that large quantities of ammonium nitrate are now available. Hitherto, the disadvantage of this material for manurial purposes lay in the readiness with which it absorbed moisture from the air, sometimes setting into solid lumps which it was difficult to drill into the land. This difficulty has, however, been overcome, and the material now at disposal may be stored for a considerable period without absorbing moisture, and remains in good condition and quite suitable for drilling. Experiments recently made at Rothamsted show that ammonium nitrate is at least as useful as sulphate of ammonia for wheat and for mangolds. Its fertilising value per ton is nearly twice that of sulphate of ammonia ; consequently a smaller quantity is needed, and its use would result in a considerable saving in respect of carriage and handling. In view of the wet winter, it is probable that in the majority of cases wheat will benefit from a top-dressing of nitrogenous manure, and a dressing of about $\frac{1}{2}$ – $\frac{3}{4}$ cwt. per acre of ammonium nitrate might now be applied, mixed, if necessary, with about an equal weight of dry earth to facilitate distribution. Similarly for the production of hay it should be given a trial. The manure may, if desired, be mixed with dry superphosphate immediately before sowing. The Disposal Board is prepared to issue ammonium nitrate for manurial purposes at £25 per ton, f.o.r. store, packages free, and farmers desirous of purchasing should apply to the Secretary, Disposal Board (D.B. 4 C), Ministry of Munitions, Storey's Gate, S.W. 1. Farmers should state that the material is required for use as manure.

THE following Notice was issued by the Food Production Department of the Board on 7th March :—

Prices for Nicotine. Fruit growers and makers of insecticide washes should note that the manufacturers of nicotine have agreed that the maximum price to be charged for nicotine to the grower or manufacturer of compound washes up to the 30th June next is 16s. per lb., 95 to 98 per cent. purity for 100 lb. lots delivered to purchasers nearest railway station, and 16s. per lb. f.o.r. for sales of less than 100 lb. lots. Prices of nicotine for lower purity are to be proportionate. Buyers of nicotine are required to give an undertaking in writing, that any nicotine purchased by them will be used solely as an insecticide for their own crops, or else in the manufacture by them of compound washes for re-sale.

THE following Press Notice was issued by the Ministry of Food on 4th March :—

**Deputation on Milk
Control.**

This afternoon the Food Controller received a deputation from the National Federation of Dairymen's Associations, who desired to put before him their views on the future of milk control, especially as affecting distributors. The deputation was introduced by Mr. Reginald Butler of the United Dairies, President of the Federation, who pointed out that they were willing to assist the Food Controller in every possible way, but at the same time wished to have some assurance as to what was going to happen to the dairy trade.

After other speakers had been heard, Mr. Roberts replied to the deputation. He stated that so far no decision had been taken as to the permanent control of the trade, and that any such decision must necessarily be that of the Government and be arrived at after full consideration of all sides of the problem. He emphasised the fact that the quality of milk was a most important matter from the point of view of national welfare, and suggested that much might be done by the trade themselves to bring about an improvement in this respect.

Mr. Roberts promised that careful consideration should be given to a number of detailed points which had been raised by the speakers, in regard especially to the fixing of milk prices, the powers of Food Control Committees and the producer's price for cheese. The deputation expressed themselves as gratified with the sympathetic hearing which Mr. Roberts had given to them.

THE following Press Notice was issued by the Ministry of Food on 3rd March :—

Clean Milk.

The National Clean Milk Society have appointed as demonstrators Miss F. M. Westray and Miss C. R. Westray, who have been working as milkers and dairymaids for $3\frac{1}{2}$ years during the War on one of the few farms producing milk that is licensed by the Ministry of Food to sell its product as grade A milk.

Either of these demonstrators is now prepared to visit any farm whose occupier would like to have his employees shown how clean milk can be produced. The Society is anxious to demonstrate that whereas suitable buildings are of great help, clean milk can be produced by anyone who is really determined to produce it, even if the buildings are unsatisfactory, as proper methods are the most important factors. Particulars as to terms, etc., will be given upon application to Mr. J. B. Ferguson (Hon. Sec.), 2, Soho Square, London, W. 1.

THE following Circular Letter was addressed to County Councils and the Councils of County Boroughs in England and Wales by the Food Production Department of the Board on

Land Settlement. 26th February :—

SIR,—1. I am directed by the President of the Board of Agriculture and Fisheries to inform you that special inquiries have been made by a Commissioner of the Board with the object of ascertaining the character and extent of the probable demand for land settlement among the troops in France. The information obtained indicates that while a considerable number of men with previous agricultural experience desire to obtain small holdings of sufficient size to provide them with a livelihood there are a much larger number of men who would prefer to depend mainly on employment for wages, but who are anxious to obtain an untied cottage together with a small area of land exceeding 1 acre, which could be used partly for cultivation, partly for fruit growing, partly for keeping pigs and poultry, or, if the area permitted, a cow.

2. The Board think, therefore, that Councils should be prepared to establish a considerable number of these cottage holdings, and they are satisfied that their provision will not only meet the needs of the majority

of applicants, but that they will also be of great value to the nation as a whole, and to the agricultural community in particular. They will afford a valuable source of additional labour in agricultural districts; they will help to meet the serious shortage of rural cottages; and they will be the best means of enabling men without much previous experience or capital to begin in a small way with the least possible risk of failure. Such holdings will also be the best means of providing for partially disabled men who require an open-air life and who, with the help of their families, can supplement from the produce of their holdings their pensions and any wages they can earn.

3. The character of these cottage holdings will vary in different districts. In some counties they might be devoted mainly to dairying on a small scale by providing from one to two acres, with the cottage, for growing roots and fodder crops, together with a common cow pasture which might be managed by the Parish Council for a group of holdings. I am to enclose for your information a copy of a Letter and Memorandum* on this type of holding which is being sent by the Essex County Council to the Parish Councils in that county, and I am to suggest that similar action might be taken in your county if the conditions are suitable.

4. In districts where the land is suitable and facilities exist for marketing the produce, cottage holdings might be established mainly for growing fruit or market-garden crops, while the keeping of pigs and poultry should always be associated with such holdings.

5. Under the Small Holdings and Allotments Act, 1908, Councils have power to erect houses on holdings exceeding one acre, and there is no reason therefore why immediate steps should not be taken to acquire small areas of land throughout your county for the provision of cottage holdings, so that the erection of the necessary houses may be put in hand as soon as possible. The Board feel sure that many landowners will be glad to place land at the disposal of Councils for this purpose, and in this connection I am to suggest that special consideration should be given to the acquisition of glebe, which is often good land conveniently situated.

6. The provision of cottage holdings will be the best method of meeting the needs of men who prior to joining the Forces were employed in the large towns, but who desire to settle on the land. A considerable number of such men have acquired a taste for an open-air life, many of them were brought up in the country and some of them have gained experience from the cultivation of allotments in the urban areas. It is obviously desirable from the national point of view that such men should be encouraged to settle on the land, and the Board desire to commend specially to the Councils of County Boroughs the importance of dealing promptly with any demand of the kind from ex-service men belonging to the large boroughs. Under the Small Holdings and Allotments Act, 1908, the Councils of County Boroughs are empowered to provide holdings for their residents, and they have powers of acquiring land for the purpose either within or without the borough. The Board's District Commissioners will be glad to assist Councils of County Boroughs in the selection of suitable land, and in the equipment and adaptation of the holdings. The energies of County Councils will be fully occupied for some time to come in providing for the needs of their own applicants, and it will not be possible for them in most cases to accept applications from residents

* This Letter is not here printed, but the Memorandum is given below.

in County Boroughs, for whom they have no special responsibility. Lord Ernle is of opinion therefore, that the Councils of the County Boroughs should themselves undertake the responsibility of dealing with applications from their ex-service residents who desire to settle on the land.

7. With regard to the larger holdings of sufficient size to provide a livelihood for the holder and his family, the Board think that as a general rule, in order to secure the advantages of co-operation, they should be established in groups in the most suitable districts. If an applicant desires a self-supporting small holding equipped with house and buildings he should be prepared to move to any part of the county where holdings of the kind can be provided, and the Council should not feel bound to acquire any particular land specified by the applicant.

8. As a large number of applications for land are being received by Councils, I am directed to say that the Board attach great importance to the applicants being interviewed as soon as possible. In the case of men who are in this country the best method is to arrange for small sub-committees to interview the men promptly at different centres as near as possible to their homes, so that local information can be obtained as to their capabilities and qualifications. With regard to men who are still serving in the Forces abroad, their applications should be acknowledged and they should be asked to give the Council notice of when they expect to return home either on leave or permanently, so that an interview may be arranged. It will obviate difficulties and disappointment if the men feel that their applications are dealt with promptly and sympathetically, while in the case of men who have not sufficient experience to be accepted as approved applicants for small holdings it is obviously desirable that they should be told so at once, so that they may lose no time in seeking some other occupation.

9. In the selection of approved applicants the Board think that so far as men who ask for self-supporting small holdings are concerned, Councils should set a high standard. It would be mistaken kindness to the men themselves as well as detrimental to the interests of food production to accept as tenants any men who have not sufficient practical experience and the necessary personal capacity to become successful small holders. They should also have some capital of their own, but in this connection I am to say that it is proposed in the Land Settlement Bill, which will shortly be introduced, to empower County Councils to advance loans to their ex-service tenants who have not sufficient capital of their own to assist them in the purchase of live stock, implements, seeds and fertilisers.

10. With regard to the training of men who desire to settle on the land, but who have little or no practical experience, I am to say that a further communication will be sent to you shortly explaining the Board's plans, but in the meantime I am to say that any training schemes which are established by the Government will be designed to give to unskilled men such practical experience as will enable them to obtain employment on the land as wage earners. The Board do not think it is practicable to attempt to provide courses of training that would fit an unskilled man to become a small holder on his own account, and they think that such men should, in the first instance, seek employment on the land as wage earners. In view of the casualties among the agricultural labourers who joined the Forces, and the increased area of land under the plough, there should be many openings for additional

labour on the land, and the rates of wages now current have rendered such employment far more attractive than it was before the War.

11. The Board have been glad to observe that so many Councils are taking active steps to acquire land for settlement, and they have information of a considerable area which has already been acquired, or is the subject of negotiations. In most cases, however, vacant possession will not be obtained in the ordinary course before Michaelmas, 1920, and Lord Ernle desires me, therefore, to urge upon your Council the supreme importance of endeavouring to acquire land which will be available for settlement at an earlier date. In the case of small areas for the establishment of cottage holdings it should be possible in many cases to arrange with the owners and occupiers for early possession so that no time may be lost in erecting the cottages.

12. It has been decided that the loans for the purchase and equipment of land for settlement shall be issued by the Public Works Loan Board under the same procedure as was in force before the War. Councils who have purchased land with the approval of the Board should, therefore, apply to the Local Government Board for sanction to borrow and then to the Public Works Loan Board for the loan, unless they are able to borrow on better terms in the open market.

I am, etc.,

(Signed) A. D. HALL,
Secretary.

ENCLOSURE.

Note on Land Settlement, prepared by the Essex County Council.

THE County Council believe that a number of ex-service men who wish to settle on the land in or near their own villages will be anxious to rent an untied cottage with an acre or two of land attached, but will prefer to work for wages rather than depend entirely on the production of their holdings.

It is suggested that in order to meet this expected demand a sufficient number of cottages should be built in each village and that each should have from $1\frac{1}{2}$ to 2 acres of land attached. A cowshed and pigstye should also be provided.

Each intending small holder should have a certain amount of capital—£25 to £40—and, under a system of credit, it is hoped that a similar amount might be advanced to him to supplement this capital. The money should be spent in the purchase of a cow, a pig, seeds, manure, etc. It is essential that the cow should be insured.

The land should chiefly be devoted to growing winter feed for the cow. A common pasturage should in addition be provided at a fixed rent for grazing the cow during seven or eight months of the year. This pasture would be provided by the County Council and might be managed by the Parish Council or some other local body who would receive the rent and superintend the upkeep of the land—draining, fencing, cutting thistles and, when necessary, manuring.

* The occupier of the holding would work for wages and in his spare time cultivate his plot of land. It is important that horse cultivation should also be obtainable at reasonable times, and this could be arranged for by a system of co-operation possibly extending over several parishes.

The care of the cow and pigs would devolve upon the small holder's wife or family, who would in this way become associated with the successful working of the holding.

The County Council believe that the provision of holdings of this size, which will enable the occupier to work at the same time for a wage, will give many ex-service men an opportunity of acquiring a knowledge of farming and a love of country life without the anxiety and strain that would fall upon a possibly inexperienced man who attempted to make a living from a holding alope. If successful on this small holding they will later on be able more confidently to take a larger one.

The keeping of cows will at the same time provide a much needed supply of milk in country districts and will thus benefit the inhabitants as well as provide a source of income to the small holder.

THE following Circular Letter was addressed to the London County Council and to the Councils of Boroughs and Urban Districts in England and Wales by the Food Production Department of the Board on 21st February :—

War Allotments.

SIR,—1. The Board of Agriculture and Fisheries desire to call attention to the position which will arise at the termination of the War when D.O.R. Regulation 21 ceases to operate.

2. The Board's right of occupation under that Regulation will then cease, and their continuance in occupation will be under the Defence of the Realm (Acquisition of Land) Act, 1916. The Board will be able under that Act "for the purposes of the public service" to exercise in relation to land entered on under Regulation 21 all the powers conferred by that Regulation, but the terms and conditions of their occupation, including rent, will, failing agreement, be in practice determined by a single arbitrator agreed by the parties.

3. In determination of the rent the considerations of Paragraph 6 of the Schedule to the above-mentioned Act are to apply. That paragraph is as follows :—

" 6. In determining the amount of compensation, the value of the land acquired shall be taken to be the value which the land would have had at the date of the notice to treat if it had remained in the condition in which it was at the commencement of the present War, without regard to any enhancement or depreciation in the value which may be attributable directly or indirectly to any buildings, works, or improvements, erected, constructed, or made on, over or under the land, or any adjoining or neighbouring land for purposes connected with the present War wholly or partly at the expense of the State, or, with the consent of the occupying Department, at the expense of any person not being a person interested in the land :

Provided that :—

(a) where any such building, work or improvement was erected, constructed, or made in pursuance of an agreement with any person interested in the land, the consideration given by such person shall be taken into account in assessing the compensation payable in respect of such interest :

(b) where by virtue of an agreement with any Government Department any person interested in the land is entitled as between himself and that Department to the benefit of any such building,

work, or improvement, the value attributable to such building, work, or improvement shall be taken into account in assessing the compensation payable in respect of such interest ;

(c) where, since the commencement of the present war, any person interested in the land has himself erected, constructed, or made any building, work, or improvement, or has contributed to the expense thereof, or has committed any act depreciating the value of the land, the value attributable to his expenditure or the depreciation in value attributable to such act shall be taken into account in assessing the compensation payable in respect of such interest."

4. There will not in these cases be any "notice to treat," but it will be desirable, if not essential, that the owner and tenant (if any) of the land, should receive notice of the intention of the Board to continue in occupation of the land until further notice. The Board cannot well indicate more fully the period of their occupation until they know the rent and other conditions that will attach to the occupation, as these, and in particular the rent, may in some cases make continued possession so expensive that it would be undesirable.

5. This notice should be given soon, and be accompanied by an offer to negotiate the rent and conditions of occupation, and a form of notice is attached.*

6. The negotiation as to the rent and conditions must naturally aim at arriving at the probable rent and conditions that an arbitrator would award.

7. The rent offered should, as a general rule, be the post-war annual value of the land in the condition in which it was at the time of entry by the Board. As regards tenure, it would be well to provide for a continuance of possession until the expiration of two years from the termination of the War, and if the Board obtain the Railway and Canal Commissioners' consent to their further continuance of possession, then until the expiration of the period allowed by the Commissioners ; but possession should be determinable—

(a) by the Board at Lady Day or Michaelmas by three months' notice ; and

(b) by the landlord at any time if the land is reasonably required for building or industrial purposes.

8. The Board will, in proper cases, have to agree to restore the land, if so required by the landlord, to the condition in which it was at the time of entry by the Board or at their option to pay compensation for its not being so restored. This will be subject to any arrangements already made for payment of compensation.

9. The Board would reserve the right to remove all fences and erections on the land.

10. Where possible the Council should at the same time arrive at a provisional settlement of the claim for compensation under Regulation 2L, for the occupation by the Board up to the termination of the War.

11. The powers of the Act of 1916 are conferred on the Board as the "occupying department," but while the Board remain in occupation under the Act, they will be able to exercise the power now conferred on them by Paragraph (5) of Regulation 2L, and to authorise your Council to act on their behalf in arranging for the cultivation of the land. This

* Not here printed.

power the Board will exercise when the time arrives, and in the meantime your Council is requested to negotiate the terms and conditions of the Board's continuance of possession *subject in every case to the approval of the Board.*

12. In many cases the Council will find it possible to arrange for acquiring the land on lease for allotments under the Small Holdings and Allotments Act, 1908, and for putting an end to the temporary occupation under Regulation 2L, and wherever this course is possible, it should be adopted.

I am, etc.,
(Signed) F. L. C. FLOUD,
Assistant Secretary.

THE following Circular Letter was addressed to Clerks of County Councils and County Borough Councils in England and Wales by the Board on 25th February :—

Destruction of Rats. SIR,—I am directed by the President of the Board of Agriculture and Fisheries to say that many Local Authorities still fail fully to realise the responsibility vested in them under the Rats Order, 1918,* and the importance of their initiating measures to reduce the damage to property and foodstuffs which is being caused by rats. As the period between now and the end of March is the most favourable in which to wage war against this national enemy, it is most important that effort should be made in every locality, by all concerned, to reduce the number of rats as much as possible within the next month. As has already been pointed out in the Board's Circular Letter of 20th January,† co-operation and co-ordination by all concerned are essential if any measure of success is to be attained; and laxity, even in districts where rats are believed to be few, is bound to counteract energetic action on the part of those who fulfil their duties under the Order. Rats are migratory animals and will naturally seek quarters, and increase, where they are allowed to remain, undisturbed. On these grounds alone lack of systematic measures and persistent efforts in any district will obviously prove an expensive policy in the long run.

For the guidance of those Local Authorities who have not yet formulated any definite scheme under the Order, I am directed by Lord Ernle to forward the enclosed notes,‡ and to express the hope that they may be considered at the earliest possible date. Whilst any and every proved and suitable means for compassing the destruction of the rat is to be encouraged, it is necessary, in order to secure the best results, that the measures taken should be controlled and co-ordinated by persons with a knowledge of the subject and capable of organising a campaign on broad and sound lines. It should be borne in mind that in addition to the vast amount of damage to food and property caused by rats, very considerable sums of money are expended by owners in every district in spasmodic and frequently fruitless efforts to clear their premises. Such persons would willingly pay for the services of trained men to clear their premises, and any owner of infested premises who demurs or refuses to take the steps considered necessary by the officer of the Local Authority should have notice served upon him, and

* Printed in this *Journal*, September, 1918, p. 761.

† See below.

February, 1919, p. 1380.

action should be taken under Article 2 of the Order. There should be no difficulty therefore in the expenses incurred by the Local Authority being recovered from the individuals who would directly benefit.

The Board understand that in many districts the efforts of Local Authorities and others in connection with the Rats Order, 1918, have been hampered by reason of inability on the part of those concerned to procure the necessary poison. In the event of your Local Authority experiencing difficulty in obtaining a suitable rat destructive preparation where it is required in large quantities, Messrs. Haller & Co., of 52, Leadenhall Street, London, E.C. 3, who supply an inexpensive preparation for the purpose, might be referred to. This preparation, if carefully used, is said to be non-injurious to human beings and domestic animals, including poultry.

In this connection the enclosed copy* of an extract from a letter received by the Board from Messrs. Haller & Co., is sent for your information.

Where a preparation with the above properties is required in small quantity, a *Scilla maritima* (known as Squills) recipe, which is embodied in the enclosed notes, might be recommended. Care, however, should be used during preparation as the *Scilla maritima* acts as an irritant on the skin.

In cases where poison can be safely used such firms as

Mr. G. W. Harrison, Chemist, Reading ;
Messrs. Sandford & Sons, Sandy, Bedfordshire ;
Extirmo, Ltd., School Street Works, Hull ;
The Zeba Co., 66, Seel Street, Liverpool ; or
Mr. Harley, Chemist, Perth (" Rodine ") ;

might be referred to. It must be understood, however, that the Board do not guarantee or recommend any particular proprietary poison.

I am, etc.,

(Signed) A. D. HALL,

Secretary.

ENCLOSURES.

NOTES ON THE DESTRUCTION OF RATS.

1. **Suggestions for the Assistance of Local Authorities.**—Appoint an official as Executive Officer to the Local Authority. An ex-naval or military officer with a knowledge of the subject, and accustomed to routine work and a good organiser would be a suitable person. If advertisement for such an officer is unsuccessful application should be made to the Ministry of Labour, Queen Anne's Chambers, Westminster, S.W. 1. On such an appointment being made the name and address of the officer should be forwarded to the Secretary, Board of Agriculture and Fisheries, 4, Whitehall Place, London, S.W. 1.

Duties of Rat Officer.—(1) To inspect the area entrusted to his charge and collect and tabulate all information concerning rats therein (Card Index).

• (2) To get into touch with all farmers' associations, clubs and other bodies of a similar character who would be likely to assist him in carrying out his work, and to organise such associations, clubs, etc., if thought

* See below.

advisable, into parish, district and county associations which would be of a voluntary character.

(3) To engage assistants to lay baits and to do all work necessary to destroy rats and to supervise these assistants. As such men would be entrusted with "poison" they must be sober and trustworthy. Ex-service men of good character who have had previous experience in rat destruction as under-gamekeepers or otherwise should prove especially suitable.

The Board will at any time be glad for Mr. E. C. Read, who has had 25 years' experience on the Continent in dealing with the rat menace, and has recently been appointed Technical Adviser to the Department in connection with rat destruction, to give Local Authorities or their officers any advice they may require.

It must be understood that any measures to be effective should be of a permanent nature, and the assistants should visit all infested areas at regular intervals of, say, 8 to 12 weeks.

2. Measures Recommended for Prevention of Invasion and Destruction of Rats.—(1) *Ports*.—To prevent entry of foreign rats into the country, all incoming vessels should be fumigated or otherwise dealt with by competent persons. Sulphur dioxide (SO_2) applied through a suitable appliance (e.g., Clayton gas apparatus) is recommended for this purpose. Care should be taken to prevent vessels from again becoming infested before clearance.

(2) *Urban Districts*.—All premises on which presence of rats is suspected should be inspected. Drains to receive special attention. Infested premises to be made as rat-proof as possible; drains and connections between premises and sewers to be properly trapped and in good repair. It is estimated that in 75 per cent. of the cases of rat invasion of shops and dwelling houses in urban districts the invasion is due to defective drains. Refuse and garbage should be removed or placed in rat-proof receptacles and attention paid to proper storage of comestibles, etc.

Rat poisons non-injurious to human beings and domestic animals, such as *Scilla maritima* (Squills) and bismuth, or the lesser poisons, as BaCO_3 (barium carbonate), and traps can then be used to great advantage. Barium carbonate is a very good and probably one of the safest poisons. It has the merit of being tasteless and odourless when conveyed in a proper medium. This poison has been largely used by the authorities for the destruction of rats in the plague areas of India.

A well-known continental way of destroying rodents is to bake a pancake—egg pancake not essential, but beef dripping advisable—to which 20 per cent. of finely-chopped *Scilla maritima* (Squills) red variety is added, either to the batter before frying, which is simpler, or placed between two layers of pancake after frying. When cold the pancake should be cut in pieces of about $\frac{1}{2}$ in. square and laid in the rat runs or holes.

Rats are particularly susceptible to the effects of *Scilla* (Squills).

If *Scilla* in a bulbous form is not obtainable a solution of squills is manufactured by, amongst others, Haller & Co., 52, Leadenhall Street, E.C. 3, who can give information as to its application in the liquid state.

(3) *Rural Districts*.—In places where there is no danger to human beings, domestic animals, poultry, or foodstuffs, other poisons may be usefully employed; these should be judiciously laid by trained men.

Trapping, ferrets, and, under favourable conditions, viruses can all be made use of according to the conditions of the area involved.

Carbon-bisulphide (CS_2) is often applicable on allotments and small holdings. Pieces of wadding or cotton waste are soaked in the liquid to saturation point, placed well in the rat holes and the hole immediately covered in. *On account of the highly volatile nature of CS_2 , no light or smoking should be allowed during its application.* It is of paramount importance to see that rural buildings, farmyards, granaries, etc., etc., do not harbour garbage, and that all foodstuffs are properly protected from rats.

The building of stacks on staddles should be encouraged. Before threshing commences the stacks should be surrounded with fine-meshed wire, not less than 4 ft. in height and at sufficient distance from the stack to prevent rats clearing it from the stack.

The cost of the destruction of rats should be borne by the owner or occupier of the premises on which the operations are carried out. In dealing with an infested area the attack should be commenced on the boundaries of the area and gradually close in towards the centre.

EXTRACT FROM A LETTER RECEIVED BY THE BOARD FROM
MESSRS. HALLER & CO., DATED 11TH FEBRUARY.

SIR,—Agreeably with the invitation of the Board conveyed by a visit of Mr. Ernest C. Read on the 23rd ult., we beg to state that we can supply liquid Extract of Squills, the same as manufactured at the Pasteur Institute, Paris, under the direction of Dr. Danysz, and as used during the War in the trenches and on formations in France, in the case of large quantities being required, say not less than 500 to 1,000 gal. at a time, at 3s. per gal., *ex* our laboratory in London, packages to be charged extra, which, however, may be returnable.

This Extract would be of such a standard, that on an average one cubic centimetre, made into bait with from 5 to 7 gram. of suitable matter (milk or broth, stale bread, rolled oats, dry brewers' grain, etc.) would constitute a mortal dose to the average rat of a given locality. We have established this standard to our own satisfaction by a series of tests and experiments carried out at the laboratory and under the supervision of Professor Hewlett of London University, and his reports are at the service of the Board. But probably it would be advisable that a common standard as between the local authorities disposed to give us an order and ourselves as sellers should be established.

The Extract could be sent out in wooden barrels or in iron drums, and in these closed packages would remain in perfect condition for a week or more. Details of making the bait need not here be described, but the most suitable materials and their respective quantities would be as follows :—

- To 1 gal. of extract,
- 2 gal. of fresh milk or broth,
- 1 lb. sugar,
- 30 lb. of bread or rolled oats (without husks) dry brewers' grain,
- etc., making together say 60 lb. of bait.

One gal. of Extract containing, say, 4,500 mortal doses (1 gal. = 4,540 cc.) and consequently, 60 lb. of bait made therewith, 1 lb. of this bait would contain 75 doses, equal to $4\frac{1}{2}$ doses per oz., thus making say, $\frac{1}{2}$ oz. of bait a mortal dose.

We should like to submit, if only *pro forma*, a calculation as to the probable cost of the bait :—

	s.	d.
1 gal. of extract	3	0
2 gal. of milk	3	9
1 lb. sugar	0	6
30 lb. bread or oats at 2½d.	6	3
Incidentals	1	6

Say 15s. for 60 lb. of bait,

equal to 3d. per lb. Possibly under present conditions the cost may be slightly higher, but even then, it should not exceed 4d. per lb.

Assuming the latter figure as being correct, it would even then represent a potential capacity of killing 75 rats at that expenditure.

As in connection with very large applications of Squills bait, the use of milk would, under present conditions, form a serious obstacle, we could supply a suitable broth, which is readily eaten by rats, to be used instead of milk at a cost of 1s. 9d. per gal., *ex* laboratory, packages extra.

IN the district scheduled in connection with the outbreak of Foot-and-Mouth Disease, confirmed on 9th January at Littlethorpe, near Ripon, 16 outbreaks in all have been confirmed.

Foot-and-Mouth Disease. On 24th February an outbreak was confirmed at Stanningley (Leeds), the usual restrictions on the movement of animals being imposed. There is evidence suggestive of this outbreak being attributable to those in the Ripon area. Owing to the district being so thickly populated special provision was made for the movement into the area of fat stock for immediate slaughter so as to ensure the meat supply. Two outbreaks have been confirmed in Huddersfield.

OUTBREAKS of Rabies were confirmed near Newport (Mon.) and at Cardiff on 13th and 14th March respectively. Orders have been issued controlling movement of dogs out of an area comprising Monmouth, part of Glamorgan, and a small part of Brecon, and requiring the muzzling of dogs in the areas.

The total number of cases of Rabies which have been confirmed to date since the present series of cases commenced in September last now stands at 127. Of these 97 were in Devonshire and 25 in Cornwall. There are also 16 cases still under investigation, one in Monmouth and one in Glamorgan. The period of quarantine on approved veterinary premises, required for all dogs moved out of those counties to other parts of Great Britain, is six calendar months.

IN a letter addressed to the Press, on 8th February, the Joint Committee of the Board and the Ministry of Food state that in July last the Committee directed attention to the prevalence of Parasitic Mange in Horses, and the likelihood of its spreading in the coming months, and also to the issue by the Joint

Parasitic Mange in Horses. Committee of a Special Leaflet (No. 8)* in which particulars were given :—

* See this *Journal*, August, 1918, p. 581.

- (a) As to the Orders in existence in regard to the disease.
- (b) The penalties attached to breaches of the Orders.
- (c) Means whereby the disease can be prevented, discovered and treated.

Since the issue of this Leaflet (No. 8) two additional Leaflets on the same subject have been published* by the Committee, and have had a very wide circulation.

The letter adds that the Committee are informed that the Local Authorities view with growing anxiety the increasing prevalence of mange in horses reported in the returns furnished by them. Further, there are grounds for believing that the disease exists in many districts to a much greater extent than is revealed in the returns furnished. The Committee point out the serious effect the disease has in decreasing the usefulness of the horse.

THE Board of Agriculture and Fisheries, by virtue and in exercise of the powers vested in them under the Diseases of Animals Acts, 1894 to 1914, and of every other power enabling

**Importation of Dogs
(Amendment)**

Order, 1918 (No. 2).

1. The period of detention and isolation prescribed by the Importation of Dogs Order of 1914 (hereinafter referred to as "the principal Order") is hereby increased to six calendar months, and the principal Order shall be read and have effect as if "six calendar months" were substituted for "four calendar months."

2. In the case of a dog landed after 30th November, 1918, under the authority of a licence granted under the principal Order, the licence shall have effect as if "six calendar months" were therein inserted instead of "four calendar months."

3. The Importation of Dogs (Amendment) Order of 1918 is hereby revoked.

4. This Order may be cited as the Importation of Dogs (Amendment) Order of 1918 (No. 2), and shall be read with the principal Order.

THE Governors of the Agricultural Organisation Society have decided to undertake forthwith an active and systematic campaign throughout the country for the following purposes:—

**Agricultural
Organisation:
Propaganda Campaign
by the Agricultural
Organisation Society.**

(a) To explain to the agricultural community the advantages of combination and co-operation on the part of the farmer.

(b) To strengthen existing Farmers' Co-operative Societies and to aid the establishment of new societies.

(c) To secure the adhesion of 150,000 additional farmers to the movement.

The Agricultural Organisation Society consider that the transition from war to peace conditions, with all the difficulties that agriculture

* See this *Journal*, November, 1918, pp. 971 and 976.

will have to face in the future, offer a splendid opportunity to impress upon farmers the great lessons of co-operation in agriculture for business purposes on business lines.

At the present time over 50,000 English and Welsh farmers are members of co-operative farmers' societies, and hundreds are joining every day. To those farmers who are not members of a co-operative society it becomes a serious problem how they are to face the future under a system which often compels them to buy their requirements—the raw materials of their industry—at retail prices and sell their produce at wholesale prices in markets over which, without organisation on co-operative lines, they can exercise no control.

Co-operation will go a long way to solve these difficulties, and the best agricultural opinion is that the farming industry—the greatest industry in the land—must be reorganised and put on a better business footing in the same way as the manufacturing industries of the country.

The leaders of the campaign, the Earl of Selborne, K.G., Mr. Leslie Scott, K.C., M.P., and Major E. A. Belcher, C.B.E., the Society's new Director of Propaganda, with their supporters, will tell the farmers at meetings, which are being arranged in succession for every market town in the country, how the objects of the Society can be achieved and what results have already been obtained by the numerous successful societies that have been promoted and fostered by the Agricultural Organisation Society.

THE Food Controller announced on 3rd March that his attention has been drawn to contracts which have been and are being made between jam manufacturers, fruit dealers, and fruit growers for various kinds of fruit to be delivered during the coming season at prices greatly in excess of those obtaining last season.

**Fruit for
Jam Making.**

The Food Controller wishes it to be clearly understood that, should evidence continue to accumulate that fruit prices are likely to reach unreasonable limits during the approaching season through speculation at this juncture, he will consider it his duty to re-impose the control exercised during the past two seasons.

THE following further Instruction (Army Council Instruction No. 139 of 1919, dated 25th February, 1919), has been issued by the War Office regarding the rates of pay due

Payment of Prisoners of War Employed on Agriculture.

from employers of prisoners of war engaged on agriculture. Farmers and other employers of prisoners of war must pay the full local rates in all cases for prisoner of war labour. No exceptions can be made to this rule.

Where the farmer is responsible for the guarding of prisoners of war during the hours of work, an abatement of 4d. per day per prisoner of war may be allowed.

Where prisoners of war are fetched over one mile by the farmer, or by soldiers of agricultural companies in the employ of the farmer, an additional abatement of 4d. a day may be allowed.

Attention is called to para. 39 of A.C.I. 1324 of 1918* providing that prisoners of war shall put in the full number of working hours on the farms. In cases where the prisoners of war do not put in the full number of working hours customary in the locality (allowing for meal-times) a proportionate amount for the number of hours actually put in will be charged. When, however, the failure to put in full time is due to the failure of the farmer to fetch the men in time, a full charge will be made. The rate for overtime is to be full local rate for overtime work.

**Revocation of Statutory
Rules and Orders
affecting Farmers.**

THE following Orders have recently been
revoked by the Food Controller :—

No. of Order.	Title of Order.	Page of <i>Journal</i> in which Order was Published.
No. 821 of 1917	Barley (Restriction) Order, 1917	September, 1917, p. 683.
No. 1029 of 1918	Cereals (Restriction) Order, 1917.	September, 1918,† p. 745.†
No. 1082 of 1918	Vegetable Marrow Order, 1918.	October, 1918, p. 882.
No. 1331 of 1918	Horses (Rationing) Order, No. 2, 1918.	November, 1918, p. 1015.
No. 444 of 1917	Dealings in Oats (Restriction Order, 1917.	June, 1917, p. 364.

IN the issue of the *Wages Board Gazette* for 18th February, 1919, it is stated that the Wages Board have made an Order further defining as overtime employment all employment in excess of 6½ hours on a Saturday or on such other day (not being Sunday) as may be agreed between the employer and the worker. The Order, which came into operation on the 3rd March, is based substantially on the Board's proposal of 10th January, but a modification has been introduced which affects the position of special classes of workers whose weekly wages are based on "customary" hours. In the case of these workers, the time spent by them in connection with the feeding and cleaning of stock will not rank as overtime employment, notwithstanding that the performance of these duties has the effect of bringing the time worked by them on the short day to more than 6½ hours.

The effect of the new Order and of the Orders fixing minimum rates of wages already in force may be illustrated by reference to the cases of (1) an ordinary labourer to whom the minimum rate applicable is 30s. for 54 hours, with overtime rates for all hours in excess of 54 in any week; and (2) a horseman to whom the minimum rate applicable is 36s. for a week of "customary" hours, with overtime rates to apply only after "customary" hours are exceeded.

* Not printed in this *Journal*.

† See also this *Journal*, January, 1919, p. 1237.

In the first case it will be possible, when a half-holiday is not at present given, to provide for the granting of a half-holiday and yet for the 54 hours to be worked for the 30s. By increasing the daily hours on each of the five days from 9 to $9\frac{1}{2}$, so that only $6\frac{1}{2}$ are worked on the sixth day, the total number of hours worked will be 54, but none of the time will rank as overtime, and the weekly wage payable will be 30s.

In the second case, the horseman will only be required, in order to be entitled to the full 36s., to work, in addition to the customary hours on five days, $6\frac{1}{2}$ hours on the sixth day, *plus the time necessary on that day to feed and clean his horses*. If the worker is required to put in a full day on the sixth day, he will be entitled to be paid at the overtime rates for all hours in excess of $6\frac{1}{2}$ on that day, except such as are spent in connection with feeding and cleaning his horses. On the other hand, if the worker does not put in $6\frac{1}{2}$ hours on the sixth day over and above the time necessary to feed and clean his horses on that day, he will not be able to claim the full 36s. for his week's work, but only a proportionate part of it.

In the case of counties where there are no special rates for stockmen, but these workers are paid on the basis of the minimum and overtime rates for ordinary labourers, e.g., 30s. for 54 hours, with overtime for all time worked in excess of 54 hours in any week, overtime would still be payable for all time worked in excess of 54 hours in any week, notwithstanding that the excess over the 54 hours was spent exclusively in connection with the feeding and cleaning of the stock. The provision in the existing Orders requiring overtime to be paid for all time worked in excess of 54 hours is not affected by the new Order.

Another point which is the subject of inquiries is the payment of "walking time" which is dealt with in the issue of the *Gazette* for 1st February.

The position with regard to this matter appears to be as follows: In the absence of any special provision in the contract of service or of any well established custom of the farm, the time spent by the worker in proceeding from his cottage to his place of work would not be reckoned as employment for the purpose of calculating the wages payable to the worker at not less than the minimum rates. By "place of work" is here meant the actual place where the work is carried on, but if a man's duties require him to go and return to the farm-house before or after his work in the fields (e.g., for the fetching or taking back horses or tools) the time occupied in walking between the two places would rank in his working hours. But if his duties are such that he can go straight from his home to the place of work in the fields and back in the same way, the walking time would not be so reckoned, unless his contract or the custom of the farm provide that he should be paid for that time.

The custom of the locality or of the particular farm is of importance in this connection. If it can be proved that it is the custom that the walking time should be paid for as work time, and if the worker has not agreed with his employer that such custom shall be excluded in his case, the worker would be entitled to be paid for the walking time. The burden of proving the custom would lie on the worker: if it were proved, the custom must be read into the contract of service unless it is expressly excluded. The matter is, however, one which is governed by the custom as incorporated in the contract of service, and not by the Corn Production Act or the Orders of the Wages Board.

In the Report of the Government Chemist upon the work of the Government Laboratory for the year ended 31st March, 1918, it is stated that the number of samples examined for the **Report of the Work of the Government Laboratory, 1917-18.** Board of Agriculture and Fisheries, the Board of Agriculture for Scotland, and the Department of Agriculture and Technical Instruction for Ireland, was 1,568 (exclusive of salinities) as compared with 2,075 in the previous year.

Sheep Dips.—Fourteen samples of sheep dips were received for examination in connection with applications by manufacturers for inclusion of their preparations in the official "Schedule of efficient dips." Before the Board of Agriculture give their approval to any dip they must be satisfied that the formula provides for a sufficient quantity of a recognised active ingredient, and that the dip has been made in accordance with the formula. In ten cases the samples were found to agree with the formulæ, and were of effective strength at the proposed dilution; one was deficient in active ingredients at the dilution submitted by the makers; in the remaining three cases the formulæ required modification to ensure an efficient dip. Thirteen samples of approved dips, purchased in different parts of the country, were also examined with the object of ascertaining whether the dips as sold corresponded in composition with the samples which had received the Board's approval. The analyses showed that four of these had not been prepared according to the formulæ previously submitted and approved.

The miscellaneous samples examined for the Board of Agriculture and Fisheries included samples for the Food Production Department; waste materials as to their value as fertilisers, milling by-products; basic slag and slags from waste tip-heaps as to their value.

Questions submitted by the Board for Report.—It is stated in the Report that in the course of the year numerous matters were submitted by the Board for report. Many of these related to the value of materials supplied as feeding stuffs, and to the supply of potash and phosphatic manures.

Sale of Food and Drugs Acts.—The following are the particulars of two important cases as to butter and milk examined under the Sale of Food and Drugs Acts :—

Butter.—One sample contained excess water; but the evidence as to the presence of foreign fat in the other case was not conclusive.

Milk.—In the 75 cases in which certificates were issued the charges were as follows :—In 42 cases, added water; 25, abstraction of fat; 6, added water and abstraction of fat; and 2, presence of dirt. Boric acid and artificial colouring matter were also alleged to be present in two of the samples.

Fertilisers and Feeding Stuffs Act.—The samples under this Act were submitted by the Board of Agriculture and Fisheries in connection with applications by local authorities for the consent of the Board to proceedings against the sellers.

The number of samples received was 20, consisting of 8 fertilisers and 12 feeding stuffs, against 26 in the previous year.

The fertilisers consisted of phosphate, guano, shoddy and special manures.

The feeding stuffs examined consisted of feeding meals and cakes, milling by-products and poultry foods. Several of the meals contained a considerable proportion of substances unsuitable for feeding purposes.

NOTICES OF BOOKS.

National Year-book of Agricultural Legislation, 1917.—The International Agricultural Institute has just issued its seventh International Year-book of Agricultural Legislation. The volume contains some 1,500 pages written in French with a 74-page introduction in English, in which the general course of the legislation of the World in 1917 in connection with agriculture is outlined, principally as affected by the conditions created by the War.

The body of this volume is divided into 11 sections giving account of the legislation in all the principal agricultural countries in the world affecting (1) agricultural and commercial statistics, (2) trade in agricultural products, machinery, manures and live stock, (3) finance and customs in relation to agriculture, (4) crops and vegetable products industries, (5) live stock breeding and animal products industry, (6) agricultural organisation and education, (7) plant diseases, weeds and plant pests, (8) agricultural co-operation, insurance and credit, (9) rural property and closer settlement, (10) relation between capital and labour in agriculture, and (11) rural hygiene and rural police.

There are two good indexes (in French), to the volume, arranged according to (1) country, (2) subject.

The price of the volume is 8s., or 2 dollars. Remittances should be forwarded to the Secretary, Board of Agriculture and Fisheries, 3, St. James's Square, London, S.W. 1.

MISCELLANEOUS NOTES.

THE International Crop Report and Agricultural Statistics for February, 1919, published by the International Institute of Agriculture, gives

Notes on Crop Prospects and Live Stock Abroad.

particulars concerning the production of the cereal crops of 1918 in certain countries in the Northern Hemisphere. *Wheat*.—The production in Denmark, Spain, United Kingdom, Italy, Luxemburg, Norway, Netherlands, Sweden, Switzerland, Canada, United States, British India, Japan, Egypt, and Tunis is estimated at 251,647,000 qr. in 1918, against 210,798,000 qr. in 1917, or an increase of 19.4 per cent. *Rye*.—The estimated production in Denmark, Spain, Ireland, Italy, Luxemburg, Norway, Netherlands, Sweden, Switzerland, Canada, and United States is placed at 21,102,000 qr. in 1918, or an increase of 34.6 per cent. compared with 1917, when it amounted to 15,680,000 qr. *Barley*.—The production in Denmark, Spain, United Kingdom, Italy, Luxemburg, Norway, Netherlands, Sweden, Switzerland, Canada, United States, Japan, Egypt, and Tunis is estimated to amount to 76,919,000 qr. in 1918, against 67,952,000 qr. in 1917, or an increase of 13.2 per cent. *Oats*.—It is estimated that the total yield in Denmark, Spain, United Kingdom, Italy, Luxemburg, Norway, Netherlands, Sweden, Switzerland, Canada, United States, Japan, and Tunis amounts to 262,581,000 qr. in 1918, against 256,265,000 qr. in 1917, or an increase of 2.5 per cent. *Maize*.—The production in Spain, Italy, Switzerland, Canada,

United States, and Japan is estimated at 313,153,000 qr. in 1918, against 371,100,000 qr. in 1917, or a decrease of 15·6 per cent.

In the Southern Hemisphere the production of wheat in Argentina in 1918-19 is estimated to amount to 23,027,000 qr., against 27,320,000 qr. in 1917-18, or a decrease of 15·7 per cent., and of oats to 4,524,000 qr., against 7,771,000 qr., or a decrease of 41·8 per cent.

Sowing of Winter Cereals in the Northern Hemisphere.—The areas estimated to have been sown with winter *wheat* in 1918-19, compared with the areas sown during the corresponding period of 1917-18, expressed as percentages, are as follows :—Denmark 89, England and Wales 96, Norway 100, Canada 95, United States 116, British India 69 ; with *rye* : Denmark 103, England and Wales 95, Norway 100, United States 102 ; with *barley* : England and Wales 97 ; with *oats* : England and Wales 98.

Spain and the Canary Islands.—According to a report issued in the " Boletín de Agricultura Técnica y Económica " (Madrid) the production of the principal grain crops in 1918 is given as follows, figures for 1917 being given in brackets :—Wheat, Spain, 3,589,800 (3,784,400) tons, and Canary Islands, 33,400 (26,400) tons ; barley, Spain, 1,889,700 (1,632,300) tons, and Canary Islands, 29,000 (24,000) tons ; oats, Spain, 433,600 (470,800) tons ; rye, Spain, 757,600 (602,500) tons, and Canary Islands, 1,875 (1,330) tons ; maize, Spain, 586,600 (716,900) tons, and Canary Islands, 15,400 (15,500) tons. The total acreage in 1918 in Spain and the Canary Islands were—Wheat, 10,206,700 acres ; barley, 4,133,200 acres ; oats, 1,503,500 acres ; rye, 1,817,700 acres ; maize, 1,167,900 acres. (*The London Grain, Seed and Oil Reporter*, 15th March, 1919.)

Canada.—The Dominion Bureau of Statistics gives the acreage and production of the principal crops in 1918 as follows (figures for 1917 being given in brackets) :—Wheat, 189,301,000 (233,742,800) bush. from 19,373,000 (14,755,850) acres, an average yield of 11 (15½) bush. per acre ; oats, 380,273,000 (403,000,000) bush. from 14,790,000 (13,313,000) acres, an average yield of 25½ (30½) bush. per acre ; linseed, 5,972,000 (5,934,000) bush. (*The London Grain, Seed, and Oil Reporter*, 20th February, 1919.)

Australia.—The revised official estimate gives the yield of wheat for the whole of the Commonwealth as 9,381,000 qr., against an earlier estimate of 9,500,000 qr. In 1917 the yield was 14,431,000 qr., and in 1916 18,900,000 qr. (*The London Grain, Seed, and Oil Reporter*, 21st February, 1919.)

South Africa.—According to the December official bulletin for the Union of South Africa there is a decrease of 11 per cent. in the area under maize, following an increase of 5 per cent. last year. A normal yield from the acreage planted would give 5,000,000 qr., which would be considered a full crop. (*Broomhall's Corn Trade News*, 5th March, 1919.)

Live Stock in Denmark.—The number of pigs according to the census of the 10th December, 1918, is 726,844, against 752,711 on the 10th September, 1918, 513,012 on the 5th February, 1918, and 2,496,706 on the 15th July, 1914. (*International Crop Report and Agricultural Statistics*, February, 1919.)

Live Stock in the United States.—The numbers of live stock on agricultural and breeding farms, according to statistics of the 1st January, 1919, are as follows (the corresponding figures on the 1st January, 1918, being shown in brackets):—horses, 21,534,000 (21,555,000); mules, 4,925,000 (4,873,000); milch cows, 23,467,000 (23,310,000); other cattle, 44,399,000 (44,112,000); sheep, 49,863,000 (48,603,000); pigs 75,587,000 (70,978,000). (*International Crop Report and Agricultural Statistics*, February, 1919.)

THE Crop Reporters of the Board, in reporting on the agricultural position on 1st March, state that the wet weather, with occasional severe frost and snow, has greatly delayed cultivation and very little spring sowing has been done. Only during the last days of the month has general progress been possible. Autumn-sown crops have not suffered to any serious extent, and wheat is generally described as healthy and promising, though there has been some deterioration and loss of plant on low-lying, wet land. Probably from one-third to one-half of the crop may need a spring top-dressing. Oats and beans seem to be generally vigorous and promising.

Ewes are healthy, and their condition, though somewhat lowered by the inclement weather, is on the whole fair. Lambing is still in its earlier stages, but so far the fall seems fairly satisfactory. In some few instances the trying conditions have resulted in losses both of ewes and lambs.

Other live stock are healthy, but the shortage of foodstuffs and the severe weather have combined to keep them in moderate, or at best, only fair, condition. The supply of winter keep is getting low in many places, but on the whole seems likely to prove sufficient.

The labour shortage is gradually becoming less acute as demobilisation proceeds, but conditions vary greatly in different districts, some farmers having all the men they need for present requirements, and others being still short-handed. Skilled labour is greatly needed almost everywhere.

THE following local summaries give further details regarding agricultural conditions in the different districts of England and Wales:—

**Agricultural
Labour in
England and Wales
during February.**

Northumberland, Durham, Cumberland, and Westmorland.—The supply of labour varies considerably. In a few districts the supply is very short, but generally there is an improvement, though the demobilised men are not always returning to farm work.

Lancashire and Cheshire.—The situation has somewhat improved, but in some districts the shortage is still most acute.

Yorkshire.—The situation is easier on the whole, but there is still a shortage in many places, especially of horsemen.

Shropshire and Stafford.—The supply of labour is still deficient, but the situation is improving as men are being released from the Army.

Derby, Nottingham, Leicester, and Rutland.—Skilled labour is still scarce, but there is a gradual improvement as men are released from the Army.

Lincoln and Norfolk.—The supply of labour, especially skilled, is still deficient, but the position is slowly improving with the gradual demobilisation of farm workers.

Suffolk, Cambridge, and Huntingdon.—Labour is still mostly deficient, but owing to the return of men from the Army, and the reduced demand on account of the weather, the deficiency has not been acutely felt.

Bedford, Northampton, and Warwick.—On the whole the supply of labour is about sufficient, but skilled men, especially horsemen and cowmen, are very difficult to obtain.

Buckingham, Oxford, and Berkshire.—The position is gradually improving, though the shortage still exists.

Worcester, Hereford, and Gloucester.—The supply of labour appears to have been adequate during the bad weather, and is improving in a number of districts. There is, however, a good demand for skilled workers.

Cornwall, Devon, and Somerset.—The scarcity has been less felt on the whole, but there is still great need of skilled hands, especially horsemen.

Dorset, Wiltshire, and Hampshire.—Labour is still deficient, though there is enough for present requirements. There is a shortage of casual labour in several districts, but the general position is improving.

Surrey, Kent, and Sussex.—The situation is gradually improving, but there is still a shortage, especially of skilled men.

Essex, Hertford, and Middlesex.—Labour is rather more plentiful in most districts, and is generally sufficient to meet present requirements. Skilled workers are still reported to be scarce in some parts.

North Wales.—The supply of labour varies considerably. In some districts there is a sufficient supply for present requirements, while in others there is still a deficiency. Skilled workers are needed more especially.

Mid. Wales.—The release of men from the Army is easing the situation, but there is still a shortage of skilled men in some districts.

South Wales.—The supply of labour though sufficient in some districts, is very short in others, demobilised soldiers are in many cases not returning to the farms.

SELECTED CONTENTS OF PERIODICALS.

Agriculture, General and Miscellaneous—

- Rural Economy of France, *H. M. Conacher*. (Scot. Jour. Agric., October, 1918.) [63.44.]
- Recent Investigations on Soil Aeration, Pt. I., with Special Reference to Agriculture, *A. Howard*; Pt. II., with Special Reference to Forestry, *R. S. Hole*, (Indian Forester, May, 1918). [63.112; 63.49-11.]
- Ueber die Bedeutung des Kalks für die Ernährung der Pflanzen, Tiere und Menschen, *O. Loew*. (Natur. Zeit. für Forst u. Land., September-Okt., 1918.) [612.394; 63.161.]
- The Solubility of the Soil Potash in Various Salt Solutions, *D. K. Tressler*, (Soil Science, September, 1918.) [63.1673.]
- Soil Acidity as affected by Moisture Conditions of the Soil, *S. D. Conner*, (Jour. Agric. Research, 11th November, 1918.) [63.113.]
- Determining the Absolute Salt Contents of Soils by Means of the Freezing-Point Method, *G. J. Bouyoucos* and *M. M. McCool*. (Jour. Agric. Research, 11th November, 1918.) [63.113.]
- Agriculture and Agricultural Education in Canada, *A. E. V. Richardson*. (Jour. Dept. Agric. Victoria, October, 1918.) [37(71).]

Plant Diseases—

- Seed Tuber Treatments for Potatoes, *G. H. Coons*. (Phytopathology, September, 1918.) [63.294.]
- Der Maulwurf als Waldtier, *W. Schuster*. (Allg. Forst. u. Jagd. Zeit., Juli, 1918.) [63.269; 63.49-2.]
- A Short Summary of our Knowledge of the Frit Fly, *J. E. Collin*. (Ann. Appl. Biol., October, 1918.) [63.27.]
- Physiological Pre-determination: the Influence of the Physiological Condition of the Seed upon the Course of Subsequent Growth and upon the Yield: II. Review of Literature, Chapter I. *F. Kidd* and *C. West*. (Ann. Appl. Biol., October, 1918.) [58.11; 63.1951.]
- The Use of Lime in Controlling Finger-and-Toe in Turnips, *Prof. J. Hendrick*. (Trans., Highland & Agric. Soc., Scot., 5th Ser., Vol. XXX., 1918.) [63.24.]

Live Stock—

- The Composition and Food Value of Bracken Rhizomes, *Prof. J. Hendrick*. (Scot. Jour. Agric., October, 1918.) [63.259; 63.604(a).]
- Studies in Inheritance of Certain Characters of Crosses between Dairy and Beef Breeds of Cattle, *J. W. Gowan*. (Jour. Agric. Research, 7th October, 1918.) [63.603; 63.62(4).]
- British Friesian Cattle, *G. Hobson*. (Trans. Highland & Agric. Soc., Scot., 5th Ser., Vol. XXX., 1918.) [63.62.]
- Net Energy Values of Alfalfa Hay and of Starch, *H. P. Armsby* and *J. August Fries*. (Jour. Agric. Research, 4th November, 1918.) [63.604(a).]
- Composition et teneur en matières digestibles des Aliments du bétail, *A. Mallevre*. (Ann. Sci. Agron. Avril-Juin, 1918.) [63.604.]

Field Crops—

- Industrial and Nutritive Value of the Potato in Ireland, *T. Johnson* and *C. Boyle*. (Jour. Dept. Agric., Ireland, Vol. XVIII., No. 4, 1918.) [63.344; 63.512(4).]
- Cereal Improvement at Svalöf, *W. J. Prossitt*. (Scot. Jour. Agric., October, 1918.) [63.31(4); 575.4.]
- National Aspects of a Guaranteed Minimum Price for Wheat and suggested Basis for its Equitable Determination, *Hon. A. J. Perkins*. (Jour. Agric., S. Australia, October, 1918.) [63.311; 31.]

Engineering—

- Notes on Wedge and Shoulder Drains, *G. W. Constable* and *W. Elliot*. (Trans., Highland & Agric. Soc., Scot., 5th Ser., Vol. XXX., 1918.) [63.14(4).]
- Demonstration of Tractors and Ploughs. (Trans., Highland & Agric. Soc. Scot., 5th Ser., Vol. XXX., 1918.) [63.175.]
